EDITOR'S SCIENTIFIC RECORD.

Practical Application of the Translucency of Metals, 146. Conversion of Tallow into Butter, 147. Magnesia Light in Photography, 147. Transfusion of Blood, 147. Pokorny's Ice-Machine, 147. Artificial Coral, 147. Curious Shape of Birds' Bills, 147. Arctic Vegetation, 148. Hibernation of Duck-Weed, 148. Economical Manufacture of Oxygen, 148. Native Sulphur in the West Indies, 148. Discovery of Native Lead, 148. Great Heat from Steam, 148. Infusion of Coal and Chalk, 148. Glacier Action about New Haven, 149. New Test for Arsenic, 149. Ocean Currents, 149. Rhea, or China Grass, 150. Coloring Matter in Coal Tar, 150. Rendering Wood Fire-Proof, 150. Albotype Printing, 151. Poisonous Coloring of Fruit Sirups, 151. Removal of Organic Substances from Water, 151. Protection to Walls and Chimneys, 151. Flies, 152. Bisulphite of Lime, 152. New Method of Desiccation, 152. Nesting-Place of Penguins, 152. Thatching Machine, 152. Artificial Rubber, 152. Removal of Husk from Grain, 152. Spots on the Sun, 152. Preparation of Fruit Sirups

and Preserves, 305. Confusion of Names in Natural History, 305. Effect of the Food of Cows on their Milk, 306. Fertile Cross between American Elk and European Red Deer, 306. Stone Images on Easter Island, 306. Relationships of the Aurora, 306. Preparation of Lamb and Rabbit Skins, 306. Varying Density of the Earth's Crust, 307. Cure for Obesity, 307. Domestication of the Horse and the Ass, 307. Life Buoy, 307. Draining Wet Spots, 307. Removal of Grease from Marble, 307. The ancient Mammalian Fauna of Europe and Asia, 308. Specimens Extant of the Great Auk, 308. Fisheries of the North Atlantic, 308. Albolite Cement, 309. Character of Northern Sea Bottom, 309. Method of Destroying Aphides, 309. Monosulphite of Lime in making Sugar, 309. Action of Maltine, 310. The Pascal-Newton Forgeries, 310. Whitening Smoked Walls, 310. Rendering Articles Water-Proof, 310. Coast Survey Dredging off the Florida Coast, 310. Changes in Jupiter, 311. Unbolted Flour, 464. Goma Oil, 464. Safety Petroleum Lamp, 464. Plesiosaurus in Aus-

EDITOR'S SCIENTIFIC RECORD—Continued.

tralia, 464. Easy Method of Breaking Large Masses of Cast Iron, 465. Test for Purity of Water, 465. Sonorous Charcoal, 465. Artificial Gold, 465. Imparting an Artificial Flavor to Fruit, 465. Methylated Ether as an Intoxicant, 465. Change of Habit in Swallows, 465. Hard Water for Drinking Purposes, 465. Significance of Wide Distribution of Species, 466. Dredgings of the Porcupine, 466. Extraction of Vegetable Alkaloids, 466. Locusts in a Telescopic Field, 467. Fossil Birds, 467. Variegated Leaves, 467. African Meteorite, 467. Chlorophyll Grains, 467. Delaunay's Tables of the Moon, 467. Fossil Birds of France, 467. Animal Substances of the *Materia Medica*, 467. Asparagus Seeds as a Substitute for Coffee, 468. Use of Charcoal in Fattening Turkeys, 468. Decay of Stone Buildings in Cities, 468. Sinking of the Channel Islands, 468. Preparation of Carbonic Acid, 468. A Harmless Green for Pickles, etc., 468. Applications of Infusorial Earth, 469. Ornithopsis—a Fossil Link between Birds and Reptiles, 469. Poisonous Nature of Phenyl Substances, 469. Extinction of Small Birds in New Zealand, 469. Ancient Shell-Heaps in Wales, 469. Phosphate Beds in South Carolina, 470. Guarana—a new Stimulant, 470. Fossil Feather, 470. Ozone, 470. Change of Climate of France, 471. Freezing of Plants, 471. Preservation of Lime Juice, 471. Conductibility of Bodies for Heat and for Electricity, 471. Cruise of the Porcupine in 1870, 471. Occurrence of Marine Forms of Animals in the Great Lakes, 626. Germination of Seeds, 626. Cleaning Kid Gloves, 626. Horsetooth Corn, 627. Exhalation of Ammonia by Mushroom, 627. Selenium in Commercial Copper, 627. Canine Madness, 627. Commensalism, 627. Petrification of Tissues, 628. Detection of Brain Diseases, 628. Transmission of Nerve Force, 628. Chemical Intensity of Total Daylight, 628. New Link between Reptiles and Birds, 628. Influence of Cerebral and Muscular Action on the Urine, 628. Blue Color of the Sky, 629. Method of covering a Bank of Earth with Grass, 629. Color of Larval Salamanders, 629. Extraction of Sugar from Molasses, 629. Development of Heat by Nerve Action, 629. Identity of Betain and Oxyneurin, 629. Decorative Painting, 629. Compounds of Gelatine and Glycerine, 630. Cause of Variegation of Leaves, 630. Tin Cans, 630. Spectroscopic Examination of Candle-Flame, 630. Head Lettuce, 630. Counter-pressure Steam-Brake for Locomotives, 630. Diseases of the Silk-Worm, 631. Eclipse of the Sun in December, 1870, 631. New Silk-worm Parasite, 631. Adulteration of Vinegar by Sulphuric Acid, 631. Mica Spectacles, 632. Waxed Paper, 632. Ignorance of Blue

among the Ancients, 632. Treatment of Zinc White, 632. Temperature of New-born Infants, 632. Bite of Vampire Bats, 632. New Glazing Putty, 633. Bromide of Potassium, 633. Koertling's Method of Relief Printing, 787. White-Lead, 787. Best Colors for Signal Lights, 787. Cold Period in Europe, 787. Copying Old Writings, 788. Closing Cracks in Stoves, 788. The Heaton Process of Manufacturing Steel, 788. Connection of Meteorological Conditions and Disease, 789. Fossil Mammals in China, 789. The Fossil Pedigree of the Horse, 789. General Constituents of Meteorites, 789. Improved Envelopes, 789. Peruvian Maize, 789. Tree of Rapid Growth, 790. Hydraulic Mortar, 790. Albortype Printing, 790. Preparation for softening Leather, 790. Luminous Flames and Sound, 790. Electric Light in Photography, 791. Removal of Phosphorus from Iron Ores, 791. Sirup of Hydrate of Chloral, 791. Flight of Winged Animals, 791. Best Mode of applying Coralline, 791. Influence of Ozone on Nitro-Glycerine, etc., 792. Oxygenated Bread, 792. Domestication of the Reindeer in the Reindeer Period, 792. Cleaning Printed Sheets, 792. Labels for Outdoor Plants, 792. Whitening Linen, 792. Flight of Birds and Insects, 936. Physiological Action of Meat Extracts, 937. Aroma of Coffee, 937. Living Organisms in Chalk, 937. Natural Gas Fountain, 938. Secretion of Sulphuric Acid by Mollusks, 938. Preparation of Hydrogen, 938. Sinking of the Andaman Islands, 938. Prizes paid for Improvement in Paraffine Manufacture, 938. Red Color from Picric Acid, 938. Cutaneous Absorption, 939. Society for Assisting Destitute Men of Science, 939. Composition of the Skin of Animals, 939. Amelioration of the Climate of Savoy, 939. Friction of Iron on Ice, 939. Purification of Water by Freezing, 939. Increased Heat of the Sun's Rays in passing through Clouds, 940. Cannibalism in Ancient Europe, 940. Inhabitants of Madagascar, 940. Variation in Plants with Soil, etc., 940. Agency of Humming-Birds in fertilizing Plants, 940. Flora of Iceland, 941. Keeping Rose-Buds Fresh in Winter, 941. Relation of Barberry Plant to Rust in Grain, 941. Treatment of Brittle Bones by Soluble Glass, 941. Relation of Home Government to Science, 941. Preservation of Harbors by Torpedoes, 942. Value of Bamboo as a Fibre, 942. Huxley on the Early Inhabitants of Great Britain, 942. Physics of the Suez and Darien Canals, 942. Best Form of Submarine Torpedoes, 943. Loss of Light in Reflection from Mirrors, 943. Eucalyptus—A Remedy for Intermittent Fever, 943. Curious Habits of Brazilian Fishes, 943. Sounds of Insects, 944. White Coating on Prunes, 944.

ELECTRIC LIGHT, THE.....Jacob Abbott 354

ILLUSTRATIONS.

Stage Effects of the Electric Light.....	354	Magneto-Electric Machine.....	356
Principle of the Regulator.....	355	The Electric Microscope.....	357

JOTTINGS AND JOURNEYINGS IN SPAIN.

ARCADIE EN ESPAGNE.

"SPAIN," said Talleyrand, "is a country in which two and two make five." Seeming so to a Frenchman, an American might be pardoned if he believed it a land in which two and two made six, or any other number. Ancient Iberia is certainly a region of the unexpected. It is full of surprises and disappointments. Nothing ever happens there as one supposes it will, and the knowledge of to-day is ever contradicted by the experience of tomorrow. For more than three centuries the country has been an enigma, politically, religiously, and socially, that no other European nation could solve; and its present condition augments its anomaly. Where else could we hope to find a queen without a dominion, and a kingdom without a king? They who have never visited Spain may wonder; but those who have been there will be incapable of new surprises.

The land where "yes" means "no," and "immediately" "next week"—where inn-keepers assure you they have every delicacy, when they know they are besieged by starvation—where there are rivers without bridges, and bridges without rivers—where highwaymen rob you of your last escudo, and then piously commend your soul to God—where "princely hospitality" signifies fleas for bed-fellows and garlic for breakfast—the land where are all these and many other contradictions soon prepares you for whatever may happen.

Land of romance and superstition, of chivalry and bigotry, of Lope de Vega and Cervantes, of Cortéz and the Cid, of Moorish refinement and Gothic rudeness, of the Alhambra and the Inquisition, of heroism and persecution, of art and assassination, of poetry and intrigue, of splendor and squalor, we have all, at some time, built

Entered according to Act of Congress, in the year 1870, by Harper and Brothers, in the Clerk's Office of the District Court of the United States, for the Southern District of New York.

VOL. XLI.—No. 241.—1

THE RAILWAY CARRIAGE.

gorgeous castles upon your mountain-sides, and viewed with rapture our broad estates watered by the Xenil and Guadalquivir. We shall never see you as you appeared to us in our youthful dreams, for the outward eye dispels the visions of imagination ruthlessly and forever. Your moonlight will never fall so soft, even in Andalusia, nor your guitars drop such sweetness, though under the towers of Seville, as came to us when reverie blossomed in the rich soil of the heart. The splendors of Cordova's cathedral will lessen when we stand in its marble aisles; and the nightingales will never fill the evening with such music as they did before our wandering feet had borne us to the ancient palace of the Moorish kings.

When I first went whirling over the soil (in America we should call it creeping), in the midst of cigarette-smoke that made the compartment look like a miniature edition of the Blue Grotto of Capri, and when, trying to smile serenely at the three sallow *caballeros* opposite, who sat dignifiedly smoking me to death, I heard at the stations, "Valladolid," "Madrid," "Seville," "Granada," roared out in gutturals fragrant with garlic, my noble castles crumbled, and the raw wind of the Sierras swept down and chilled my buds of sentiment to death.

If quite different from what fancy and romance had painted it, I was very glad to see Spain, and my memory of it is still most welcome. Three things I have found needful to a satisfactory visit—patience, politeness, and *pe-setas*.

Armed with these, I could be mildly seraphic

on trains that seemed as if they would never start, and could inquire unmoved for "accommodations" at the homeliest *posada*.

As all travelers know, the impression a strange country makes depends largely on what they see first—on the way they enter it. To visit Spain advantageously it is best to go, as I did, from France across the Pyrenees, instead of going, as many do, from Cadiz through picturesque Andalusia to the less favored provinces, ending with the dreariness and sterility of the Castiles. No two cities on the Continent are more different than Paris and Madrid; and such quaint and curious towns as Vittoria, Burgos, and Valladolid prepared me for the strange kingdom I had entered.

No person need be told when he has crossed the confines of the French empire. Having done so, I saw at once I was among another people—almost in another world. No more the vivacious and mercurial manner of the Gaul greeted me; but in its stead the grave and measured deportment of the representative of half a dozen races. The train on which I traveled, though the creation of French capital, seemed affected by the soil and atmosphere of Spain. Its speed was retarded; it was hampered with delays at every station; it became the victim of endless formalities that threatened never to untangle themselves. I discovered I must undergo a certain acclimating process of mind as well as of body. The mood and bearing that had served me elsewhere on the Continent would not support me there. I had found that pretended loss of temper and assumed vio-

lence of manner are beneficial in France, Germany, and Italy; but in Spain they only defeat the tourist's ends.

Peninsular travel is favorable to one of the highest Christian virtues, resignation. This is less difficult to practice the moment one discovers it is absolutely necessary. Job would have found his sphere in Spain; at least, the need of exercising his characteristic quality. If the patient are the strong, they who have "done" Spain should have few weaknesses. I am confident that I have an outward calmness and a degree of self-discipline I never owned before I crossed the Pyrenees. I have had my patience tried all the way from Pamplona to Cadiz, from Badajoz to Barcelona, and though I may have lost my temper, I never advertised for its return. Spanish officials are often very provoking; but they won't be hurried, and can't be bullied to advantage. Inn-keepers hold as an article of faith that their patrons are immortal, and that a breakfast ordered at eight in the morning will answer quite as well at the same hour in the evening. But if you use even such mild and allowable oaths as *Carai*, *Caramba*, or *Vaga usted al demonio*, you will not help your case. Show a certain energy in politeness, a perseverance of courtesy, and you will be duly rewarded.

I remember at Valladolid that, after ordering a bottle of wine again and again at the Fonda Universal, and failing to get it in four hours, I sent for the host, and told him I supposed his crowded house (it had but two more visitors besides myself) prevented him from attending to me, but that if he would not keep me waiting more than six hours longer, I should esteem him the noblest of gentlemen. The wine came within five minutes, and afterward I had no further cause to complain of delay.

In driving about Burgos I could not induce my *calesero* to go beyond a snail's pace until I told him I was in no haste whatever, but that his mule was walking in his sleep, and might fall and hurt himself. He replied, "*Muchas gracias, Señor*," and whipped up in fine style for the remainder of the afternoon.

As respects manners, the Spaniards deem themselves the politest people on the planet, of which they think Spain much the best and by far the most important part. If manners do not make the man on the Peninsula, they go far toward insuring his comfort or its opposite. The natives are certainly managed by manners. Any departure from civility, however small, is always resented, and strict observation of it attended with remunerative results. One of their proverbs, "Politeness gets what money can't purchase," experience has often taught me the truth of. The Spaniards, naturally courteous, expect courtesy from others, and appreciate it to the fullest. When you travel, never light a cigar or cigarette without offering one to those in the same carriage. They won't take it unless urged; but it is the custom of the country; it shows you are

a man of the world and of good-breeding. A Spaniard always refuses once—that is etiquette—and you must do likewise; but when he is invited a second time he accepts. At a café or restaurant, if you order coffee, chocolate, or wine, breakfast or dinner, and there are persons at the same table, invite them to join you. It will cost you nothing, for they won't do it; but the invitation will advance you in their estimation.

Lifting the hat when entering the presence of others is more imperative in Spain than in France or Italy. Not to do so in a diligencia, railway coach, or a room, is thought a violation of good-manners, if not a positive offense. I have seen sensitive Castilians look angry, even fierce, and twirl their mustache with offended dignity, when foreigners neglected to raise their hats. But when the careless persons remembered, and complied with the demand of etiquette, the sallow faces relaxed, and a gleam of good-humor darted out of the jet-black eyes. Hat-lifting and cigar-giving are passports to good treatment every where. Many strangers have made fast friends by such simple means. Should I be sent to Madrid on a diplomatic mission, I should engage a servant specially to elevate my sombrero, and a tobaccoist to supply me constantly with the best of Havanas. By liberal use of both, I think I could manage the ministers as well as the Cortes.

The inhabitants of the different provinces, though they know and care little about each other, all consider themselves Spaniards, and as such are jealous of their dignity and reputation. They are very nice as to their personal honor (*pundonor*), and regard themselves as gentlemen, whatever their station in life, and the peer of any foreigner, be his position or rank what it may. They often appear cold and reserved; but they are easily won, and once conciliated are extremely obliging. Etiquette is very rigid with them, and never departed from in public. When you visit any one formally the proper costume is black, as it is with us. If the person you have called on be out, you write on the corner of your card E. P. (*en persona*), and leave it with the servant. First visits demand marked courtesy, which means nothing unless it is repeated at the second visit. If you are welcome you will be conducted to the best room, placed on the right-hand of the sofa, and your hat treated with as much consideration as yourself, your host seizing it ardently and placing it on a vacant chair. As you take leave of a lady you say, "I hurl myself at your feet, Madam" (*A los pies de usted, Señora*); and she responds, with an eloquent casting down of the eyelids and a graceful sweep of her fan, "I kiss your hand, Sir" (*Beso á usted la mano, Señor*), for the reason, perhaps, that neither you nor she intend to do any thing of the kind. Then she looks tender, and uses the phrase, "May you depart with God, and continue well" (*Vaga usted con Dios que usted lo pase bien*)!

ON THE PROMENADE, MADRID.

Whereupon you assume a theologically gallant air—to be acquired only in Spain—and reply, “May you remain with God” (*Quede usted con Dios*)!

The name of the Deity occupies a very prominent place in Peninsular phraseology, and is employed under a variety of circumstances. Your dearest friend intrusts you to the Divine keeping as he folds you in his embrace; and the robber does the same when he points his blunderbuss at your head, and gently requests you to stand and deliver.

Men are treated very differently from women by Spanish ladies. These seldom rise on re-

ceiving the former, or offer their hand, or accept the arm of their escort; but they kiss the latter at coming and going. The striking contrast is thought to arise from inherent feminine coquettishness, the dark-eyed Castilians desiring to show men what delights they are debarred from by reason of their sex. One of the reasons assigned by the women for not giving their hand to their masculine friends is, that the doing so disarranges their mantilla; and another, that it is likely to be mistaken for a matrimonial intention. The Spanish men, who are always saying ill-natured and cynical things about the other sex, declare the mantilla is a

A FLIRTATION IN A WAY-SIDE POSADA.

much more serious matter than marriage ; that an ill-fitting garment is more difficult to manage than a poor husband.

Unless a Spaniard presses you again and again to repeat your visit, and assures you his house is yours, and it and all it contains at your disposal, you can conclude you are not welcome ; that you have not created a favorable impression. Birthdays are made much of, and when they occur formal visits are expected. New-Year's is devoted to calls, as on this side of the sea, and presents, remarkable for their fitness rather than value, are often made to those on whom you call.

It is etiquette to avoid the appearance of being alone with a lady within doors ; so that on entering a drawing-room you must leave the door open, or at least ajar, if she be unattended. Spaniards are jealous and suspicious, and inclined to put the worst construction upon appearances and opportunities. They never trust their women ; and for that reason, no doubt, are often deceived. It is the tendency of our nature to be no better than the opinion held of us.

I have found it wholly beneath the Iberian dignity to be in haste ; and as the people have little to do, and less inclination to do it, no one

is concerned about time. Business, in our sense, is either unknown or thought a foreign innovation; and all engagements in the Peninsula are kept as loosely as some of the Commandments. The Spanish are very reserved and taciturn to strangers; but with their acquaintances they are confidential and talkative. One of the penalties of Peninsular friendship is the amount of time required for its sustenance. To pass your friend in the *prado* or *alameda* with a single nod and "good-morning" would be an offense. You must not only stop; you must inquire with many high-flown compliments after his health, that of his wife, his children, and all his near relatives. Unless you exercise some energy, you will be kept a quarter of an hour or more in idle talk; or, perhaps, be carried off to a *café* to drink a cup of chocolate or a bottle of wine, and discuss the news and scandal of the day. If you meet him near your hotel or lodging-house, you must invite him in, though he is not expected to enter. Should you undertake a luncheon or dinner in the house of a friend, eat heartily if you would stand well with him, even if your appetite revolts. You can never convince your host you appreciate his hospitality unless you consume a certain amount of food.

The American custom of paying for your acquaintances in a *café* or restaurant prevails in Spain, though nowhere else on the Continent. You have more latitude there than here; for you have the privilege of settling the bills of ladies you don't know, if you like their appearance, by informing the waiter privately that such is your intention. Formerly gentlemen who went on shopping expeditions were in the habit of paying for every thing their fair friends bought, so that gallantry became an expensive luxury. It used to be said in Andalusia, where women are more coquettish and extravagant than in the North, that a long purse was needed for a short walk with a lady. The custom is quite obsolete now; and she who allows you to make purchases for her is supposed to be devoid of high-breeding, if not of unexceptional morals. They say in Seville, "Women who receive money never pay in the same coin."

In the fact that *pesetas* render excellent service Spain is not different from the rest of Europe. In Great Britain, France, Italy, and Germany you receive perpetual intimations to open your purse; but on the Peninsula you are often led to infer that what you want can't be had on any account. You are constantly met with *Quien sabe? Es imposible; Eso ne puede ser*; and the phrases are accompanied with so much gravity and such apparent sincerity that you are inclined to believe them true. But they are merely designed to heighten the effect of removing the difficulties that stand in the way of your pleasure. A few *pesetas* will melt the most formidable obstacles. The silver key unlocks galleries, churches, palaces, monasteries, and the secretest of all secret chambers.

We Anglo-Saxons think time is money. The Iberians hold time as nothing, money as every thing. They have an aphorism, somewhat cynical of course: "When the heart is dead to love, it hears the clink of coin and dances to its tune." If a Spaniard of the lower order could be energetic, in an American sense, he would be so before the vision of a purse from which he had hopes. He undergoes a revolution when he has been feed. His face loses its grimness after his palm has been crossed with silver, and he no longer persecutes you with the national *Quien sabe?* which is intended to have the force of an overwhelming negative. He who journeys beyond the Pyrenees, and begrudges custodians and servants their *propina*, puts clogs on his feet and scales before his eyes. A judicious and enlightened employment of money has been to me the best guide. It opened doors that had grown rusty on their hinges, and revealed to me what I should never have suspected. Never fear from the high dignity of an official that he will be offended at the offer of money. If he deems it an insult, he will pocket it and be silent.

Since the introduction of railways, which, being built, as I have said, by the French, are not the natural outgrowth of the country, and are far in advance of the time, the character of travel is very different from what it was. Railways are destructive to romance and variety of character; but away from the large cities and off the beaten paths, diligencias, muleteers, *Maragatos*, and the *coches de colleras* still appeared to me with all their peculiar surroundings. Whenever I could, without serious inconvenience, travel in the old-fashioned and picturesque way, I always did; and I was largely the gainer by it, for I saw the people, and their customs and peculiarities, as I could never have done otherwise.

If one could devote two or three years to Spain, and were as indifferent to physical discomfort as the natives, he might take a horse, or rather mule—the national animal—and go in pursuit of adventures after the manner of La Mancha's knight. Some time I may don a *sombrero*, a *zamarra* (fur jacket), the indispensable *alforjas* (saddle-bags), in which a Spaniard carries every thing, and, mounted on an Andalusian steed, accomplish the geography of the Peninsula. But before I undertake that I will describe what I have already seen.

Every body who does not go by rail travels by diligencia in Spain, where private conveyances are almost unknown. When royalty existed there it was content with the diligencia. Don Francisco de Paula, the Infante, so transported himself and his family from the capital to the sea-coast; and the reason Don Enrique gave for not going to Madrid to marry the Queen was, that he found it impossible to secure a place in the vehicle. The diligencia is lumbering and ungainly enough; but it furnishes far better company than in France or Italy. I always felt as if I had slipped back to the early part of the century when I found myself rum-

bling over the Castiles or Granada, inhaling cigarette smoke, dreaming under the soft night of *la bella incognita's* eyes, or watching the movements of the *mayoral* (guard), who, armed to the teeth, would pass, without the least change, for José Maria himself. The guard, like the mounted escort, is usually a retired robber who has been pardoned and pensioned, and would gladly return to his purse-taking if it were as profitable as it used to be. No doubt there is often an understanding between the guard and escort and the gentlemen of the road (in Spain, as in the United States, every body claims to be a gentleman, and stealing and throat-cutting are not considered bars to the distinction); and this understanding prevents the plundering of passengers, except in isolated instances. Diligencias are sometimes four or five days and nights on the road; and as all the passengers are locked up together, and as Spaniards of both sexes are very susceptible to good-humor, politeness, or a proverb, a person of a philosophical turn of mind has an excellent opportunity to study manners, character, and costumes. The way-side inns are rarely good; but a *gratificacióncita* will thicken the chocolate, improve the salad, increase the freshness of the eggs, and whiten the bed-linen amazingly. Various have been the comedies and melodramas that have had the diligencia for a stage; and the haps and mishaps at the *posadas* furnish variety and zest to the journey, as bacon does to the famous *olla podrida*.

Muleteers are not to be separated from Spain, though they are steadily disappearing before the whistle of the locomotive. They represent the genuine character of the country; seem half Moorish, and are called *arrieros*, from their *arre*, *arre*, which corresponds to our "gee up, gee up." I should not have seen Ronda and Granada to advantage without the assistance of the muleteer, who, being constantly on the road, knows every thing that is occurring, and collects a fund of facts and gossip that is invaluable to the traveler. A more careless, independent, happy-go-lucky fellow than the *arriero* I have not found on the Continent. Walking by the side of his patient beasts, or sitting upon his cargo, with his legs hanging over the neck of one of the animals, listening to the disagreeable monotony of the leader's wooden-clattered bell, or singing dismally a dismal ditty, he was to me the type of the peculiar civilization that surrounds him. He smokes and swears and sings by turns; carries his guitar and his gun, and is ready alike for business gay or business grave, for a serenade or a homicide. The guitar and the gun, which are seen together in the Asturias no less than in Granada, and which no Spaniard can get along without, reveal the softness and the sternness, the tenderness and the cruelty, the gallant and the revengeful traits of the national character.

The muleteer is at bottom a fellow of sterling qualities—honest, industrious, and good-natured, unless affronted, when he becomes, from

his stubborn courage and sinewy frame, a formidable enemy. The landscape of the country will lack completeness when it loses the muleteers. They make much of its picturesqueness as they go up the zigzag mountain-paths, now disappearing, now reappearing, and fill the gloomy defiles and aromatic valleys with rude tinkling bells and discordant tunes. Singing seems their favorite occupation; their fondness for vocal exercise arising possibly from superstition (ineradicable from the soil), which holds that singing frightens away evil. If evil owns an ear, especially a cultivated ear, it would naturally be alarmed at the high-pitched, shattered notes of the *arriero*, who, like many lovers of the interdicted, sings much because he ought not to sing at all. Spain is not a land of melody as Italy is. The voices of the peasants are generally harsh; and the bells, so silvery sweet among the Apennines, are clangorous and grating beyond the Pyrenees.

A singular species of muleteer I found to be the Maragato, whose head-quarters are at San Roman in Astorga. He preserves his costume, customs, and mode of life like the Jew and gipsy. His origin is questionable; he does not know it himself; but he seems to be a kind of Bedouin, to whom a mule supplies the place of a camel. He is the medium of traffic between Galicia and the Castiles; wears leather jerkins, cloth gaiters, red garters, and a slouching hat, such as is seen in Rembrandt's pictures of the Dutch burgomasters, whom indeed he much resembles. The attire of the woman—Maragata—is still more unique, wearing, when she is married, a crescent-shaped head-dress that looks very Moorish. She has her hair unconfined and falling over her shoulders, her bodice cut square on the bosom, and her petticoat, resembling an apron, hangs loosely, is open before and behind, and confined at the back with a bright-colored sash. She is very fond of jewelry and ornaments, and tricks herself out on gala days with huge ear-rings, chains of metal and coral, medals, crosses, relics, and whatever she thinks will assist to make her superb. She is a very Oriental and picturesque-looking creature in what is considered full dress, and suggests both the Greek peasant and the Barbary Jewess.

I was fortunate in witnessing a wedding, which is a very formal and solemn occasion among the Maragatos, and is deemed as momentous there as when celebrated in Fifth Avenue, with all the surroundings that tinsel and tintinnabulation can lend. I was informed that those who enter into the state hold it to be the most serious step in life, partaking deeply of a religious character. The ceremonies were peculiar, and accompanied with a feast. Many were bidden, and no one absented himself without good reason; for it is considered an offense to remain away. When the guests were all assembled, some one was chosen to preside, and the president put into an open dish any sum of money he chose. All the other men were

A MOTHER INVOKING A BLESSING ON HER CHILD.

compelled to give the same amount, and the total was handed to the bride as a gift.

They have not learned yet to advertise the contribution and the names of the contributors in the newspapers; but that fine custom will come no doubt with larger enlightenment, when they have achieved our own republican simplicity of manner. The bride was attired in a sombre mantle that covered her like a pall, to which, as she never smiled or displayed the least gayety while under its folds, it may fitly be compared. She wore it all day, and was never to put it on again, I was told, until her husband's death, when it would serve for a garment of mourning. Though invited by every one, she did not dance on the day of the ceremony, always declining very gravely with the words, "Not on such an occasion as this." At sunrise the next morning two roasted chickens were brought to the bedside of the married pair, and were eaten without rising, in the presence of witnesses, to typify that their lives were united, and that they were thereafter to have every thing in common. The same evening there was a ball, which was opened by the bride and bridegroom; but the dance was so slow and serious that it hardly deserved the name.

The Maragatos are a melancholy people, and take all their pleasures and recreations as seriously as if they had been born in America. They can be seen any day with their files of Leon mules—the best in Spain—walking along the dusty highway to La Coruña, swearing and hurling stones in true *arriero* style at their patient beasts. They are much less profane than the other muleteers; but the entire class believe violation of the Third Commandment essential to their calling. They assured me that it is impossible to manage a mule without swearing, and have a saying that an ass's ears are made long to catch oaths.

The Maragatos seemed to me the least polite of the inhabitants of the Peninsula, and to have a greater dislike to "outside barbarians" than any of their countrymen, all of whom hold foreigners as quite superfluous in the plan of creation. It may be for this reason that the Maragatos make no effort to prevent their mules from brushing wayfarers or horsemen over the declivities of the mountain-paths, with the projecting baggage strapped on their backs. If they succeeded in crowding a man off in that manner, I doubt if they would stop to learn the consequences, but would comfort themselves with the thought that no foreigner had a right to interfere with the progress of a well-conditioned mule.

The *coche de colleras* (coach of horse-collars) is passing away, but I saw and tried it several times in the rural districts and on the public roads, at a distance from the large cities. It is very like the English lumbering vehicle of Queen Anne's time, and the French equipage so shapelessly conspicuous in France during Louis XIV.'s reign, and which we still see in

Vandermeulen's pictures representing the state-journeys of the pretentious monarch, and in the specimens preserved in the Hôtel de Cluny. The *coche* is as tawdry, awkward, and uncomfortable as any *hidalgo* could desire, and so harmonious with the character and claims of many of the inflated old Dons that I do not wonder they have been loth to its surrender. It suggests the sixteenth or seventeenth century creeping through the nineteenth; but is much less an anachronism in Spain than it would be any where else.

The *coche*, drawn by six horses or mules, is under the guidance and direction of the master and his assistant (*mozo*), both of whom are often fantastically attired in high-peaked hats worn over a bright-colored handkerchief fastened after the manner of a turban, a gay embroidered jacket, plush breeches, a red or yellow sash, and shoes of undressed leather. In the sash is the *navaja* (knife) that all the peasants carry, for ordinary and extraordinary use, for pacific and hostile purposes.

No Spaniard of the humbler class is without his knife. He is enamored of offensive weapons, seldom going any where without his gun, and never parting company with his blade. He is very dextrous with the *navaja*. In his hands it is a formidable weapon. He wields it like a gladiator; can hurl it with precision, and drive the blade into a post or a man at a distance generally reckoned safe. He is extremely ignorant of anatomy as a science; but he understands it socially; that is, he knows the exact spot at which to aim a mortal blow, and can reach the heart of his adversary as quickly and surely as any surgeon.

The *mozo*, often called *el zagal* (strong youth), is one of the most energetic of Iberian natures. He is a thorough factotum, and seems incapable of fatigue. One of his most important duties is to pick up stones on the highway (all mules on the Peninsula are driven by stones), and discharge them at the beasts during the journey. With this lapidaceous ammunition he is perpetually supplied, and yet he uses it as lavishly as raw recruits do their cartridges at their first engagement. He is probably the most accomplished swearer of the whole Jehu class, who are all proficient enough to have a cerulean influence on the atmosphere. The variety and extent of his oaths are astonishing; but he makes no account of his superiority in this regard, and is, I suspect, quite unconscious of his genius for the profane. There is no saint in the calendar and no evil in the Decalogue he does not couple. He anathematizes all created things, and if his invocations were answered he would bring down the universe in fragments upon his irreverent head. The ideal and exemplar of the *mozo* is the *mayoral*. To be regularly perched on the box and be intrusted with the exclusive guidance of six mules is his highest aspiration, and he believes, with a sort of quadrupedal and vehicular theology, that the gates of Paradise are just broad enough to ad-

STARTING OF THE COACH FROM THE POSADA.

mit the cumbersome coach which is the object of his hourly worship.

How well I remember the preparation and starting from a way-side *posada* of the first *coche* I rode in!

This starting is an event, and illustrative of the country. The attendant circumstances of getting off in the morning were full of drollery. Though it seemed hardly fair for an American to laugh at the people that had so much to do with the discovery of his country, I could not help it. It may have been justifiable for their interference in our then rather confused international affairs. At any rate, I enjoyed the elaborate exordium of departure.

The harnessing was primitive—the various pieces of rope and leather were laid on the ground like a net, the animals dragged into it, and finally fastened within the mysterious tangle. The master then collected the heterogeneous reins; the *mozo* gathered a quantity of stones in his sash; the servants and assistants of the *venta*, where I had lodged overnight, appeared with sticks, and two or three old women, who are older and homelier in Spain than any where else, came out with their shrill voices, accompanied by a few lean dogs and thirsty loungers, resolved to assist on the occasion. The master shouted, swore, and shook the reins; the *mozo* shouted louder, swore deeper, and hurled a volley of stones—he is an animated catapult at such times; the attendants of the inn brandished their sticks, assaulted the beasts, and bellowed vociferously; the female antiques screamed in *altissimo*; while the loungers gesticulated and made grimaces that would have frightened any animal but a Spanish mule into mortal speed. This combined clamor and attack, this enforcement of material logic, finally resulted in the moving of the ponderous coach, which, as it groaned over the uneven highway, resembled a Dutch lugger on wheels. It did not seem that the crazy old vehicle could reach the end of the journey before its absolute dissolution; and I was as much surprised as any well-regulated mind allows itself to be in Spain, when I learned that, at the close of the day, it had accomplished twenty-five or thirty miles.

The hours were not misspent. I found entertainment in listening to the calling out of the driver to his obdurate beasts. They had sonorous and many-syllabled names, like *Balcattilla*, *Robidetto*, *Arthemayor*, and *Chippimenta*, and the last syllable was dwelt upon with a species of operatic quaver that would have elicited applause at the Theatre Real of Madrid.

The truest and purest representatives of Spain I found, of course, in New and Old Castile. Though the largest provinces in the country, embracing a third of its entirety, and containing some of the most ancient and national cities, they have, with a good deal of fine scenery, much of the dreariest and sterilest in the kingdom. The mountainous regions include numerous landscapes which render the plains

and table-lands (*parameras* and *tierras di campo*), without trees, hedges, inclosures, or landmarks, oppressively sad and monotonous. Those plains, like the Siberian steppes, give rest neither to the eye nor to the mind. Dryness is their pervading feature; and during the summer the soil is parched and scorched by the sun. In the Castiles, every object, animate and inanimate, is literally burned umber. The land, the huts which make up the scattered hamlets, the peasants, the mules, the stews even, and the scant verdure, are all brown—a color I ought to approve of for personal reasons, but which in excess may be objectionable artistically. When I first traveled through those spacious provinces, the apparent desolation, the mud-hovels or mud-huts, made of sun-dried bricks (*adobes*), the hard-featured, unwashed peasantry toiling in the dusty fields, so oppressed me that I repeated *Che seccatura!* again and again as mile after mile of the tawny and barren soil stretched and winked under the blazing sun. The poverty and destitution reminded me of the worst parts of southern Ireland, though in Ulster the land smiles with greenness, and the people are merry in the midst of misfortune. The Castilian peasants seem indolent as they lean upon their spades to watch the passing train or rumbling diligencia or the perspiring pedestrian—always an object of wonder, for no Spaniard can comprehend how any one should walk if he can help it; but they resume their labor when curiosity is satisfied, and work hard and faithfully and long. They are the least attractive to the stranger of all the provincialists in Spain; but they have good and sterling qualities, and are probably superior to any of the rest in integrity and character. They improve upon acquaintance; are patient, loyal, hospitable, and cheerful, with strong domestic tastes, and a keen sense of humor.

It is a striking instance of compensation that the people who are compelled to live in such a dreary region, and doomed to endless toil, are entirely contented, and would not exchange their squalid huts for the costliest abodes of Granada and Seville. It is their comfort and their pride that they are Castilians, which means that they have few equals and no superiors. They know nothing of other countries than Spain, and have no desires beyond it. They are in the world, but not of it. Their sphere is bounded by the few acres they cultivate, and their sympathies confined to the members of their family and their immediate neighbors. Their thoughts rise no higher than their awkward head-covering (*montera*), and their cloaks (*capas*) and over-coats (*anguarinas*) are the boundaries of their wishes. They have no glass in the rude apertures called windows; they live on chick peas (*cicers*); they bake in the summer and freeze in the winter; they hardly have water enough to drink in the dry season, and would never think of wasting it in washing. But as they are natives of Castile, where, by-the-by, the scap of that name is never seen,

FOUNTAIN OF CYBELE ON THE PRADO.

they are not unreasonable enough to expect such inferior and vulgar blessings as ease and abundance.

Seeing a stout and manly fellow laboring by the road-side one day I lifted my hat, knowing the sensitive dignity of the people, and bade him good-morning. He returned my salutation, and stopped his work for politeness sake.

"You have a hard life," I said.

"We keep ourselves busy; but we live, and are satisfied."

"And yet you have so little. You toil all day for coarse food and common lodging."

"But we live in Castile."

"Is that compensation for perpetual labor?"

"Oh yes; it is an honor to be born here, and a glory to till this ancient soil."

"Aren't you discontented sometimes?"

"Rarely; but when we are we pray to the Virgin, and remember it is vouchsafed to few to be Castilians."

"Couldn't you do better elsewhere than here?"

"Where should we go; are we not already in Castile? There is no other place for a true Spaniard."

"Wouldn't you like to have a fine olla, and rich wine, and long siestas every day?"

"Yes, if I could have them here."

"You wouldn't want to change your residence, then, for a better condition?"

"How could we be in better condition if we quitted Castile?"

I saw the lusty peasant could not imagine any good to exist out of his province, and begging him to accept a cigar, I rode on, and thanked Fortune that she had not cast my lot in that arid waste.

There is a native dignity about the Castilians that is very remarkable. Albeit narrow, ignorant, and extremely poor, they believe themselves favored of fate. Their manners are often better than those of the prosperous citizens of Madrid. They do not beg, nor borrow, nor make pretense, and so far they are gentlemen; and being gentlemen, they are right in fancying themselves without superiors.

Burgos is one of the first cities of interest I visited in Spain. I enjoyed its dullness and decay after the newness and gayety of Paris, and admired the Gothic cathedral and its spires of delicate open stone-work. They seemed so fragile that they might be blown away by the wind, which sweeps over the city as if it were bent on undoing the pious enterprise of Ferdinand *el santo*. Burgos teems with the dubious history

A STREET PEDDLER.

of Rodrigo Ruy Diaz, the redoubtable Cid whose marvelous deeds, as recorded, the Spaniards have fed their national vanity upon for generations. I was shown the castle in which the doughty champion was married, and the City Hall (*Casa del Ayuntamiento*) where his bones are preserved with the headless skeleton of his faithful spouse, Ximena. A most energetic gentleman Rodrigo must have been, not only in life, but after it, as is proved by the story—solemnly believed there—that his corpse, in complete armor, mounted on Babieca, knocked down a Jew at Cardena, who had the temerity to pluck the hero by the beard. Mrs. Cid, no doubt a domestic and quiet-loving lady, fearful of such

post-mortem pugnacity, proceeded straightway to put her liege lord underground; and so he was carried to Burgos, where he has, so far as known, behaved himself as a dead gentleman ought to.

Valladolid, the old capital, seemed a good place to visit, from the satisfaction I experienced in quitting it as soon as I had seen its unsightly and unfinished cathedral, its dreary streets, and its ruined buildings.

Once, in Madrid, I asked, what almost every body else asks: Why was the capital placed here? Philip II is responsible for the blunder; and the only reason he ever gave was, that Madrid is the geographical centre of Spain. I

have always fancied he was actuated by the malignity that so permeated his nature. He must have been gratified by reflecting how very uncomfortable his survivors would be in the sombre city, whose climate is described as nine months Greenland and three months Tophet.

Madrid is to me the least agreeable capital in Europe, and, with the exception of St. Petersburg, the dearest. It is the Washington of the Continent, which no one visits a second time unless called there by business or detained by destiny. The Spaniards are proud of Madrid because it is in Spain, and have told me with great unction that it is nearly two thousand years older than Rome. I am confident it was never heard of until the tenth century; but still I should think it might have been built before any other city, as a warning not to have another like it. It was rejected in turn by Iberian, Roman, Goth, and Moor, and might have been to-day an insignificant town but for the gout and phlegm of Charles V., who was benefited by its rarefied air. I have always ascribed to the location of the capital at Madrid, instead of Lisbon, the decline of the country, since it led to the revolt of Portugal and many subsequent ills. Various were the efforts to remove the capital from the windy basin on the Manzanares; but it could not be done. Nations, like individuals, are unable to resist their fate. I should send my friends to Paris and my foes to Madrid, where nothing but a vigorous constitution prevents men from being blown into the nearest cemetery. The delicious but pernicious breeze of the Roman Campagna is nothing to the air of the ancient Majoritum, which, as is truly said, will not put out a candle, but will extinguish life. Many strangers, broiling in the sun of the Plaza, have been delighted with the coolness the Guadarama sends them, until they discovered the undertakers were watching them with professional interest.

In my opinion there are but four months, April and May, October and November, favorable to a visit, though the Carnival time is the gayest, if not the most agreeable season.

The Madrilenians, like the Parisians, live in flats, and have staircases in common; but the doors to their apartments are thick and strong, and provided with wickets through which the servant or occupant surveys you before admission. I obtained an idea from such precautions that they consider themselves in a state of social siege, which is not very far from the truth; for every paterfamilias seems imbued with the idea that the external world is only waiting for an opportunity to carry off his wife and children, and that it behooves him, therefore, to be perpetually on his guard. Some of the interiors are desolate enough, and coming out of one in the *Calle de Toledo* with an American one day, after being fearfully bored, I suggested placing Dante's familiar *Lasciate*, etc., above the door.

"That would be classical," said my compan-

ion; "but it wouldn't be half as sensible as the vernacular over the wicket, 'You're not good-looking, and you can't come in.'"

I can't commend the hotels of the capital—on the whole, I think the boarding-houses (*casas de huéspedes*) are superior—but it is a very fair place for thirsty souls, and none in the wide world is thirstier than your Castilian. The common remark that they don't drink water on the Continent does not apply to the Spaniards, the dryness of the climate producing a like effect upon the inhabitants. I found one of the few good things in Madrid to be water, particularly that from the spring outside of the Puerta Segovia; although the city is not lacking in other palatable liquids. The Guadarama snows supply the place of ice, and the half-and-half (*mítj e mítj*), made of barley and pounded *chochos*, the clarified verjuice (*agraz*) mixed with Manzanilla wine, and the beer combined with lemon juice (*cerbeza con limon*), I thought very refreshing, and found my opinion momentarily confirmed by the natives. In all the public squares, promenades, cafés, restaurants, and theatres, drinks may be had at any moment. Wherever I walked or lounged men and boys were going about with matches for lighting cigars and cigarettes, and with vessels containing water, lemonade, wine, and mixed potables. The Spaniards smoke so constantly that they keep thirsty from morning to night, and really pass their days in alternations between fire and water, or something stronger. Emulsions are great favorites with them in sickness as well as health. The *leche de Almendras*, a sovereign remedy for various ills, is almost exactly the *αμυγδαλη φαρμακον αγαθον* of Athenæus, and is believed to be excellent from its age, which always begets reverence in Spain.

Beyond certain buildings and certain quarters, I was hardly repaid as a sight-seer for my exertions in the capital. Few of the streets are handsome or impressive, and nearly all of them have the gloominess and unchangeable aspect that spring from the superabundant bile of the nation. The Puerta del Sol (it is called the Gate of the Sun because it was once the eastern gate, on which the rising sun shone) is now a public square in the middle of the city, whence the principal thoroughfares radiate. The Puerta—Murat perpetrated the butchery of 1808 there—was formerly the resort of idlers, gossips, and news-mongers, and furnished opportunity for studying costumes. But modern progress has brought changes in dress and habits, and substituted for the place-hunter and adventurer the cicerone and mendicant. The former is not so desirous to be employed as he is in other countries; but the latter is among the most importunate of his tribe.

I have often heard that Spanish beggars are so sensitive that if alms are once refused they will not ask again. I should have been glad to find them so. But I have had a very different experience. Denial seems to sharpen their energy; and the only phrase reputed to have an

THE GYPSIES.

SPANISH BEGGARS.

exercising power, "Will you excuse me, my brother, for God's sake?" (*Perdone usted por Dios, Hermano?*), has had no more effect upon them than would appeals to justice upon New York hackmen. I once thought that the cheerful habit our imported beggars have of showing their ulcers and their wounds was born of our inventive atmosphere. But I have found it is a fashion borrowed from the Peninsula, as all who visit Spain will find likewise. The Puerta, the plazas generally, the Prado, and the Calle de Alcalá, swarm with the blind, the crippled, and the unfortunates of every sort. He or she who has a hideous scar or sore is sure to display

it, knowing, if your heart does not respond to the appeal for charity, that your sensibility will so revolt as to seek protection through the purse. Of course nearly every mendicant is professional, and many are impostors, though poverty is so common and employment so scarce in Castile that three-quarters of the Madrilenians might be pardoned for soliciting alms. Such ghastly spectacles of marring and maiming are unusual, even in Southern Europe; albeit I suspect not a few of them are artificially produced. I have seen miracles wrought in the secular walks of life that are almost as remarkable as, though far less numerous than, those recorded by the

Church. Sightless wretches who besieged me with prayers in the morning I have discovered scanning their reals with a critical eye in the afternoon; and one-armed and legless fellows sunning themselves in the Prado, would, under my mortal vision, be restored to soundness in the Buen Retiro Gardens.

The Plaza Mayor, where executions, autos da fé, and royal bull-fights once took place, is a large square, interesting now from what it has been. The buildings fronting the Plaza were leased formerly with the understanding that the balconies and front windows should be given up to the nobility when spectacles were presented. The quarter has been much injured by fires, which the priests at one time attempted to extinguish by displaying "the Host," but with such slender effect as to excite the suspicion that fire is an heretical element.

The Prado, the grand boulevard of the capital, two miles and a half long, is to Madrid what the Champs Elysées are to Paris. It was a meadow once, as the name indicates; but it is now entirely innocent of grass or verdure of any kind, except that supplied by the long lines of trees. Under them, on the iron chairs—two

quartos are charged for their use—sit the natives in the early morning. Spain rises betimes, and supplements sleep by the siesta, and particularly in the afternoon and evening, smoking, reading newspapers, chatting, and flirting in the grave manner that befits the Castilian. I can't admire the Prado; it is a hot and dusty place when it is not chilly and uncomfortable; but it is entertaining to open your mental note-book there, and jot down the peculiarities of surrounding men and women who carry on the soft war that has been waged so perpetually since the distinctions of physiology were first recognized. The eight fountains of the Prado are handsome, especially those of Neptune, Apollo, and Cybele; and their falling waters are most grateful music when heard under the burning sun.

The Buen Retiro and Botanical Gardens are neglected, and have fallen into decay; but the Campos Eliseos are well laid out, and much frequented by both sexes fond of music, dancing, feasting, and fire-works.

The reputation of the Royal Palace drew me to it. Like most things material and mental, it appears better at a distance than upon near approach. It is a vast building of white stone,

FOUNTAINS OF THE PRADO.

THE ROYAL ARMORY.

one hundred feet high and four hundred and seventy feet each way, marred by its square port-holes and its ungraceful chimney-pots. The statues that adorn it are poorly executed, and their disproportion often offends. The different saloons are richly frescoed, ornamented with marbles, heavily gilded; but fine taste is not observed where money has been lavished most. The windows overlook the river Manzanares, sometimes so dry in summer that the bed is actually sprinkled to lay the dust; but the view over the slopes, though they are leveled and terraced, is without the beauty and variety the Moors would have given it, had they had an opportunity to introduce their attractive if fantastic arts.

In the Royal Armory I saw as large a collection as there is in Europe—the armor and arms of all the actual and fabulous heroes and kings of Spain, including the Ferdinands, Philips, Charleses, the Cid, Pelayo, Bernardo del Capio, and almost every warrior of fame in ancient or modern times. Hannibal's, Augustus's, and Julius Cæsar's helmets are preserved; but their authenticity I questioned, because they betray evidence of having been made centuries after those disturbers of the public

peace had knocked at the door of Olympus and been admitted by Jupiter himself.

A singular institution for Madrid is the Magdalen Asylum, where I spent several hours. No woman is admitted unless indubitable evidence of her incontinence be given; and those admitted are never released, except to marry or become nuns. Connected with the asylum is a house of restraint, where women, wedded and single, are sent by their relatives and husbands who consider them too susceptible for security. There are no such houses as these outside of the Peninsula; but persons unblest with faith think they might be extended to other countries with advantage. It may be an argument, however, against the benefit of the establishments, that women placed there are said to be so indignant at the suspicion attaching to them that, when released, they endeavor to earn the meed of their accusation. Husbands who have occasion to be absent from home for any length of time not unfrequently put their wives under the protection of *Las Recojidas*, and take them out when they return. This custom is obsolescent, like the employment of bolts, bars, and duennas. Even the Spaniards have begun to perceive that femi-

nine honor must be guarded by moral, not material agencies, and that vulgar compulsion augments the tendency to sin by adding anger to temptation.

Before I ever set foot in Spain I knew what a gloomy and unsatisfactory pile the Escorial is. But being there it became my duty as a traveler to visit the monastic palace, lest those who had been before me should say, when I returned: "Not see the Escorial? Alas, my friend, you crossed the Pyrenees in vain!"

Twenty miles from the capital by rail, the desolate character of the country through which I passed was a proper prelude for the inspection of the great granite tomb which a bigoted and cruel monarch reared to his own vanity and superstition. When I saw the sombre edifice frowning in the distance above the savage outline of the Guadarama, I thought—How fitting it is to be the home and grave of Philip II.! The eighth wonder of the world, as it is called, seems like a huge family vault, and casts cold shadows even amidst the fierce sun-glare of Castile. Philip's ostensible object in its erection was, as we know, to execute the will of his father in constructing a royal burial-place, and also to fulfill a vow made to San Lorenzo at St. Quentin when the tide of battle had set against him. Lorenzo, according to theologic accounts, was broiled by Valentinianus over a slow fire, and to this circumstance we owe the Escorial's gridiron shape, in commemoration of the manner of the saintly martyrdom. My knowledge of history freshened as I wandered through the vast courts. I thought how the saturnine Philip went there after the battle of St. Quentin, for which, by-the-by, he was indebted to Philibert of Savoy, and lived fourteen years, the cowl over his crown, dying on the very day the palace was finished, in such remorse and agony as no one who has read the pages of Siguenza can fail to remember. When I recall the love Philip had for the Escorial, I can understand how gloomy must have been his temperament without looking into the library for the Titian portrait with its stony eyes and deathlike coldness of face. He loved the sacerdotal structure because he built it, because its dismalness sympathized with his, because he could boast that from its solitude he could, with a bit of paper, rule the world. A rectangular parallelogram, seven hundred feet long, and five hundred and sixty-four feet broad, composed of gray granite, with blue slates and leaden roofs, it reminds me, in spite of its size, simplicity, and situation, of a modern-day barracks or manufactory of gigantic proportions. Two thousand seven hundred feet above the sea-level, it is part of the mountain on which it stands, and seems a bulwark against the storms and snows of the Sieras, a species of Hospice of St. Bernard on a colossal scale. The architecture is mixed, but the Doric style prevails. The various courts represent the interstices of the gridiron, the royal residence the handle, and the four towers at each corner the legs of the implement re-

versed. The custodians are very voluble as to particulars. They told me it has eleven thousand windows (is the number so large because they are so small and out of proportion?), covers four hundred thousand square feet, has twelve cloisters, sixteen courts, eighty staircases, sixty-five fountains, and three thousand five hundred feet of painting in fresco. Until within the last twenty-five years it was allowed to decay. Since then it has been partially repaired, though it bears numerous weather-beaten traces on every side.

The palace and convent are now used for educational purposes, about three hundred students being instructed there for priestly and profane pursuits. The small chamber near the oratory is pointed out as the place where the crowned zealot breathed his last, and not far from the high altar the museum of superstition in which he collected thousands of relics of saints and martyrs. Never was there a greater bigot than Philip. In what he conceived to be sacred anatomy he was without an equal, as may be seen from the *relicario*. The presentation of a so-called martyr's toe or a saint's tooth gave him more pleasure than a victory; for he believed that either of those would go far toward the purchase of absolution for his blood-stained soul. After La Houssaye pillaged the Escorial he mixed up the relics in a manner that would have driven Philip to distraction if he had been alive; for since then it has been quite impossible to determine to whom the confused fragments of anatomy belong. I remember leaning in the *relicario* against what I supposed to be a fragment of stone; but discovered, from the horror I excited in the custodian, who crossed himself and uttered a confusion of prayers and invocations, that I had done something terrible. He explained to me that what I had taken for a stone was the thigh-bone of Saint Dominic or the thorax of Saint Ignatius—I am very deficient in knowledge of hagiography—and that it was one of the most cherished relics of Philip, as he phrased it, of blessed memory. He appeared to be as much shocked as astounded when I failed to be impressed with the enormity of my offense, muttered something about the total depravity of heretics, and perhaps secretly sighed for the restoration of the Inquisition.

Before I descended to the Pantheon—the royal tomb—I lighted a torch that was handed me, and with difficulty moved over the slippery marble steps. The great family vault is under the high altar, so that the priest who elevates the Host in the church may confer the benefit of the sacred act upon the dead below. Philip II., who really had taste in architecture, made the vault plain; but his son and grandson, on assuming the crown, rendered it tawdry with gilding and variegated marbles, and destroyed the impressive effect it originally had. The Pantheon is an octagon, about forty feet in diameter and about the same height, of dark marble and gilt bronze. On the eight sides

THE PANTHEON IN THE ESCORIAL.

are twenty-six black marble sarcophagi, exactly alike, perhaps to show the equality of death and the peership of sovereigns. On the right are the monarchs of the past, and on the left are their consorts—etiquette survives the grave in Spain—with the names of the deceased on each sarcophagus. Vacant niches yawn expectant for the future kings and queens, whose line was seriously interrupted by the revolution. The urn Isabella would have occupied was shown to me. If she had sought to assert her right it would now be filled, I opine; and it is quite possible she would prefer quiet burial some years hence in Montmartre or Père la Chaise to the earlier honors of sepulture there.

At the first break (*descanso*) in the staircase I was conducted into another burial-place, where more members of the royal family—Isabella of Valois, Don Juan of Austria, and Don Carlos among them—sleep their dreamless sleep. Every body who has read Schiller's tragedy sympathizes with the unfortunate son of Philip, and is inclined to believe the poetic is the historic account. But all the educated persons in Madrid with whom I conversed on the subject declare that the prince's hatred of his father, who ordered his arrest in 1568, arose from fits of temper, caused by a fall from his horse six years before, which impaired both his mind and body. They referred me to Raumur for proof that he never loved his step-mother, and that both he and she died natural deaths.

In the cloisters and court-yards—unpleasant and the walls badly painted—I saw nothing to detain me, and I was glad to hurry to the handle of the gridiron (*el mango de la parrilla*), which is, as I have said, the royal residence. The rooms of state are poorly furnished, and so uninviting that I do not wonder the monarchs, after spending a few weeks there, hastened to the fair but artificial gardens of San Ildefonso. The kings, queens, and courtiers were always accessible to the monks, and practiced outward austerities, while their private lives were licentious and shameless. They were theologic epicures, sinning for the pleasure of confessing, and breaking the Commandments for the honor of absolution. The rooms Don Carlos occupied awoke new pity for him; but the indignation I felt against his father was softened when I stood in the humble apartment where Philip was carried, in his mental and physical agony, that he might gaze upon the altar he had dishonored, and profane with bigot lips the crucifix Charles V. had kissed with expiring breath.

With all the shadows and suggestions of the Escorial around me, I thought, This is indeed like Spain. So proud in feeling, so poor in performance; so fearful of innovations, so overborne by the ancient; she stands among nations as this monkish palace, in the midst of sun-glare and desolation, a dark memory of the past and an awful warning for the future.

THE MYSTERIES OF A THUNDER-SHOWER.

THE ELECTRIC SPARK.

ON a summer's morning, when the barometer has been high and the sun has been warm for several successive days, we sometimes find, at ten o'clock, that not a cloud is to be seen,

nor the least trace of any mist or haze in any part of the sky.

And yet the atmosphere at such a time as this is perhaps more than usually loaded with water!

One indication of the fact that the atmosphere is at such a time more than usually loaded with water is, that the ground is more than usually dry. A very large part of the moisture which the soil ordinarily contains has been constantly ascending—during the warm days, or weeks perhaps, that have passed—into the air. The same process has also been going on from all the surfaces of water. The ponds and rivers and brooks are all low. A large portion of their natural and ordinary supply of water has been volatilized by the warmth of the sun, and now floats in the air in the form of an invisible vapor.

And yet, though the atmosphere contains an unusually large supply of watery particles at such a time, we call it dry. And we do right to call it so, though perhaps, strictly speaking, it would be more proper to call it *drying*. The dampness or dryness of an atmosphere, in its effects upon animal or vegetable substances exposed to it, does not depend upon the absolute quantity of water which it holds in solution so much as upon its disposition to give up what it has, or, on the other hand, to retain it and absorb more. If the atmosphere has but little water in suspension in it, but is in a condition to deliver up and deposit what it has upon an object exposed to it, we call it a wet atmosphere. The day when such a state of things exists we call a wet day, though perhaps it would be more strictly accurate to say a *wetting* day. At any rate, that is what we mean.

A ribbon, which, like other such fabrics, in its ordinary state of exposure to atmospheric influences, is never wholly free from water—or, in other words, which is never *perfectly dry*,* and can not be made so without great difficulty, and only by a very nice and careful chemical process—waved in such an atmosphere, imbibes more water than it had before, and perhaps receives enough to make it feel sensibly damp to the touch.

On the other hand, if the atmosphere has a great quantity of water in suspension, but still is in such a condition that, instead of being inclined to surrender what it has, it thirsts, so to speak, for more, then we call it a dry atmosphere; not meaning, however, strictly speaking, that it is dry in itself, but drying in its effects upon bodies exposed to it.

* That is to say, it is never perfectly dry, if we mean by that *perfectly free from water*. In common parlance we call any substance dry when it contains so little water that it does not communicate what it has to any other substance brought into contact with it. It is perfectly proper to use the word in this sense, provided we understand that it does not denote *absolute destitution of water*.

A ribbon waved in such an atmosphere as this will be found, by the application of nice tests, to have less moisture in its texture than before. The air, though heavily charged with aqueous vapor, is still unsatisfied, and demands more. To supply this want it takes up water wherever it can find it, and thus dries, or tends to dry, all moist bodies. We accordingly call it a dry, meaning a drying, atmosphere.

An instrument contrived to indicate the degree of moisture contained in the atmosphere is called an hygrometer. There are different instruments of this character, which act on very different principles. Perhaps the most simple are those in which a slender cord, or even a single filament of some animal or vegetable substance, is employed to denote, by its contractions and elongations, the degree of moisture which acts upon it. The hygrometer of Saussure (Fig. 1) shows this instrument in its most simple form. The filament, consisting usually of a hair properly prepared, being fixed at one end, and passing round a pulley at the other, moves the index as it shrinks or expands, according to the hygrometrical condition of the atmosphere around it.

Fig. 2 is an instrument acting on the same principle, but in an improved form. The filament is lengthened by means of the pulleys, so as to make the movements of the needle more sensible; and the whole is so arranged as to be put into a case of the form of a watch, to be carried in the pocket. The spiral spring seen below acts to hold the needle at the point indicated by keeping the filament at all times in a state of gentle tension.

A hygrometrical instrument often takes the form of a toy, as in Fig. 3, where the cowl of the monk serves as the index, by being drawn up over his head or allowed to fall back, according to the state of the atmosphere, as indicated by the expansions and contractions of a hygrometrical filament concealed in the figure. Such toys are made in a great variety of forms, although it is almost

always the figure of a monk that appears in them. The monk is chosen, it is to be presumed, not out of any disrespect to his holy vocation, but simply on account of the convenience of his peculiar head-dress for the movement necessary. Perhaps, however, there are some forms of a lady's hood which might answer equally well.

But to return to the weather.

On such a summer's day as that to which we were referring, the capacity of the air for absorbing aqueous vapor is very high. The chief condition of this high capacity is warmth—warm air having the power of taking up water much more rapidly, and holding a much larger quantity in solution or suspension, than cold. In consequence of this increased capacity, water has been rising into it in vast quantities—from the ground, from the surfaces of ponds and streams, and from every other source of supply. Still it is not satisfied; or, to speak without a metaphor, it is not *saturated*. It demands more. If there should be a mist or a cloud any where in the sky, it dissolves it at once. It drinks it, as it were, to quench its thirst.

So, too, if water is sprinkled upon the ground at such a time, or upon a board, or upon a rock, the atmosphere drinks it with great avidity. Loaded though it be already with moisture, it still thirsts for more, and eagerly seizes upon all that comes within its reach.

This state of things continues usually, on such a day as we have supposed, and in such a climate as that of the United States, until about noon, and then a phenomenon takes place which is of a most mysterious and indeed inexplicable character, and one which, were we not so familiar with it, would excite our wonder and astonishment in the highest degree—namely, the formation, usually in the *western* sky, of large, rounded, and perfectly well defined clouds. The wonder is twofold. First, why the clouds should be formed at all; and secondly, why they should be marked by such distinct, sharp, and well-defined boundaries.

Fig. 1.—HYGROMETER OF SAUSSURE.

Fig. 2.—HYGROMETER OF MONNIER.

Fig. 3.—THE MONK.

First, why should such clouds be formed at all? We can easily imagine that the atmosphere might, after taking up great quantities of moisture in a warm day, or in a succession of warm days, undergo some gradual change, such as becoming more cold, or more dense, or more rare, or in other respects different in condition from what it was before, and so be inclined to give up its water. But we should have expected that this change would be gradual—that we should see at first only a faint general haze, which would slowly increase as the change in the condition of the air producing it went on. Such a general change in the condition of the atmosphere, and such a wide-spread tendency to precipitate moisture, does actually take place sometimes, producing the appearances which we observe when we say there is a storm gathering.

We can also understand how, when the air near the earth has been warmed by the sun, and has become loaded with moisture, as in the case we have supposed, there might be a cold stratum above, which, by some change in the currents of the upper air, might be caused to pass over it and to *dip into it*, as it were, and chill a portion of the warm air along the line, or rather *surface*, of junction, and so cause it to deposit its moisture. This would produce thin strata of smooth, or sometimes more or less feathery, clouds, known to the meteorologists as *strati* and *cirri*, such as we often see in a summer's day spread over the whole expanse of the sky.

But what the influence or agency can be to cause the atmosphere to change its condition so suddenly in the middle of the day, at the time when the rays of the sun are most powerful, so that, from manifesting an abundant capacity for taking up and holding perfectly in solution all the water within its reach, it suddenly begins to give it up with the utmost rapidity and profuseness, is one branch of the mystery which the phenomena of a thunder-shower involve.

A cloud is nothing else than an assemblage of small globules or vesicles of water. When the globules are very small, so that they float in the atmosphere, they form simply a cloud. When they increase in size, so that their weight

CIRRI.

causes them to fall to the earth, they become rain. The nature of the globules, however, is the same in both cases, and the manner in which they are formed is the same.

Thus the air, which during the whole of the forenoon of a hot summer's day seems to have an insatiable thirst for water, so as to drink up and hold in an invisible form all that it can obtain, suddenly, at or about noon, changes its condition within certain well-defined limits, and begins to release its hold upon it. The particles then becoming liquid water once more, join together, and, by their mutual attraction, arrange themselves into globules, which float in the air, forming mists or clouds, until they become large enough to descend to the earth as rain.

What can be the reason of this change? If it took place at night, after the sun had gone down, we should not have been surprised. We should have inferred that the withdrawal of the beams of the sun, by cooling the air, diminished its capacity for water, and caused it to surrender a part of its charge. But why should such a condensation take place during the day? And in the middle of the day, too, just as the beams of the sun have become most intense, and their influence on the atmosphere, and on the capacity of the atmosphere for water, are most powerful?

But, secondly, suppose a cause to be discovered why thus, in the middle of a hot day, and under a meridian sun, the air should all at once change its condition, and begin so rapidly to surrender the water which a few hours before it had evinced so great an eagerness to absorb, there remains another and a still greater mystery, namely, Why the tendency to condensation should manifest itself only in certain circumscribed spaces in the atmosphere, within which the precipitation of the moisture should go on with such rapidity as to form a dense and opaque mass, sometimes almost wholly impervious to the rays of the sun, while immediately without them—the boundary being distinct, sharp, and exceedingly well defined—the atmosphere should remain as clear and pellucid as ever. If we look at the outline of one of these rounded summer clouds, we shall see that nothing could be

STRATI.

STREATI AND CIRRI AMONG THE MOUNTAINS.

more sharply defined. The condensation seems to take effect fully and in all its force quite up to the line. Beyond the line, and at the very instant that it is passed, the phenomenon ceases suddenly and entirely. There is here no condensation at all. The air continues as clear and transparent as ever.

Indeed, the landscape painter finds no form in nature that he has to delineate with an outline more sharp and clear than that of a summer cloud of this character; and so well defined are the surfaces which bound the area of condensation that they will actually reflect sound, producing echoes and reverberations, like a precipice of rocks or a solid wall.

These surfaces always assume rounded forms. Now, whenever in nature we find any phenomenon develop rounded or spherical forms, there is usually indicated a cause or agency bearing some relation to a centre. It is attraction *toward* a centre, or radiation *from* a centre, or some other influence or action analogous to these. Thus, in the present case, it would seem that there were centres in the atmosphere, in which at such a time a tendency to condensation is developed by some mysterious means, and that the condensation thus commenced spreads uniformly in all directions, proceeding, however, in such a manner as to preserve a distinct and well-defined boundary between the space to which the condensation extends and that beyond. Sometimes this process goes on for a time, and then the action is reversed. The atmosphere seems to recover again its disposition to absorb instead of giving up moisture, and the cloud grows gradually smaller, and finally fades away and disappears. In other cases the process proceeds with increasing energy. The surrendering of water by the air goes

on with such rapidity that great drops are formed by millions, which descend to the earth in a shower so copious as sometimes to deluge the whole country over which the cloud is formed.

And yet an hour, perhaps, before that same air on that same day, and under that same sun, was almost as eager to take up from the earth that same water, or its equivalent, as it is now to throw it down.

Whenever, in the study of nature, we encounter a phenomenon which seems inexplicable, so that, after looking into it and around it with the closest scrutiny that we can exercise, we can find no means of explaining it, we always experience a certain relief in our perplexity if we can find some other difficulty which seems analogous to it. Next to finding the solution of

a mystery, it would seem that we are most pleased with finding a duplicate of it. Two analogous difficulties are less perplexing to us than one standing alone, which fact, though it may seem paradoxical, is not at all surprising; for in finding the second example of the mystery we always imagine that we have taken an important step toward discovering the secret of the first.

We have the advantage of this relief in the present case; for we find, when we watch the conditions under which water in freezing changes from a liquid to a solid form, on the surface of a lake or river, or in a vessel upon the table, that a phenomenon presents itself which is strikingly similar to that which we have observed to take place in the air while it was changing from a gaseous to a liquid form.

Observe what takes place upon the surface of a sheet of water when it commences to freeze. The air above it grows colder and colder until it gets below the freezing-point. It is equally cold at every portion of the surface of the water, and we might have expected that the water would begin to freeze at the same time and in the same manner at every part. But it is not

CUMULI.

so. It begins to freeze at the edges or around the little leaves or sticks that may be floating on the surface, and from these points crystals shoot in various directions among the liquid particles, the sides and terminations of the crystals being limited by distinct and perfectly well defined lines separating the ice from the liquid water around it, just as the clouds had been circumscribed by definite limits and bounds dividing them from the transparent air around them.

Why does not the water begin to solidify at once universally all over the surface of the lake, so as to produce a general thickening of the water, with minute particles of ice, formed in every part like a cloudy precipitate in a chemical solution? The solidification never does take place in this general manner. There is a part where the water is frozen into a solid mass, and a part beyond where it remains entirely liquid. The former gradually spreads and extends over the latter; but during the process the line of demarkation between what is liquid and what is solid remains perfectly distinct and well defined, so much so that when at last the shooting crystals converging from the circumference toward the centre are ready to meet there, having solidified in their progress almost the whole surface of the sheet, the little space which still remains to be closed retains its water to the very last moment in the same condition of perfect fluidity as at first.

Thus there seems a strong analogy between the manner in which liquid water becomes solid by freezing in a bowl, and that in which gaseous water becomes liquid by condensation in the summer sky, in this respect—namely, that in both cases the process goes on, not by a diffused and general action pervading the whole mass, but by a sort of radiation proceeding from centres, in the progress of which a distinct line of demarkation is kept up from the beginning to the end, between what is brought into the new condition, whether liquid or solid, and that which yet remains in the old.

There is one striking difference between the visible results in the two cases, and that is that in the process of congelation from the liquid state the particles of water join each other in such a manner as to produce long pointed crystals, bounded by straight lines and sharp angles; whereas in condensation from the air they group themselves in masses which assume rounded forms, like the convolutions of smoke. But this difference depends, no doubt, on the fact that in the latter case the condensed masses being fluid themselves, and floating freely in a fluid atmosphere, are free to take any form which the various attractions and other forces to which they are exposed tend to impart to them; while in the former the particles are held by the solidity which is the special characteristic of their new state in the precise positions which they first assumed in the act of entering it.

THE NIMBUS.

The philosophy of these processes is by no means yet fully understood; but it is well known that the singular effects connected with them are due, in a very considerable degree, to the action of a very mysterious and hidden cause which we call electricity. There is abundant and direct proof that the agency of electricity is concerned in the process of crystallization in all cases; and there is still more striking and impressive proof of its presence, and of its exercising a most energetic action, in the formation of summer clouds. The mode of action may, however, be extremely different in the two cases. There certainly is a very great difference in the manner in which this mysterious agent manifests its presence and power to human observation in the one and in the other.

Electricity is the name we give to the unknown cause of certain very curious and remarkable effects which we see produced in nature. We know nothing whatever in relation to this cause, except the effects which it produces. The imagination is continually struggling to look beyond these effects, and to form some conception of a material substance which may exist, in fact, independently of them, and which, by its movements, or in some other way, may produce them. But this is vain. We know nothing, and can know nothing, but the effects. The effects properly grouped and classified form what we call the science of electricity. But the effects themselves are all that, strictly speaking, can be the objects of our knowledge.

It is necessary to understand thus where the limit lies in respect to the knowledge which we may hope to acquire of natural phenomena, in order that we may not be misled by the phraseology which, on account of the poverty of language, it is necessary for us to use—or at least extremely convenient to use—in describing the phenomena. We speak of electricity as moving from place to place—of its striking—of its being diffused over a surface, or concentrated in a point. We designate it as a fluid. Indeed, it has been extensively believed to be really a fluid—one of very great tenuity and elastic force. But whether the phenomena which we witness really result from the presence and progressive motions of such a fluid, or from the vibrations or undulations propagated

DEVELOPMENT OF ELECTRICITY THROUGH THE CONDENSATION OF STEAM.

through other material media, or whether they are produced in some other mode wholly beyond the experience of man, and, by consequence, entirely incomprehensible to him, is not known. All that we know is that there is a peculiar energy, universally diffused through nature, existing sometimes in a dormant state and sometimes in a condition of the most intense and energetic action. For convenience of language we speak of it as a substance, and represent it as moving from place to place. But all that is to be understood by this is that an energy exists, and is transmitted, without at all pretending to know precisely under what form or in what way.

It is found that the condensation of water in the summer sky, such as we have described, is always attended by a great development of this unseen and mysterious energy—be it fluid, vi-

bration, force, or whatever else we choose to call it. The more rapid the condensation the more copiously is the electricity developed. Which is the cause and which is the effect, it is impossible to say; but the two phenomena accompany each other in a very remarkable manner.

This connection between the development of electricity and the condensation of aqueous vapor, which was for a long time known only to exist in the case of the thunder-cloud, has since been found to be universal. The attention of scientific men was called strongly to this subject by an incident which occurred to an engineer in charge of a locomotive near Newcastle, in England, in 1840. This engineer happened to pass one hand very near the cloud of vapor which was issuing from the escape-pipe of his engine, at the instant when the other was

in contact with a metallic handle attached to some part of the machinery. The combination happened to be such as to make his body part of an electric circuit, and he experienced a sudden and quite powerful shock.

This incident led to a more thorough study of the electrical phenomena connected with the condensation of water, and it was found that electricity could be excited in any quantity by this means. The engraving represents a machine or engine constructed by Armstrong for this purpose. It consists of a boiler mounted upon insulating columns, provided, as usual, with fire-box, water-gauge, safety-valve, and smoke-pipe, and also furnished with an apparatus by which jets of the steam may be thrown upon a system of metallic points connected with an insulated conductor. The operation of such a machine as this is very powerful, though, for obvious reasons, it is not a convenient one for practical use.

In the case of the condensation of vapor in the atmosphere, so long as the cloud remains small, the presence of the electricity does not manifest itself by any outward sign; but when it becomes large and very dense, and especially when it is rapidly formed, the electric energy becomes excessive, and it produces two effects strikingly manifest to the senses—a brilliant chain of forked and glittering light dazzling the eye, and a series of tremendous detonations and reverberations overpowering the ear. The direction of the line of light is often toward the earth, and by the very remarkable effects which are produced at the termination of it we know that in some way or other a force of very extraordinary intensity has been transmitted from the cloud to the ground.

The discharges, as we term them, take place sometimes in very quick succession, showing that the electric energy is very abundantly developed, and in such cases the condensation of water goes on in an equally extraordinary manner.

This state of things continues for several hours. The two effects—namely, the development of electricity and the condensation of water—go on together, the one keeping pace, to all appearance, exactly with the other. The electricity, as it is developed, discharges itself in glittering lines of light darting through the air. The water descends, by its gravitation, to the earth in a deluging shower. During all this time the cloud moves slowly on from west to east, increasing all the while in density and extent, until the heavens are black with it, and the earth for a region of many miles is thrown into deep shadow.

ARMSTRONG'S MACHINE.

At length the energy of this double action, that of the development of electricity and the condensation and precipitation of water, seems to reach and pass its maximum, and then gradually to subside. The descent of the water becomes less copious. The flashes and detonations produced by the electricity become more rare. Finally they cease altogether. The rain-drops cease to fall. The air, from having been so ready to give up the moisture which it had held in solution, resumes its former tendency to absorb it. The remaining globules which continue floating in the cloud are dissolved. The cloud itself is thus gradually diminished, and finally disappears; and the portion of the atmosphere which it occupied, though perhaps that portion has in the interval been made to traverse a considerable extent of country, becomes as transparent and pellucid as before, while perhaps at a few miles' distance the same process is just commencing anew, from some new centre—to go through the same course of developing electricity, and condensing water in the most rapid and energetic manner within a certain circumscribed and well-defined space, for a certain limited time; and then at length, after exhausting its energy, restoring every thing again to its pristine serenity and repose.

The eye is subject to a singular illusion in watching the progress of the thunder-clouds which are formed in the west in a summer's

EFFECTS OF THE DISCHARGE.

day. They seem to be formed low in the horizon, and to *rise* as they come on. But this apparent lowness of position and subsequent rising is all an illusion, the clouds being actually at the same height above the surface of the earth all the time.

This is shown to be true by several considerations. In the first place, if the apparent rising of the clouds were a real rising, then they must have been formed near the ground at the place from which the observer at any point sees them appear to rise; in which case the people living at that place—which can only be usually at a distance of eight or ten miles from the station of the observer—would see them *forming* all around them, at or near the surface of the earth, as fogs sometimes form on low grounds in autumn mornings. But this is never the case. The thunder-clouds produced on a sultry summer afternoon never, to any observer, seem near the ground, except when they are at a distance from where he stands.

Thus, when thunder-clouds are formed over

any great extent of country—the State of New York, for instance—the people of Albany, of Utica, of Rochester, and of Buffalo all see them high in the air. The people of Albany, it is true, looking west, in the direction of Utica, see the clouds close to the horizon, and they might imagine that at Utica they were really lying near the ground. But the people of Utica see them high in the air. They, in their turn, looking still farther west, toward Rochester, see another group of clouds near the horizon, which they too, in turn, might suppose to be in fact close to the ground. Thus it is along the whole line. Each set of observers sees that their own clouds are high, and might easily imagine, under the influence of an optical illusion, that those which lie at a distance from them are low.

Nor is this illusion confined to the case of clouds. The top of the mast of a ship two hundred feet above the water, seen at a certain distance from the observer, just peeps above the horizon, and at a little greater distance it sinks below it altogether. If it were a thousand feet high, it would only be necessary to remove it to a greater distance to bring it down as close to the horizon as before.

If, now, there were a ball of fire placed upon the top of

such a mast, and then if in the night the ship were to advance rapidly from its distant position toward the station of the observer, the ball would seem to rise in the sky, growing larger and larger also as it approached, precisely like the electric clouds, while yet, in fact, it would remain at the same distance above the surface of the water all the time.

The apparent rising of the cloud, therefore, and also a great portion of its apparent increase in size, are optical illusions.

In the same manner, a bird or flock of birds, flying toward us at a great altitude, appear to be at a comparatively low elevation when they first come into view, and to rise as they approach—while really they are traversing the country at the same level.

The same principle applies to fixed as well as moving points in the sky, making those that are near us appear high, and those that are more remote lower. This produces the arched appearance of the heavens, almost the whole of which is due to this optical illusion.

We say *almost* the whole of it, for a level stratum, as of clouds for example, spread over the sky at a certain distance from the earth, would have a *slight* curvature—that is, a curvature corresponding to that of the surface of the globe; but this curvature is too small to have any sensible effect in producing the appearance of a dome. The dome-like aspect which the sky presents is thus a grand optical illusion.

The light and heat which are so strikingly manifested sometimes in electric discharges from the clouds are not properties, directly, of the electricity itself, but effects developed by it in other substances. While the electricity remains quiescent in the cloud, the darkness and coldness of the cloud are not at all diminished by its presence. It is only when it is transmitted through the air, or through some other resisting medium, that light and heat appear. They are not inherent in the electricity itself, but are produced in some way by the disruption of the resisting substances through which it passes. Just as the flint and steel, cold in themselves, develop an intense heat by the friction produced when they are brought into collision.

This truth, that the heat and light which accompanies an electric discharge from the clouds are affections, not of the electrical energy itself, but of other substances on which this energy acts in passing through or over them, is abundantly confirmed by experiments which are made with electricity artificially excited. So long as a quantity of electricity remains in a quiescent state on the surface of a conductor or of a Leyden-jar, no matter how great the quantity may be, or how highly concentrated, it produces no warmth in the substance retaining it, nor does it cause it to emit any light. But when this same supply, thus accumulated, is made to pass through the air, it emits an intense light, and produces a degree of heat sufficient to fuse metals:

The electricity of the cloud, then, after being gradually accumulated in connection with the process of condensation, at last transmits itself through the air, either to the earth or to some other cloud; and in so doing, either by the force of friction or disruption, or by some other means to us unknown, produces an intense degree of light and heat. The light, especially at night, illumines the whole heavens, and the heat inflames or fuses almost every thing that comes in its way.

The track of the electricity through the air, in the case of a discharge from the clouds, is not usually straight; but its course, as it appears to the eye, is a zigzag, with many sharp, angular turns, and sometimes irregularly radiating branches. The duration of the light is very short, even upon the retina of the eye, but it is very much shorter in *reality*; for the eye retains an impression of light for a sensible period after the external light which produced it has disappeared. We see this in the well-known experiment of whirling a lighted stick

ELECTRIC RAMIFICATIONS.

in the air, which produces upon the eye the impression of a continued circle of fire, while the real light is only a point, and not any circle at all. It is made a circle on the retina by that organ's retaining the impression which the point makes in any given part of the circuit, until the said point, in revolving, returns to that part again.

The flash, then, in the case of an electrical discharge, is very much more nearly instantaneous, in fact, than it appears to the eye. And, strange as it may seem, the actual duration of it has been measured. The result of this measurement shows that to say that the light emitted by the spark is gone in a second, or a half of a second, or a tenth of a second, is enormously to exaggerate its duration. To say that it endures for the millionth part of a second is to multiply the actual length of the period a *thousand* times; that is to say, the light has been proved to be so exceedingly brief in its duration, that there might be five hundred repetitions of it, with an equal interval of total darkness after every flash, in the *millionth part* of a second!

The first effect, undoubtedly, which will be produced on the minds of most readers in receiving such a statement as this will be the conviction that all pretensions to having computed, and still more to having measured, such portions of duration as this must be futile, and the results wholly fanciful and imaginary. But the very nice calculations of mathematicians and philosophers—calculations which would at first view seem as extraordinary as this—have been abundantly verified in so many instances, as for example in the motions and disturbing forces of the heavenly bodies, as to entitle those who make them to claim from mankind at large some degree of confidence in the results which they announce to us, in cases where we have not the opportunity to verify them.

In this case, however, although few persons have the means at hand of verifying the calculation, the principle on which it is made can be rendered so far intelligible as to show that it is *possible* to measure accurately an endless series of periods of duration that are all, in respect to minuteness, infinitely beyond the cognizance of our senses; thus doing, in respect to time, what the microscope enables us to do in respect to extension.

It would be somewhat difficult to describe fully the apparatus used, and the method of using it for accomplishing this result; but a general idea of the principle on which it operates can be very easily communicated.

Imagine, then, that the hands of a common clock are removed, and that the works within are connected with the *face* of the clock, so as to cause the face itself to revolve with a moderate rapidity—for example, at the rate of one revolution in each minute.

Suppose, now, that a sheet of paper is pasted upon the glass of the clock-case, so as to hide the revolving dial or face entirely from view, excepting at one small round spot near the top, where a hole had been cut in the paper before it was put upon the glass. We will suppose that the hole is in such a position as that the character XII. should be seen through it when the dial is in its natural position. If, now, a person standing before the clock looks through the hole in the paper, and the clock face begins to revolve, moving backward, that is from right to left, he will see the numbers pass in succession, behind the opening, in the order I., II., III., and so on.

If, now, the observer remains in his position, with his eyes open for *one minute*, he will see the whole series of the hours come into view. If he keeps his eyes open only for a quarter of a minute, he will see only a quarter of the series. And so, conversely, it would be easy by this contrivance to ascertain how long he kept his eyes open in any particular instance, from knowing how large a part of the series he saw. If he were to say, I opened my eyes just as the XII. was leaving the field of view, and shut them again just as the II. was coming into it, we might say, then you must have kept them open for one-sixth part of a minute; for the dial makes one revolution a minute, and it was one-sixth part of the circumference that you saw.

It is obvious that the principle would be the same if the dial were to revolve *once in a second*; for then it would be for the sixth part of a second that the observer's eyes would have been open, if he saw the spaces extending from XII. to II. The *principle* would be the same; but it would be impossible to operate at this speed with the human eye, on account of its not being quick enough in receiving and giving up the light which strikes the retina, and in transmitting the impressions to the mind. It is plain, however, that if the eye *were* quick and sensitive enough, the *method* would be equally

applicable to a revolution of once in a second, or a hundred times in a second, or at any other rate whatever. If the observer saw all the hours from XII. to VI. while the dial was revolving at the rate of a thousand times in a second, which is, of course, at the rate of one revolution in the thousandth part of a second, we should know that his eyes were open for just one-half that period of time; and so with any other portion of the circumference of the dial which might come into view.

Now although the sensitiveness of the human eye is not quick enough for such an operation, we have an agency at our command that is. There is a photographic arrangement by means of which an impression from light may be taken in an inconceivably short space of time. So quick is it, indeed, that a cannon-ball, at the instant of its leaving the mouth of the cannon, when it is wholly invisible to the human eye, will leave a distinct image of itself upon the photographic surface as it passes by an opening in a screen opposite to which the photographic instrument is placed.

Now imagine that instead of the living observer the photographic apparatus above referred to is placed before the clock. The room is dark. An arrangement is made for producing an electric spark at such a point in front of the clock as that the light from it shall shine through the opening in the paper, and illuminate such a portion of the dial-plate behind as *shall be in the act of passing during the continuance of the light*.

The arrangements being all thus made, and the dial-plate being set in extremely rapid motion, the electric discharge is at length made. The light from it shines through the opening and illuminates the passing portion of the disk. The portion so illuminated impresses its image indelibly upon the photographic screen, which, being made to move rapidly in a contrary direction, receives the different portions of the impression upon different portions of its surface; and thus, after the experiment is concluded, shows precisely how long the illumination of the spark continued.

It will be of course understood that in the above explanation no attempt is made to describe precisely the exact form of the apparatus used, but only to illustrate the principle on which it operates, with a view of showing the reader that the idea of making such extremely minute measurements of time as have been referred to is perfectly practicable, instead of being wholly absurd, as it might at first appear.

Although the light produced by the electric spark, even in its effect upon the eye, is so nearly instantaneous in its duration, the sound, in the case of discharges from the clouds in the sky, is greatly prolonged. The sound commences, when the discharge is near, with a series of terrific detonations following each other in quick succession, and is followed by long, rolling reverberations and echoes which are continued for a considerable time. This

LIGHTNING STRIKING A TREE.

prolongation of a sound, which is produced by one single and instantaneous impulse, is due to two causes.

The first cause is the difference of the time which is required for the sounds produced in different parts of the track of the electric discharge to come in to the ear. Sounds may take place, in fact, at the same absolute moment of time, and yet come home *in succession* to the ear of any listener. They must do so, in fact, if they take place at different distances from the ear; and the intervals between them, as heard, will depend upon these relative distances.

For example, let us suppose that four cannons are placed in a row upon a plain, at distances of a mile from each other, and that an observer is stationed in the same line, but at the distance of one mile from the end of the row. Suppose, now, that by means of a given signal, or by a galvanic wire passing along the line, all four of the cannons are discharged at the same instant of time, the observer would by no means, in such a case, hear them together. There would be a distinct interval between the several sounds as they reached his ear, on account of the fact that the sound of the first would have to pass through a distance of only one mile, while the second would have a journey to make of two miles, the third of three, and the fourth of four. Now, as sound travels at the rate of a little more than a thousand feet in a second, which is not far from a mile in five seconds, the observer would hear the reports at intervals of about five seconds each; and a period of twenty seconds would elapse before all the sounds would come in.

To apply this reasoning to the case of an

electric discharge from the clouds, let us suppose that an observer stands to the eastward of a cloud, and at the distance of a mile from it, and that the electric discharge passes from one cloud to another, the latter being situated a mile to the westward of the former. Now, although the discharge should actually pass across this interval in an instant, and the sounds which it would produce would be actually simultaneous in all parts of the line, or at least so nearly simultaneous that there would be no appreciable difference, in actual fact, between the beginning and the end of it, still, as in the case of the simultaneous sounds produced by the reports of the line of cannons, the different portions of it would come *in succession* to the ear. Five seconds would elapse after the flash before the beginning of the clap of thunder would be heard, and then five seconds more would be required to bring the whole *length* of the sound, so to speak, fully in, and that without making any account whatever of echoes and reverberations.

This fact, that sound moves through the air in a summer's day at about the rate of a mile in five seconds, gives us a very convenient and sufficiently accurate mode of measuring the distance from us of any electric discharge from the clouds which we witness, by counting the number of seconds that intervene between the flash and the commencement of the sound of the thunder, and then reckoning a mile of distance for every five of the number of seconds so ascertained. The seconds may be observed by means of a watch or clock, or otherwise, accurately enough, by beating seconds with the hand, or slow counting. When a thunder-cloud is coming on, it will be found that the

THE COAST GUARD.

interval between the flash and the sound diminishes as the cloud draws near, and then increases again after it has passed by.

The second cause by which the sound of thunder, which in reality consists only of one single and instantaneous explosion, is so prolonged is found in the echoes and reverberations produced by reflections of the sound, from forests, precipices of rocks, faces of mountains, and, more than all the rest, from the surfaces of the clouds themselves. The fact that clouds are capable of reflecting sound and producing an echo is abundantly proved by the firing of guns—the sound created by heavy artillery being often much prolonged, and made sometimes to resemble very closely a roll of thunder, when there are heavy clouds in the sky.

A peal of thunder, as it strikes the ear, consists often not of a continued roll, as if the echoes were reflected from a range of surfaces at nearly equal distances from each other, but of a series of rattling detonations, and loud and heavy bursts of sound, following each other in

quick and irregular succession. These sharp and heavy claps, which burst forth at intervals in the midst of the general peal of reverberations, may be occasioned either by echoes coming from some particularly large surface of the cloud, or else from some portion of the line of the discharge which lies, as it is mathematically expressed, *at right angles to the axis of the eye*. This will be made plain by a brief explanation.

If the track of the lightning is in a line running directly *from* or directly *toward* the observer, then the sound will come to him, as has been already explained, by a gradual roll, that from the nearest end of the line reaching the ear first, and the rest in succession. If, on the other hand, the direction of the line of discharge is *across* the observer's line of vision, so that all parts of it are pretty nearly at an equal distance from him, then the whole sound will come to his ears at the same time, and the effect will be one loud overpowering peal, to be followed by a succession of similar peals, as the sound shall be returned by the echoes.

But in point of fact the track of the lightning is seldom or never entirely in a line running directly to or from the observer, nor directly *across* such a line; but, running in a

zigzag as it does, its course lies partly in one of these directions and partly in the other. The result will obviously be that the peal of thunder, as it reaches the ear, will consist of sharp and rattling bursts of sound following each other in quick succession, and passing gradually into the more continuous and distant reverberations.

We have seen thus how the repeated bursts and long-continued reverberations of sound in thunder are derived from one single instantaneous explosion, which is all that is directly produced by the electrical discharge. We now have to inquire in what way the electricity operates in awakening this elementary detonation.

It is simply by intensely heating the air along its passage, so as to occasion a sudden rarefaction and subsequent collapse of it, and this produces the sound. It acts thus in a manner very similar to that of gunpowder, which gives a report when it is fired by means of a sudden and violent expansion of the air, followed by an equally violent return, the shock of which produces the sound.

By the mechanical effects of electricity are meant its power to produce a rending, tearing, or disruption of any kind in the substances through which it passes. The engraving below shows the effect produced by a very powerful discharge from an electric battery through a mass of solid glass. Analogous effects result from its transmission through any medium that resists its passage. It is supposed, however, that it produces these effects, as it awakens sound, by suddenly and violently expanding the air or other elastic fluids which it finds in the pores of the substances disrupted. In this respect, too, its action is like that of gunpowder.

It seems not to be capable of exercising any impulsive force of its own. The heaviest electrical discharge directed against the slightest film of gold-leaf will not impart any motion to it, and yet a slight discharge will make a hole through a thick piece of pasteboard. But on examining the hole it is always found that the substance of the pasteboard is protruded *on both sides*, showing that the perforation has been effected not by an *impulse* from without, but by an explosive force from within. This explosive force is the sudden expansion of the air and aqueous vapor contained in the pores of the pasteboard by the intense heat developed by the electric spark in passing through.

When, therefore, we speak of lightning *striking*, we do not mean that it produces any of the effects of a blow. It simply *heats its way*, and all the mechanical effects which it produces are due to the sudden evolution of this heating, and the explosive expansion which it gives to any gases which it may meet in its track.

Its effects upon the bodily organization of men and of animals are various, according to

THE NATURAL LIGHTNING-ROD.

DISRUPTION OF GLASS.

the part of the system through which, in its apparent caprice, it chooses its way. In the year 1866 a coast guard was blinded by a discharge from the clouds as he was walking his rounds along the cliffs, on the coast of Scotland, watching for smugglers. He was made so completely blind that he was obliged to wait till he could obtain assistance, by his cries for help, in order to be guided home. Sometimes a person thus struck is merely stunned, and soon recovers from the shock. At other times life is completely and instantaneously destroyed.

The heat which electricity thus develops in passing, by sudden discharges, through the atmosphere is of very great intensity. It not only expands air and water so as to split trees and break down chimneys, but it will often set wood and other combustibles on fire, and even fuse metals and vitrify sand. A most extraordinary result sometimes ensues from this vitrifying power of electricity in the production of what are called *fulgurites*.

In particular localities, where the soil consists of sand of a certain quality, and the electricity enters it in a discharge from a cloud, the expansion of the air in the sand along its track as it descends into the ground drives out the sand in every direction, and the heat at the same time vitrifies it, so as to prevent its return. The result is a long tube, usually an inch or two in diameter, and often branching out into curious ramifications. Such tubes extend sometimes two or three feet into the ground. The interior surface of them is found to be glazed or vitrified, while the outside is formed of sand. These tubes can sometimes, by careful management, be taken out entire. Many of them have thus been taken out, and preserved in museums as curiosities. It is said that vitrified channels of this character have in some instances been traced, more or less distinctly, through the sand for a dis-

LIGHTNING ATTRACTED BY STREAMS UPON THE GROUND.

FULGURITE.

tance of twenty or thirty feet. The electric discharge is guided in its course by the facilities for its passage which it finds in its way. Water and the metals are the chief conductors, and they have accordingly, in general, great influence in determining the course of the discharge. It is sometimes the water that is contained in the pores and vessels of a tree; sometimes, probably, that which is falling through the air; and sometimes even that flowing in rivulets along the surface of the ground, that guides it on its way.

Sometimes the electric force is so attracted, as it were, by the facilities of this kind which it finds in its track, that it passes from the atmosphere to the earth gently and by slow degrees, gliding so quietly that, except at night, there is nothing to indicate its movement. The lightning-rod, with the sharp metallic points in which it terminates above, owes its efficiency, in a great measure, to this principle; and a natural lightning-rod is sometimes formed by a tree, the electricity being gathered from the atmosphere by every pointed leaf among the foliage, and flowing thence to the ground in a series of harmless flashes, of so feeble an intensity that only night and darkness can bring them into view.

TWO MOODS.

I PLUCKED the harebells as I went
Singing along the river-side:
The skies above were opulent
Of sunshine. "Ah! whate'er betide,
The world is sweet, is sweet," I cried,
That morning by the river-side.

The curlews called along the shore;
The boats put out from sandy beach;
Afar I heard the breakers' roar,

Mellowed to silver-sounding speech;
And still I sang it o'er and o'er,
"The world is sweet for evermore!"

Perhaps, to-day, some other one,
Loitering along the river-side,
Content beneath the gracious sun,
May sing, again, "Whate'er betide,
The world is sweet." I shall not chide,
Although *my* song is done.

FREDERICK THE GREAT.

FREDERICK ON THE FIELD OF BAUMGARTEN.

NO. VII.—THE CAMPAIGN OF MOLLWITZ.

FREDERICK, returning to Berlin from his six week's campaign in Silesia, remained at home but three weeks. He had recklessly let loose the dogs of war, and must already have begun to be appalled in view of the possible results. His ambassadors at the various courts had utterly failed to secure for him any alliance. England and some of the other powers were manifestly unfriendly to him. Like Frederick himself, they were all disposed to consult merely their own individual interests. Thus influ-

enced, they looked calmly on to see how Frederick, who had thrown into the face of the young queen of Austria the gage of battle, would meet the forces which she, with great energy, was marshaling in defense of her realms. Frederick was manifestly and outrageously in the wrong.

The chivalry of Europe was in sympathy with the young and beautiful queen, who, inexperienced, afflicted by the death of her father, and about to pass through the perils of maternity, had been thus suddenly and rudely as-

sailed by one who should have protected her with almost a brother's love and care. Every court in Europe was familiar with the fact that the father of Maria Theresa had not only humanely interceded in the most earnest terms for the life of Frederick, but had interposed his imperial authority to rescue him from the scaffold, with which he was threatened by his unnatural parent. Frederick found that he stood quite alone, and that he had nothing to depend upon but his own energies and those of his compact, well-disciplined army.

It would seem that Frederick was now disposed to compromise. He authorized the suggestion to be made to the court at Vienna, by his minister, count Gotter, that he was ready to withdraw from his enterprise, and to enter into alliance with Austria, if the queen would surrender to him the duchy of Glogau only, which was but a small part of Silesia. But to these terms the heroic young queen would not listen. She justly regarded them but as the proposition of the highway robber, who offers to leave one his watch if he will peaceably surrender his purse. Whatever regrets Frederick might have felt in view of the difficulties in which he found himself involved, not the slightest indication of them is to be seen in his correspondence. He had passed the Rubicon. And now he summoned all his energies—such energies as the world has seldom, if ever, witnessed before, to carry out the enterprise upon which he had so recklessly entered, and from which he could not without humiliation withdraw.

On the 19th of February, 1741, Frederick, having been at home but three weeks, again left Berlin with reinforcements, increasing his army of invasion to sixty thousand men, to complete the conquest of Silesia by the capture of the three fortresses which still held out against him. On the 21st he reached Glogau. After carefully reconnoitring the works, he left directions with prince Leopold of Dessau, who commanded the Prussian troops there, to press the siege with all possible vigor. He was fearful that Austrian troops might soon arrive to the relief of the place.

The king then hastened on to Schweidnitz, a few miles west from Breslau. This was a small town, strongly fortified, about equally distant from the three beleaguered fortresses—Neisse, Brieg, and Glogau. The young monarch was daily becoming more aware that he had embarked in an enterprise which threatened him with fearful peril. He had not only failed to secure a single ally, but there were indications that England and other powers were in secret deliberation to join against him. He soon learned that England had sent a gift or loan of a million of dollars—a large sum in those days—to replenish the exhausted treasury of Maria Theresa. His minister in Russia also transmitted to him an appalling rumor that a project was in contemplation by the king of England, the king of Poland, Anne, regent of

Russia, and Maria Theresa to unite, and so partition the Prussian kingdom as to render the ambitious Frederick powerless to disturb the peace of Europe. The general motives which influenced the great monarchies in the stupendous war which was soon evolved are sufficiently manifest. But these motives led to a complication of intrigues which it would be alike tedious and unprofitable to attempt to unravel.

Frederick wished to enlarge his Lilliputian realms, and become one of the powers of Europe. This he could only do by taking advantage of the apparent momentary weakness of Austria, and seizing a portion of the territory of the young queen. In order to accomplish this, it was for his interest to oppose the election of Maria Theresa's husband, the grand duke Francis, as emperor. The imperial crown placed upon the brow of Francis would invest Austria with almost resistless power. Still, Frederick was ready to promise his earnest concurrence in this arrangement if Maria Theresa would surrender to him Silesia. He had even moderated his terms, as we have mentioned, to a portion of the province.

France had no fear of Prussia. Even with the addition of Silesia, it would be comparatively a feeble realm. But France did fear the supremacy of Austria over Europe. It was for the apparent interest of the court of Versailles that Austria should be weakened, and, consequently, that the husband of the queen should not be chosen emperor of Germany. Therefore France was coming into sympathy with Frederick, and was disposed to aid him in his warfare against Austria.

England was the hereditary foe of France. It was one of the leading objects in her diplomacy to circumvent that power. "Our great-grandfathers," writes Carlyle, "lived in perpetual terror that they would be devoured by France; that French ambition would upset the Celestial Balance, and proceed next to eat the British nation." Strengthening Austria was weakening France. Therefore the sympathies of England were strongly with Austria. In addition to this, personal feelings came in. The puerile little king, George II., hated implacably his nephew, Frederick of Prussia, which hatred Frederick returned with interest.

Spain was at war with England, and was ready to enter into an alliance with any power which would aid her in her struggle with that formidable despot of the seas.

The czarina, Anne of Russia, died the 28th of October, 1740, just eight days after the death of the emperor. She left, in the cradle, the infant czar Iwan, her nephew, two months old. The father of this child was a brother of Frederick's neglected wife Elizabeth. The mother was the Russian princess Catharine of Mecklenburg, now called princess Anne, whom Frederick had at one time thought of applying for as his wife. Russia was a semi-barbaric realm just emerging into consideration, and

no one could tell by what influences it would be swayed. The minor powers could be controlled by the greater—constrained by terror or led by bribes. Such, in general, was the state of Europe at this time.

Austria was rapidly marshaling her hosts, and pouring them through the defiles of the mountains to regain Silesia. Her troops still held three important fortresses—Neisse, Brieg, and Glogau. These places were, however, closely blockaded by the Prussians. Though it was midwinter, bands of Austrian horsemen were soon sweeping in all directions, like local war tempests borne on the wings of the wind. Wherever there was an unprotected baggage-train or a weakly defended post they came swooping down to seize their prey, and vanished as suddenly as they had appeared. Their numbers seemed to be continually increasing. All the roads were swept by these swarms of irregulars, who carefully avoided any serious engagement, while they awaited the approach of the Austrian army, which was gathering its strength to throw down to Frederick the gauntlet on an open field of battle.

Much to Frederick's chagrin he soon learned that a body of three hundred foot and three hundred horse, cautiously approaching through by-paths in the mountains, had thrown itself into Neisse, to strengthen the garrison there. This was on the 5th of March. But six days before a still more alarming event had occurred. On the 27th of February Frederick, with a small escort, not dreaming of danger, set out to visit two small posts in the vicinity of Neisse. He stopped to dine with a few of his officers in the little village of Wartha, while the principal part of the detachment which accompanied him continued its movement to Baumgarten.

The leader of an Austrian band of five hundred dragoons was on the watch. As the detachment of one hundred and fifty horse approached Baumgarten the Austrians from their ambuscade plunged upon them. There was a short, sharp conflict, when the Prussians fled, leaving ten dead, sixteen prisoners, one standard, and two kettle-drums in the hands of the victors. The king had just sat down at the dinner-table when he heard, at the distance of a few miles, the tumult of the musketry. He sprang from the table, hurriedly mustered a small force of forty hussars and fifty foot, and hastened toward the scene. Arriving at the field he found it silent and deserted, and the ten men lying dead upon it. The victorious Austrians, disappointed in not finding the king, bore their spoils in triumph to Vienna. It was a very narrow escape for Frederick. Had he then been captured it might have changed the history of Europe, and no one can tell the amount of blood and woe which would have been averted.

It is perhaps not strange that Frederick should have imbibed a strong feeling of antipathy to Christianity. In his father's life he had

witnessed only its most repulsive caricature. While making the loudest protestations of piety, Frederick William, in his daily conduct, had manifested mainly only every thing that is hateful and of bad report. Still, it is quite evident that Frederick was not blind to the distinction between the principles of Christianity, as taught by Jesus and developed in His life, and the conduct of those who, professing His name, trampled those principles beneath their feet. In one of his letters to Voltaire, dated Cirey, August 26, 1736, Frederick wrote:

"May you never be disgusted with the sciences by the quarrels of their cultivators; a race of men no better than courtiers; often enough as greedy, intriguing, false, and cruel as these.

"And how sad for mankind that the very interpreters of Heaven's commandments—the theologians I mean—are sometimes the most dangerous of all! professed messengers of the Divinity, yet men sometimes of obscure ideas and pernicious behavior, their soul blown out with mere darkness, full of gall and pride in proportion as it is empty of truths. Every thinking being who is not of their opinion is an atheist; and every king who does not favor them will be damned. Dangerous to the very throne, and yet intrinsically insignificant.

"I respect metaphysical ideas. Rays of lightning they are in the midst of deep night. More, I think, is not to be hoped from metaphysics. It does not seem likely that the first principles of things will ever be known. The mice that nestle in some little holes of an immense building know not whether it is eternal, or who the architect, or why he built it. Such mice are we. And the Divine architect has never, that I know of, told His secret to one of us."

Notwithstanding these sentiments, the king sent throughout Silesia a supply of sixty Protestant preachers, ordained especially for the work. Though Frederick himself did not wish to live in accordance with the teachings of Jesus Christ, it is very evident that he did not fear the influence of that gospel upon his Silesian subjects. Very wisely the Protestant preachers were directed carefully to avoid giving any offense to the Catholics. They were to preach in barns and town-halls, in places where there was no Protestant church. The salary of each was one hundred and fifty dollars a year, probably with rations. They were all placed under the general superintendence of one of the army chaplains.

Every day it became more clear that Maria Theresa was resolved not to part with one inch of her territory, and that the Austrian court was thoroughly roused in its determination to drive the intrusive Prussians out of Silesia. Though Frederick had no scruples of conscience to prevent him from seizing a portion of the domains of Maria Theresa, his astonishment and indignation were alike aroused by the rumor that England, Poland, and Russia were con-

templating the dismemberment of his realms. An army of thirty-six thousand men, under the old duke Leopold of Dessau,¹ was immediately dispatched by Frederick to Götten, on the frontiers of Hanover, to seize upon that continental possession of the king of England upon the slightest indication of a hostile movement. George II. was greatly alarmed by this menace.

Frederick found himself plunged into the midst of difficulties and perils which exacted to the utmost his energies both of body and of mind. Every moment was occupied in strengthening his posts, collecting magazines, recruiting his forces, and planning to circumvent the foe. From the calm of Reinbeck he found himself suddenly tossed by the surges of one of the most terrible tempests of conflict which a mortal ever encountered. Through night and storm, almost without sleep and without food, drenched and chilled, he was galloping over the hills and through the valleys, climbing the steeples, fording the streams, wading the morasses, involved in a struggle which now threatened even the crown which he had so recently placed upon his brow. Had Frederick alone suffered, but few tears of sympathy would have been shed in his behalf. But his ambition had stirred up a conflict which was soon to fill all Europe with the groans of the dying, the tears of the widow, the wailings of the orphan.

Frederick deemed it of great importance to gain immediate possession of Glogau. It was bravely defended by the Austrian commander, count Wallis, and there was hourly danger that an Austrian army might appear for its relief. Frederick, in the intensity of his anxiety, as he hurried from post to post, wrote from every stopping-place to young Leopold, whom he had left in command of the siege, urging him immediately to open the trenches, concentrate the fire of his batteries, and to carry the place by storm. "I have clear intelligence," he wrote, "that troops are actually on the way for the rescue of Glogau." Each note was more imperative than the succeeding one. On the 6th of March he wrote from Ohlau:

"I am certainly informed that the enemy will make some attempt. I hereby, with all distinctness, command that so soon as the petards are come you attack Glogau. And you must make your dispositions for more than one attack, so that if one fail the other shall cer-

tainly succeed. I hope you will put off no longer. Otherwise the blame of all the mischief that might arise out of longer delay must lie on you alone."

On the 8th of March Leopold summoned all his generals at noon, and informed them that Glogau, at all hazards, must be taken that very night. The most minute directions were given to each one. There were to be three attacks—one up the river on its left bank, one down the river on its right bank, and one on the land side perpendicular to the other two. The moment the clock on the big steeple in Glogau should give the first stroke of midnight the three columns were to start. Before the last stroke should be given they were all to be upon the silent, rapid advance.

Count Wallis, who was intrusted with the defense of the place, had a garrison of about a thousand men, with fifty-eight heavy guns and several mortars, and a large amount of ammunition. Glogau was in the latitude of fifty-two, nearly six degrees north of Quebec. It was a cold wintry night. The ground was covered with snow. Water had been thrown upon the glacis, so that it was slippery with ice. Prince Leopold in person led one of the columns. The sentinels upon the walls were not alarmed until three impetuous columns, like concentrating tornadoes, were sweeping down upon them. They shouted "To arms!" The soldiers, roused from sleep, rushed to their guns. Their lightning flashes were instantly followed by war's deepest thunders, as discharge followed discharge in rapid succession.

But the assailants were already so near the walls that the shot passed harmlessly over their heads. Without firing a gun or uttering a sound these well-drilled soldiers of Frederick William hewed down the palisades, tore out the chevaux-de-frise, and clambered over the glacis. With axe and petard they burst open the gates and surged into the city.

In one short hour the gallant deed was done. But ten of the assailants were killed and forty-eight wounded. The loss of the Austrians was more severe. The whole garrison, one thousand sixty-five in number, and their *materiel* of war, consisting of fifty brass cannons, a large amount of ammunition, and the military chest, containing thirty-two thousand florins, fell into the hands of the victors. To the inhabitants of Glogau it was a matter of very little moment whether the Austrian or the Prussian banner floated over their citadel. Neither party paid much more regard to the rights of the people than they did to those of the mules and the horses.

But to Frederick the importance of the achievement was very great. The exploit was justly ascribed to his general direction. Thus he obtained a taste of that military renown which he had so greatly coveted. The king was, at this time, at his head-quarters at Schweidnitz, about one hundred and twenty miles from Glogau. A courier, dispatched im-

¹ Leopold of Anhalt-Dessau was one of the most extraordinary men of any age. His life was but a constant whirlwind of battle, almost from his birth in 1676, to his death in 1747. His face was of the "color of gunpowder," and his fearless, tumultuous soul was in conformity with the rugged body in which it was encased. The whole character of the man may be inferred from the following prayer, which it is said he was accustomed to offer before entering battle: "O God! assist our side. At least, avoid assisting the enemy, and leave the result to me." Leopold, called the *Old Dessauer*, and his son, the *Young Leopold*, were of essential service to Frederick in his wars. Pages might be filled illustrative of the character of this eccentric man.

THE ASSAULT ON GLOGAU.

mediately from the captured town, communicated to him, at five o'clock in the afternoon, the glad tidings of the brilliant victory.

Frederick was overjoyed. In the exuberance of his satisfaction he sent prince Leopold a present of ten thousand dollars. To each private soldier he gave half a guinea, and to the officers sums in proportion. To the old duke of Des-sauer, father of the young prince Leopold, he wrote:

"The more I think of the Glogau business the more important I find it. Prince Leopold has achieved the prettiest military stroke that has been done in this century. From my heart

I congratulate you on having such a son. In boldness of resolution, in plan, in execution, it is alike admirable, and quite gives a turn to my affairs."

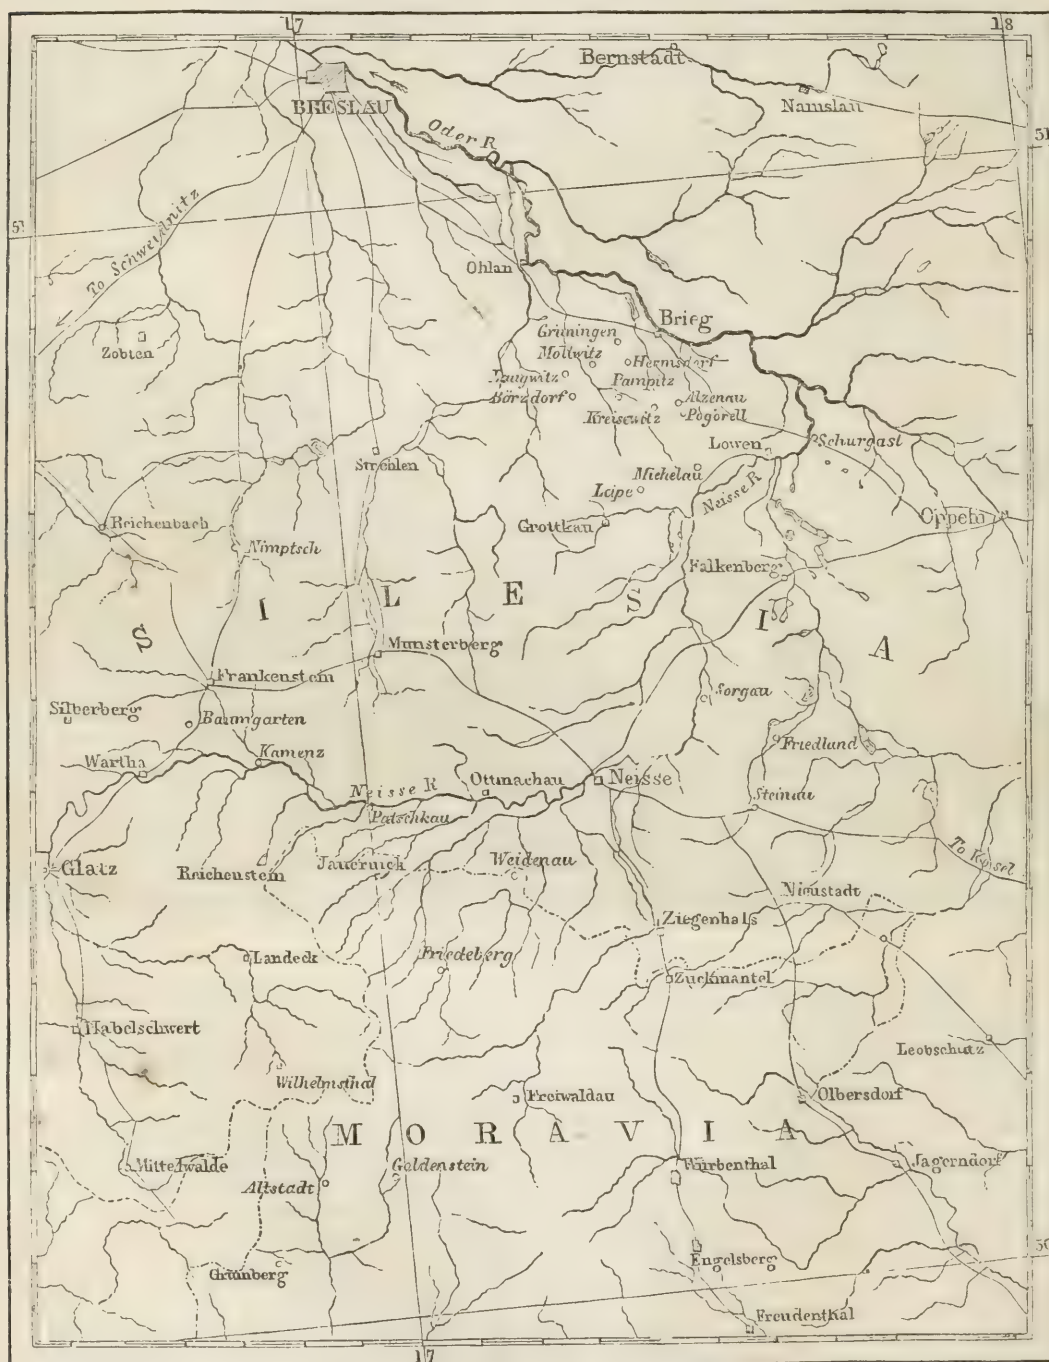

Leaving a sufficient force to garrison Glogau, the king ordered all the remaining regiments to be distributed among the other important posts; while prince Leopold, in high favor, joined the king at Schweidnitz, to assist in the siege of Neisse. Frederick rapidly concentrated his forces for the capture of Neisse before the Austrian army should march for its relief. He thought that the Austrians would not be able to take the field before the snow should

disappear and the new spring grass should come, affording forage for their horses.

But general Neipperg, the Austrian commander-in-chief, proved as watchful, enterprising, and energetic as Frederick. His scouting bands swarmed in all directions. The Prussian foraging parties were cut off, their reconnoiters were driven back, and all the movements of the main body of the Austrian army were veiled from their view. General Neipperg, hearing of the fall of Glogau, decided, notwithstanding the inclemency of the weather and the snow, to march immediately, with thirty thousand men, to the relief of Neisse. His path led through mountain defiles, over whose steep and icy roads his heavy guns and lumbering ammunition wagons were with difficulty drawn.

At the same time Frederick, unaware of the

movement of the Austrians, prepared to push the siege of Neisse with the utmost vigor. Leaving some of his ablest generals to conduct the operations there, Frederick himself marched, with strong reinforcements, to strengthen general Schwerin, who was stationed among the Jagerndorf hills, on the southern frontier of Silesia, to prevent the Austrians from getting across the mountains. Marching from Ottmachau the king met general Schwerin at Neustadt, half-way to Jagerndorf, and they returned together to that place. But the swarming horsemen of general Neipperg were so bold and watchful that no information could be obtained of the situation or movements of the Austrian army. Frederick, seeing no indications that general Neipperg was attempting to force his way through the snow-encumbered defiles of the

MAP ILLUSTRATING THE MOLLWITZ CAMPAIGN.

mountains, prepared to return, and, with his concentrated force, press with all vigor the siege of Neisse.

As he was upon the point of setting off, seven Austrian deserters came in and reported that general Neipperg's full army was advancing at but a few miles' distance. Even as they were giving their report sounds of musketry and cannon announced that the Prussian outposts were assailed by the advance-guard of the foe. The peril of Frederick was great. Had Neipperg known the prize within his reach the escape of the Prussian king would have been almost impossible. Frederick had but three or four thousand men with him at Jagerndorf, and only three pieces of artillery with forty rounds of ammunition. Bands of Austrian cavalry on fleet horses were swarming all around him. Seldom in the whole course of his life was Frederick placed in a more critical position.

It was soon ascertained that the main body of the Austrian army was fifteen miles to the southwest, at Freudenthal, pressing on toward Neisse. General Neipperg, without the slightest suspicion that Frederick was any where in his vicinity, had sent aside a reconnoitring party of skirmishers to ascertain if there were any Prussians at Jagerndorf. General Neipperg, at Freudenthal, was as near Neisse as Frederick was at Jagerndorf.

There was not a moment to be lost. General Neipperg was moving resolutely forward with a cloud of skirmishers in the advance and on his wings. With the utmost exertions Frederick immediately rendezvoused all his remote posts, destroying such stores as could not hastily be removed, and by a forced march of twenty-five miles in one day reached Neustadt. General Neipperg was marching by a parallel road about twenty miles west of that which the Prussians traversed. At Neustadt the king was still twenty miles from Neisse. With the delay of but a few hours, that he might assemble all the Prussian bands from the posts in that neighborhood, the king again resumed his march. He had no longer any hope of continuing the siege of Neisse. His only aim was to concentrate all his scattered forces, which had been spread over an area of nearly two thousand square miles, and, upon some well selected field, to trust to the uncertain issues of a general battle. There was no choice left for him between this course and an ignominious retreat.

Therefore, instead of marching upon Neisse, the king directed his course to Steinau, twenty miles east of Neisse. The siege was abandoned, and the whole Prussian army, so far as was possible, was gathered around the king. On the fifth of April Frederick established his headquarters at Steinau. On that same day general Neipperg, with the advanced corps of his army, triumphantly entered Neisse. Apprehensive of an immediate attack, Frederick made all his arrangements for a battle. In the confusion of those hours, during which the whole Prussian army, with all its vast accumulation

of artillery and baggage wagons, was surging like an inundation through the streets of Steinau, the village took fire and was burned to ashes. With great difficulty the artillery and powder were saved, being entangled in the narrow streets, while the adjoining houses were enveloped in flames. The night was intensely cold. The Prussian army bivouacked in the open frozen fields.

General Neipperg, as his men were weary with their long march, did not make an attack, but allowed his troops a short season of repose in the enjoyment of the comforts of Neisse. The next morning, the 6th, Frederick continued his retreat to Friedland, ten miles farther north. He was anxious to get between the Austrians and Ohlau. He had many pieces of artillery there, and large stores of ammunition, which would prove a rich prize to the Austrians. It was Frederick's intention to cross the river Neisse at a bridge at Sorgau, eight miles from Friedland. But the officer in charge there had been compelled to destroy the bridge, to protect himself from the Austrian horsemen, who in large numbers had appeared upon the opposite banks. Prince Leopold was sent with artillery and a strong force to reconstruct the bridge and force the passage. But the Austrian dragoons were encountered in such numbers that the enterprise was found impossible.

Frederick therefore decided to march down the river twenty miles farther, to Lowen, where there was a good bridge. To favor the operation, prince Leopold, with large divisions of the army and much of the baggage, was to cross the Neisse on pontoons at Michelau, a few miles above Lowen. Both passages were successfully accomplished, and the two columns effected a junction on the west side of the river on the 8th of April. The blockade of Brieg was abandoned, and its blockading force united with the general army.

General Neipperg had now left Neisse. But he kept himself so surrounded by clouds of skirmishers as to render his march entirely invisible. Frederick, anxious to unite with him his troops under the prince of Holstein Beck, advanced toward Grottkau to meet that division, which had been ordered to join him. The prince had been stationed at Frankenstein, with a force of about eight thousand, horse and foot. But the Austrian scouts so occupied all the roads that the king had not been able to obtain any tidings from him whatever.

It was Saturday, the 8th of April. A blinding, smothering storm of snow swept over the bleak plains. Breasting the gale, and wading through the drifts, the Prussian troops tramped along, unable to see scarcely a rod before them. At a little hamlet called Leipe the van-guard encountered a band of Austrian husars. They took several captives. From them they learned, much to their chagrin, and not a little to their alarm, that the Austrian army was already in possession of Grottkau.

Instantly the Prussian troops were ordered to

the right about. Rapidly retracing their steps through the streets of Leipe, much to the surprise of its inhabitants, they pressed on seven miles farther toward Ohlau, and encamped for the night. The anxiety of Frederick in these hours when he was retiring before the foe, and when there was every probability of his incurring disgrace instead of gaining honor, must have been dreadful. There was no sleep for him that night. The Prussians were almost surrounded by the Austrians, and it was quite certain that the morrow would usher in a battle. Oppressed by the peril of his position, the king during the night wrote to his brother Augustus William, who was at Breslau, as follows. The letter was dated at the little village of Pogerell, where the king had taken shelter.

"MY DEAREST BROTHER,—The enemy has just got into Silesia. We are not more than a mile from them. To-morrow must decide our fortune. If I die, do not forget a brother who has always loved you most tenderly. I recommend to you my most dear mother, my domestics, and my first battalion. Eichel and Schuhmacher are informed of all my testamentary wishes.

"Remember me always, but console yourself for my death. The glory of the Prussian arms and the honor of the House have set me in action, and will guide me to my last moment. You are my sole heir. I recommend to you, in dying, those whom I have the most loved during my life—Keyserling, Jordan, Wartensleben, Hacke, who is a very honest man, Fredersdorf, and Eichel, in whom you may place entire confidence.

"I bequeath eight thousand crowns (\$6000) to my domestics. All that I have elsewhere depends on you. To each of my brothers and sisters make a present in my name; a thousand affectionate regards to my sister at Baireuth. You know what I think on their score; and you know, better than I can tell you, the tenderness and all the sentiments of most inviolable friendship with which I am, dearest brother, your faithful brother and servant till death,

"FREDERICK."

To his friend Jordan, who was also in Breslau, he wrote:

"MY DEAR JORDAN,—We are going to fight to-morrow. Thou knowest the chances of war. The life of kings is not more regarded than that of private people. I know not what will happen to me.

"If my destiny is finished, remember a friend who loves thee always tenderly. If Heaven prolong my days, I will write to thee after to-morrow, and thou shalt hear of our victory. Adieu, dear friend; I shall love thee till death.

"FREDERICK."

It is worthy of notice that there is no indication that the king sent any word of affectionate

remembrance to his neglected wife. It is a remarkable feature in the character of the emperor Napoleon I. that in his busiest campaigns rarely did a day pass in which he did not write to Josephine. He often wrote to her twice a day.

Sunday morning, the 9th, dawned luridly. The storm raged unabated. The air was so filled with the falling snow that one could not see the distance of twenty paces; and the gale was piling up large drifts on the frozen plains. Neither army could move. Neipperg was in advance of Frederick, and had established his head-quarters at the village of Mollwitz, a few miles northwest of Pogerell. He had therefore got fairly between the Prussians and Ohlau. But Frederick knew not where the Austrian army was. For six-and-thirty hours the wild storm drove both Prussians and Austrians to such shelter as could be obtained in the several hamlets which were scattered over the extended plain.

Frederick dispatched messengers to Ohlau to summon the force there to his aid; the messengers were all captured. The Prussians were now in a deplorable condition. The roads were encumbered and rendered almost impassable by the drifted snow. The army was cut off from its supplies, and had provisions on hand but for a single day. Both parties alike plundered the poor inhabitants of their cattle, sheep, and grain. Every thing that would burn was seized for their camp-fires. We speak of the carnage of the battle-field and often forget the misery which is almost invariably brought upon the helpless inhabitants of the region through which the armies move. The schoolmaster of Mollwitz, a kind, simple-hearted, accurate old gentleman, wrote an account of the scenes he witnessed. Under date of Mollwitz, Sunday, April 9, he writes:

"Country, for two days back, was in new alarm by the Austrian garrison of Brieg, now left at liberty, who sallied out upon the villages about, and plundered black cattle, sheep, grain, and whatever they could come at. But this day in Mollwitz the whole Austrian army was upon us. First there went three hundred husars through the village to Grünigen, who quartered themselves there, and rushed hither and thither into houses, robbing and plundering. From one they took his best horses; from another they took linen, clothes, and other furnishings and victual.

"General Neipperg halted here at Mollwitz with the whole army before the village, in mind to quarter. And quarter was settled, so that a plow-farmer got four to five companies to lodge, and a spade-farmer two or three hundred cavalry. The houses were full of officers, and the fields full of horsemen and baggage; and all around you saw nothing but fires burning. The wooden railings were instantly torn down for fire-wood. The hay, straw, barley were eaten away, and brought to nothing. Every thing from the barns was carried out. As the whole

THE NIGHT BEFORE MOLLWITZ.

army could not lodge itself with us, eleven hundred infantry quartered at Laugwitz. Bärzdorf got four hundred cavalry; and this day nobody knew what would come of it."

Monday morning the storm ceased. There was a perfect calm. For leagues the spotless snow, nearly two feet deep, covered all the extended plains. The anxiety of Frederick had been so great that for two nights he had not been able to get any sleep. He had plunged into this war with the full assurance that he was to gain victory and glory. It now seemed inevitable that he was to encounter but defeat and shame.

At the earliest dawn the whole army was in motion. Ranked in four columns, they cautiously advanced toward Ohlau, ready to deploy instantly into line of battle should the enemy appear. Scouts were sent out in all directions. But, toiling painfully through the drifts, they could obtain no reliable information. The spy-glass revealed nothing but the winding-sheet of crisp and sparkling snow, with scarcely a shrub or a tree to break the dreary view. There were no fences to be seen—nothing but a

smooth, white plain, spreading for miles around. The hamlet of Mollwitz, where general Neipperg had established his head-quarters, was about seven miles north from Pogerell, from which point Frederick was marching. At the distance of a few miles from each other there were several wretched little hamlets, consisting of a few low, thatched, clay farm-houses clustered together.

General Neipperg was not attempting to move in the deep snow. He, however, sent out a reconnoitring party of mounted hussars under general Rothenburg. About two miles from Mollwitz this party encountered the advance-guard of the Prussians. The hussars, after a momentary conflict, in which several fell, retreated and gave the alarm. General Neipperg was just sitting down to dinner. The Prussian advance waited for the rear columns to come up, and then deployed into line. As the Austrian hussars dashed into the village of Mollwitz with the announcement that the Prussians were on the march, had attacked them, and killed forty of their number, general Neipperg dropped knife and fork, sprang from the table,

and dispatched couriers in all directions, galloping for life, to concentrate his troops. His force was mainly distributed about in three villages, two or three miles apart. The clangor of trumpets and drums resounded; and by the greatest exertions the Austrian troops were collected from their scattered encampments, and formed in two parallel lines, about two miles in length, facing the Prussians, who were slowly advancing in the same order, wading through the snow. Each army was formed with the infantry in the centre and the cavalry on the wings. Frederick was then but an inexperienced soldier. He subsequently condemned the want of military ability which he displayed upon this occasion.

"We approached," he writes, "marshal Neipperg's army without being discovered by any one man living. His troops were then cantoned in three villages. But at that time I had not sufficient experience to know how to avail myself of such an opportunity. I ought immediately to have ordered two of my columns to surround the village of Mollwitz, and then to have attacked it. I ought at the same instant to have detached my dragoons with orders to have attacked the other two villages, which contained the Austrian cavalry. The infantry, which should have followed, would have prevented them from mounting. If I had proceeded in this way I am convinced that I should have totally destroyed the Austrian army."¹

It was now about noon. The sun shone brightly on the glistening snow. There was no wind. Twenty thousand peasants, armed and drilled as soldiers, were facing each other upon either side, to engage in mutual slaughter, with no animosity between them—no cause of quarrel. It is one of the unrevealed mysteries of Providence, that any one man should thus have it in his power to create such wide-spread death and misery. The Austrians had a splendid body of cavalry, eight thousand six hundred in number. Frederick had but about half as many horsemen. The Prussians had sixty pieces of artillery, the Austrians but eighteen.

The battle soon began, with its tumult, its thunder-roar of artillery and musketry, its gushing blood, its cries of agony, its death convulsions. Both parties fought with the reckless courage, the desperation, with which trained soldiers, of whatever nationality, almost always fight.

The Prussians advanced, in their long double line, trampling the deep snow beneath their feet. All their banners were waving. All their bands of music were pealing forth their most martial airs. Their sixty pieces of artillery, well in front, opened a rapid and deadly fire. The thoroughly-drilled Prussian artillerymen discharged their guns with unerring aim, breaking gaps in the Austrian ranks, and with such wonderful rapidity that the unintermitted roar of the cannons drowned the sound of drums and trumpets.

The Austrian cavalry made an impetuous charge upon the weaker Prussian cavalry on the right of the Prussian line. Frederick commanded here in person. The Prussian right wing was speedily routed, and driven in wild retreat over the plain. The king lost his presence of mind and fled ingloriously with the fugitives. General Schulenberg endeavored, in vain, to rally the disordered masses. He received a sabre slash across his face. Drenched in blood he still struggled, unavailingly, to arrest the torrent, when a bullet struck him dead. The battle was now raging fiercely all along the lines.

General Römer, in command of the Austrian cavalry, had crushed the right wing of the Prussians. Resolutely he followed up his victory, hotly chasing the fugitives in the wildest disorder far away to the rear, capturing nine of their guns. Who can imagine the scene? There were three or four thousand horsemen put to utter rout, clattering over the plain, impetuously pursued by six or seven thousand of the finest cavalry in the world, discharging pistol-shots into their flying ranks, and raining down upon them sabre blows.

The young king, all unaccustomed to those horrors of war which he had evoked, was swept along with the inundation. The danger of his falling, in the midst of the general carnage, or of his capture, which was, perhaps, still more to be dreaded, was imminent. His friends entreated him to escape for his life. Even marshal Schwerin, the veteran soldier, assured him that the battle was lost, and that he probably could escape capture only by a precipitate flight.

Frederick, thus urged, leaving the main body of his army as he supposed in utter rout, with a small escort, put spurs to his steed in the attempt to escape. The king was well mounted on a very splendid bay horse. A rapid ride of fifteen miles in a southerly direction brought him to the river Neisse, which he crossed by a bridge at the little town of Lowen. Immediately after his departure prince Leopold dispatched a squadron of dragoons to accompany the king as his body-guard. But Frederick fled so rapidly that they could not overtake him, and in the darkness, for night soon approached, they lost his track. Even several of the few who accompanied him, not so well mounted as the king, dropped off by the way, their horses not being able to keep up with his swift pace.

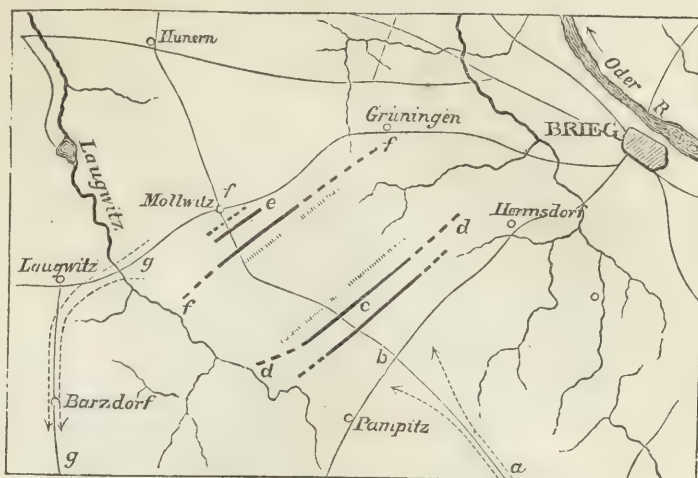

It was Frederick's aim to reach Oppeln, a small town upon the river Oder, about thirty miles from the field of battle. He supposed that one of his regiments still held that place. But this regiment had hurriedly vacated the post, and had repaired with all its baggage to Pampitz, in the vicinity of Mollwitz. Upon the retirement of this garrison a wandering party of sixty Austrian hussars had taken possession of the town.

Frederick, unaware that Oppeln was in the hands of the enemy, arrived, with the few of his suit who had been able to keep up with him,

about midnight before the closed gates of the town. "Who are you?" the Austrian sentinels inquired. "We are Prussians," was the reply, "accompanying a courier from the king." The Austrians, unconscious of the prize within their grasp, and not knowing how numerous the Prussian party might be, instantly opened a musketry fire upon them, through the iron gratings of the gate. Had they but thrown open the gate, and thus let the king enter the trap, the whole history of Europe might have been changed. Upon apparently such trivial chances the destinies of empires and of the world depend. Fortunately, in the darkness and the confusion, none were struck by the bullets.

At Oppeln there was a bridge across the Oder by which the king hoped to escape with his regiment to the free country beyond. There he intended to summon to his aid the army of thirty-six thousand men which he had sent to Götten under the "Old Dessauer." The discharge of the musketry of the Austrians blasted even this dismal hope. It seemed as though Frederick were doomed to drain the cup of misery to its dregs. And his anguish must have been intensified by the consciousness that he deserved it all. But a few leagues behind him the bleak, snow-clad plains, swept by the night-winds, were strewn with the bodies of seven or eight thousand men, the dying and the dead, innocent peasant boys torn from their homes, whose butchery had been caused by his own selfish ambition.

The king, in utter exhaustion from hunger, sleeplessness, anxiety, and misery, for a moment lost all self-control. As with his little band of fugitives he vanished into the gloom of the night, not knowing where to go, he exclaimed, in the bitterness of his despair, "O my God, my God, this is too much!"

Retracing his steps in the darkness some fifteen miles he returned to Lowen, where, by a bridge, a few hours before, he had crossed the Neisse. Taught caution by the misadventure at Oppeln, he reined up his horse, before the morning dawned, at the mill of Hilbersdorf, about a mile and a half from the town. The

king, upon his high-blooded charger, had out-riden nearly all his escort; but one or two were now with him. One of these attendants he sent into the town to ascertain if it were still held by the Prussians. Almost alone he waited under the shelter of the mill the return of his courier. It was still night, dark and cold. The wind, sweeping over the snow-clad plains, caused the exhausted, half-famished monarch to shiver in his saddle.

There is a gloom of the soul far deeper than any gloom with which nature can ever be shrouded. It is not easy to conceive of a mortal placed in circumstances of greater mental suffering than was the proud, ambitious young monarch during the hour in which he waited, in terror and disgrace, by the side of the mill, for the return of his courier. At length the clatter of hoofs was heard, and the messenger came back, accompanied by an adjutant, to announce to the king that the Prussians still held Lowen, and that *the Prussian army had gained a signal victory at Mollwitz.*

Who can imagine the conflicting emotions of joy and wretchedness, of triumph and shame, of relief and chagrin, with which the heart of Frederick must have been rent! The army of Prussia had triumphed, under the leadership of his generals, while he, its young and ambitious sovereign, who had unjustly provoked war that he might obtain military glory, a fugitive from the field, was scampering like a coward over the plains at midnight, seeking his own safety. Never, perhaps, was there a more signal instance of a retributive providence. Frederick knew full well that the derision of Europe would be excited by caricatures and lampoons of the chivalric fugitive. Nor was he deceived in his anticipations. There was no end to the ridicule which was heaped upon Frederick, galloping, for dear life, from the battle-field in one direction, while his solid columns were advancing to victory in the other. His sarcastic foes were ungenerous and unjust. But when do foes, wielding the weapons of ridicule, ever pretend even to be just and generous?

The king, upon receiving these strange and unexpected tidings, immediately rode into Low-

en. It was an early hour in the morning. He entered the place, not as a king and a conqueror, but as a starving fugitive, exhausted with fatigue, anxiety, and sleeplessness. It is said that his hunger was so great that he stopped at a little shop on the corner of the market-place, where "widow Panzern," served him with a cup of coffee and a cold roast fowl. Thus slightly refreshed, the intensely humiliated young king galloped back to his victorious army at Mollwitz, having been absent from it, in his terror-stricken flight, for sixteen hours.

The chagrin of Frederick, in view of this adventure, may be inferred from the fact that, during the whole remainder of his life, he was never known to make any allusion to it whatever.

After the king, swept away in the wreck of his right wing of cavalry, had left the field, and was spurring his horse in his impetuous flight, his generals in the centre and on the left, in command of infantry so highly disciplined that every man would stand at his post until he died, resolutely maintained the battle. Frederick William had drilled these men for twenty years,

as men were never drilled before or since, converting them into mere machines. They were wielded by their officers as they themselves handled their own muskets. Five successive cavalry charges these cast-iron men resisted. They stood like rocks dashing aside the torrent. The assailing columns melted before their terrible fire—they discharging five shots to the Austrians' two.

After the fifth charge, the Austrians, dispirited, and leaving the snow plain crimsoned with the blood and covered with the bodies of their slain, withdrew out of ball range. Torn and exhausted, they could not be driven by their officers forward to another assault. The battle had now lasted for five hours. Night was at hand, for the sun had already set. The repulsed Austrians were collected in scattered and confused bands. The experienced eye of general Schwerin saw that the hour for decisive action had come. He closed up his ranks, ordered every band to play its most spirited air, and gave the order, "Forward." An Austrian officer, writing the next week, describes the scene.

FLIGHT OF FREDERICK.

FREDERICK AT THE MILL.

"I can well say," he writes, "that I never in my life saw any thing more beautiful. They marched with the greatest steadiness, arrow straight and their front like a line, as if they had been upon parade. The glitter of their clear arms shone strangely in the setting sun, and the fire from them went on no otherwise than a continued peal of thunder. The spirits of our army sank altogether, the foot plainly giving way, the horse refusing to come forward—all things wavering toward dissolution."

The Austrians had already lost, in killed, wounded, and missing, four thousand four hundred and ten men. And though the Prussians had lost four thousand six hundred and thirteen, still their infantry lines had never for a moment wavered; and now, with floating banners and peals of music, they were advancing with the strides of conquerors.

Thus circumstanced, general Neipperg gave the order to retreat. At the double quick, the Austrians retired back through the street of Mollwitz, hurried across the river Lugwitz by a bridge, and, turning short to the south, continued their retreat toward Grottkau. They

left behind them nine of their own guns, and eight of those which they had captured from the Prussians. The Prussians, exhausted by the long battle, their cavalry mostly dispersed and darkness already enveloping them, did not attempt any vigorous pursuit. They bivouacked on the grounds, or quartered themselves in the villages from which the Austrians had fled.

On Wednesday, April 12, two days after the battle, Frederick wrote to his sister Wilhelmina, from Ohlau, as follows:

"MY DEAREST SISTER,—I have the satisfaction to inform you that we have yesterday¹ totally beaten the Austrians. They have lost more than five thousand men in killed, wounded, and prisoners. We have lost prince Frederick, brother of margraf Karl; general Schulenberg, Wartensleben of the carabineers, and many other officers. Our troops did miracles, and the result shows as much. It was one of

¹ It was the day before. But it is not surprising that the bewildered young king should have been somewhat confused in his dates.

the rudest battles fought within the memory of man.

"I am sure you will take part in this happiness, and that you will not doubt the tenderness with which I am, dearest sister, yours wholly,
"FREDERICK."

The king's intimate friend Jordan had accompanied him as far as Breslau. There he remained, anxiously awaiting the issue of the conflict. On the 11th, the day succeeding the battle, he wrote from Breslau to the king, as follows:

"SIRE,—Yesterday I was in terrible alarms. The sound of the cannon heard, the smoke of powder visible from the steeple-tops here, all led us to suspect that there was a battle going on. Glorious confirmation of it this morning. Nothing but rejoicing among all the Protestant inhabitants, who had begun to be in apprehension from the rumors which the other party took pleasure in spreading. Persons who were in the battle can not enough celebrate the coolness and bravery of your Majesty. For myself, I am at the overflowing point. I have run about all day announcing this glorious news to the Berliners who are here. In my life I have never felt a more perfect satisfaction. One finds at the corner of every street an orator of the people, celebrating the warlike feats of your Majesty's troops. I have often, in my idleness, assisted at these discourses; not artistic eloquence, it must be owned, but gushing full from the heart."

Frederick immediately sent an announcement of the victory to his friend Voltaire. It does not appear that he alluded to his own adventures. Voltaire received the note when in the theatre at Lisle, while listening to the first performance of his tragedy of *Mahomet*. He read the account to the audience between the acts. It was received with great applause. "You will see," said Voltaire, "that this piece of Mollwitz will secure the success of mine." *Vous verrez que cette piece de Mollwitz fera réussir la mienne.*

The distinguished philosopher Maupertuis accompanied Frederick on this campaign. Following the king to the vicinity of the field of battle, he took a post of observation at a safe distance, that he might witness the spectacle. Carlyle, in his peculiar style of word-painting, describes the issue as follows:

"The sage Maupertuis, for example, had climbed some tree, or place of impregnability, hoping to see the battle there. And he did see it much too clearly at last! In such a tide of charging and chasing on that Right Wing, and round all the field in the Prussian rear; in such wide bickering and boiling of Horse-currents, which fling out round all the Prussian rear-quarters such a spray of Austrian Hussars for one element, Maupertuis, I have no doubt, wishes much he were at home doing his sines and tangents. An Austrian Hussar party gets sight of him on his tree or other stand-point

(Voltaire says elsewhere he was mounted on an ass, the malicious spirit!)—too certain the Austrian Hussars got sight of him; his purse, gold watch, all he has of movable, is given frankly; all will not do. There are frills about the man, fine laces, cloth; a goodish yellow wig on him for one thing. Their Slavonic dialect, too fatally intelligible by the pantomime accompanying it, forces sage Maupertuis from his tree or stand-point; the big red face flurried into scarlet, I can fancy, or scarlet and ashy-white mixed; and— Let us draw a veil over it. He is next seen shirtless, the once very haughty, bluster, and now much humiliated man; still conscious of supreme acumen, insight, and pure science; and though an Austrian prisoner and a monster of rags, struggling to believe that he is a genius, and the Trismegistus of mankind. What a pickle!"

While in this deplorable condition Maupertuis was found by the prince of Lichtenstein, an Austrian officer who had met him in Paris. The prince rescued him from his brutal captors and supplied him with clothing. He was, however, taken to Vienna as a prisoner of war, where he was placed on parole. Voltaire, whose unamiable nature was pervaded by a very marked vein of malignity, made himself very merry over the misfortunes of the philosopher. As Maupertuis glided about the streets of Vienna for a time in obscurity, the newspapers began to speak of his scientific celebrity. He was thus brought into notice. The queen treated him with distinction. The grand duke Francis drew his own watch from his pocket, and presented it to Maupertuis in recompense for the one he had lost. Eventually he was released, and, loaded with many presents, was sent to Brittany.

In the account which Frederick gave, some years after, of this campaign, in his *Histoire de Mons Temps*, he wrote:

"The contest between general Neipperg and myself seemed to be which should commit the most faults. Mollwitz was the school of the king and his troops. That prince reflected profoundly upon all the faults and errors he had fallen into, and tried to correct them for the future."

VANITY OF VANITIES.

AH, woe is me for pleasure that is vain,

Ah, woe is me for glory that is past:

Pleasure that bringeth sorrow at the last,
Glory that at the last bringeth no gain!

So saith the sinking heart; and so again

It shall say till the mighty angel-blast
Is blown, making the sun and moon aghast,
And showering down the stars like sudden rain.
And evermore men shall go fearfully,

Bending beneath their weight of heaviness;
And ancient men shall lie down wearily,

And strong men shall rise up in weariness;
Yea, even the young shall answer sighingly,
Saying one to another, How vain it is!

THE ROB ROY ON THE JORDAN.*

AT HOME ON THE ROB ROY.

IN this Magazine† have been given accounts of three notable voyages performed in the canoe Rob Roy by Mr. Macgregor. He now gives an account of a new trip in the Rob Roy, mainly through waters hallowed by sacred associations. We follow Mr. Macgregor in styling the boat in which these voyages were made as “the Rob Roy;” although, in fact, each was performed in a different canoe, built expressly for the work which it was designed to perform, the leading idea in all being to furnish the greatest amount of accommodation in the least possible space, and with the least possible weight.

The canoe *Rob Roy Number Four* was to traverse waters where no dwellings were to be found on shore; the crew (that is, Mr. Macgregor) must, if need were, sleep on board the craft; and so something had to be sacrificed in order to furnish a commodious cabin. Mr. Macgregor we judge to be a muscular Christian of about six feet in height, with shoulders and hips corresponding. He laid himself flat on his back, and had himself measured for his canoe. Men are measured for garments and for coffins; but this is the first time where we have heard of a man’s being measured for a boat. This Rob Roy was a good fit for Mr. Macgregor—

* *The Rob Roy on the Jordan, Nile, Red Sea, and Genesareth, etc.*: a Canoe Cruise in Palestine and Egypt, and the Waters of Damascus. With Maps and Illustrations. By J. MACGREGOR, M.A. Harper and Brothers.

† *Cruise of the Rob Roy through Central Europe*: October, 1866.—*The Rob Roy in the Baltic*: September, 1867.—*The Voyage Alone in the English Channel*: May, 1868.

or, and is probably the smallest boat ever built which a man could make his home, sailing in it long and far, and sleeping on board comfortably. It is fourteen feet long, two feet two inches wide, and a foot deep, built of oak, with a cedar deck. Including mast (for which the lower joints of a fishing-pole were used), sails, and paddle, the weight is seventy-two pounds. About half the deck is cut away, leaving a “well” in which the “crew” sits while rowing or sailing. To fit up the “cabin” at night, two bits of wood are set up at the fore-part of the well, and connected at the tops by a cross-piece of bamboo. Upon this cross-piece the paddle is laid, one end resting upon the stern. Three feet of the deck consist of movable boards; these are taken up, laid upon the paddle, and form the roof; over all is thrown a light waterproof cloth, and the cabin is complete.

The fitting-up is simple. “The pillow,” says Mr. Macgregor, “is, of course, our clothes-bag, and for a bed there is an air-cushion three feet long and fourteen inches broad, with ribs across it, so made that it will not collapse. This bed is particularly comfortable, and, besides, answers for several other purposes. Its diminutive size has been ridiculed; but if you will try you will find that when the hips and shoulders are supported the rest of the body needs no support at all, except the head, which has a pillow, and the heels, which can rest on a roll of the top-sail.” Some of the “other purposes” served by the bed are thus described: “When traveling under a hot sun I place this bed behind me, with one end on deck, and the

A LARK ON LAKE MENZALEH.

middle of it is tied around my breast, so as to bring the upper end just under the long back leaf of my sun-helmet. It thus becomes an excellent protector against sun-stroke, especially when my course was toward the north, and my back was thus turned to the sun. Often I went ashore with the bed still dangling from my waist behind, while the wondering natives gazed at the 'Giaour' with his air-bag tail. The bed was useful, too, when I sat upon wet sand or grass or gravel; and it was always a good life-buoy in case of an upset."

On the 30th of October, 1868, the Rob Roy was landed from the steamer at Port Said, then a town of bustling wooden shanties which had sprung up from the sand at the mouth of the Suez Canal. Mr. Macgregor's first purpose was to explore this canal, then to paddle upon the Red Sea and the Nile, and afterward to try the Syrian lakes and rivers.

We pass briefly over the six weeks spent in Egypt. For twenty-five miles the canal is excavated through the shallow lake Menzaleh. The narrow sand-bank which separates the lake from the Mediterranean had not yet been cut through, and the Rob Roy was hauled across, and launched upon the motionless waters of the lake. It soon got entangled among the mud-banks; and the sharp little ragamuffins of an Arab village came scampering down in hopes of "backshish." They wallowed in the muddy water, their little round heads—looking like smooth cocoa-nuts, with only a single hair-lock left on the top of the shaven crown, by which lock, according to Mohammedan belief, the Prophet will drag them into Paradise—bobbing above the surface. They made themselves quite disagreeably familiar, and the canoe stood a fair chance of being overset. But Mr. Macgregor

understands how to manage boys. Selecting the stoutest and noisiest of the crowd, he hired him as "policeman," paying him a month's wages in advance. This advance was but a penny, and for this the lad made the others drag the canoe, with all the crew aboard, a long way through the shallows. This they did cheerfully, evidently thinking it a "jolly lark," however that may be expressed in Arabic. It is to be hoped that the penny was fairly divided among the crowd; though how they could have carried it is doubtful, since there could be no pockets in the suit of black mud which constituted their sole garment. This same difficulty afterward came under Mr. Macgregor's observation near Damascus. He gave a penny to a naked urchin, who held it a moment in his hand, and then requested the donor to put it by for him until he had finished his sports.

The waters of the canal being perfectly still, and each kilometer marked, gave Mr. Macgregor an opportunity to measure accurately his rate of paddling. He found that he could make a hundred double strokes, right and left, in five minutes, and that these would propel the canoe 542 yards, being at the rate of not quite four miles an hour, and that he could easily keep it up for eight hours out of the twenty-four.

At night, while passing through the shallow lagoons, the canoe was drawn up on the sand, and worked back and forth until it rested firmly, when the cabin was set up, and the voyager retired to rest. The loneliest spot was always chosen for this purpose, and a visitor seldom appeared. Once, however, on Lake Timneh, one came. He proved to be a jackall, who had probably been attracted by the smell of the supper which Mr. Macgregor was cooking by means

FLAMINGOES TAKING WING.

of his lamp. Flamingoes abound in these lagoons; and a comical sight was the manner in which they managed to take flight when disturbed by the canoe. Up one springs from the ooze in which he had been wading, his long legs dangling upon the surface of the water; upon which he walks, while his wings are struggling in the air, and his neck is stretched out in front. It is only after a long and doubtful scramble between earth, water, and air that the scrimp little body, with its pretty pink wings, can finally manage to carry off the long legs and snake-like neck.

Mr. Macgregor's anticipations of the success of the Suez Canal are far from sanguine. "A hole in the sand," he says, "is an excellent place for sinking capital. You can always dig it deep if people will pay the diggers. You can even keep it clear if you pay dredges rather than dividends. When Europe or Asia or Africa is at war, of course the canal is closed, and the expenses go on and the earnings stop. But

so far as concerns England, we have always got at Aden the cork in the other end of the bottle."—We imagine, however, that in case of a war between France and England, the cork would be easily drawn out.

At Cairo Mr. Macgregor witnessed a scene characteristic of the civilization which is being introduced into Egypt. "There is," he says, "knocking down, building up, opening out, planting, fencing, painting, cleaning, almost civilizing the old Egyptian capital. Great gangs of workmen are all day toiling here at

reconstruction. Puny children, herded in long flocks by cruel task-masters, who flog them with long sticks, are carrying on their heads straw baskets full of earth and stones. As they march they sing; but it is in a rhythm of slavery. The strongest repression of one's feelings is scarce enough to keep us from knocking that wretch over who has just belabored with his bludgeon a tender little girl. The evening brings a short relief even to the woe of these hapless little ones. They sit round in a circle with their baskets before them, while the roll-call is droned over by a task-master who can read."

Early in December Mr. Macgregor, with the Rob Roy on board, embarked on a steamer from Alexandria for Beyrout, in Syria, in order to begin his exploration of the sacred waters: "Abana and Pharpar, rivers of Damascus;" the Jordan, hallowed for evermore for that its waters wet in baptism the head of Him who "for us men and for our salvation came down

A NIGHT ON LAKE MENZALEH.

SLAVE CHILDREN AT CAIRO.

from heaven and was incarnate;" of the Lake of Gennesareth, around which cluster so many of His mightiest works and wonderful teachings; of the river Kishon, that "ancient river," which swept away the hordes of Sisera, with their nine hundred chariots of iron.

Beyrout is the one living town of Syria. Its roads and streets are far better kept than most of those in Alexandria or Cairo; its houses are altogether superior externally to those of Egypt. Schools have within a few years been established here, by missionaries from abroad. Mr. Macgregor found time during his two days'

stay to visit some of these. Here is a printing-press where the blind make Bibles for the blind, in raised characters, to be read by the fingers instead of the eyes. One of the most interesting sights which he saw in Beyrout was a blind man reading the Bible to a group of cripples seated around him.

The French are quietly and almost imperceptibly laying their hands upon Syria, foreseeing the time when the Mediterranean will be a French lake. French steamers, maintained by government subsidies, run all along the coast; French sign-boards hang over the

THE ROB ROY ON LEBANON.

SOURCE OF THE ABANA.

shops; French Napoleons are the common coin. Within ten years the French have built a fine road from Beyrout a hundred miles south-eastward to Damascus. This road is the only one in all Syria fairly passable for a wheeled vehicle; although it is said that some one has recently rode in a carriage from Joppa to Jerusalem. "This French road," says Mr. Macgregor, "is excellent; it is all marked down in kilometers, very well kept, and rolled down, fenced, and drained. But the toll of three francs for each mule is enough to deter hundreds of these from using the road; so they plod on their way along the old worn out, steep, muddy, slippery, winding bridle-path, which runs for miles along the carriage-way; and thus you see strings of heavy-laden asses, camels, and mules toiling along among boulders and sharp rocks, with their drivers ankle-deep in mud, while even the flat surface of the new road is used by a scant few, and no cart or carriage goes upon it except as a part of the Company's monopoly. It is a miserable sight, and this gift of France to Syria is like a crust to a toothless beggar."

But this road is not a "gift of France to Syria." It is a part of the grand scheme which is some day, not far remote, to make Egypt and Syria, like Algeria, a part of the French Empire. In its far-reaching extent this project of France is only to be compared with that of Russia for the ultimate acquisition of the shores of the Black Sea and the Bosphorus.

Over this French road Mr. Macgregor proposed to transport the Rob Roy until the head waters of the Abana were reached. His first purpose was to have the canoe borne upon

men's shoulders, two carrying it, and two others as reserves. But the first day's trial in crossing the snowy Lebanon proved that this plan was futile; and the Rob Roy was placed in a covered wagon; and so, crossing Mount Lebanon, "the White Mountains," whose summits rise to the height of 10,000 feet, overtopping by two-thirds our own New England White Mountains, then descending into the fertile plain of Cœlo-Syria, then again climbing the lower range of Anti-Lebanon, leaving the lofty peak of Hermon to the South, the canoeist reached Ain Fiji, a source of the ancient Abana, now called the Barada, the river which runs through Damascus.

This source of the Abana is in a dark dell shadowed by rugged cliffs. Here stand the ruins of two old temples, and the massive stones of an arch from out of which bursts a copious stream, which, after tumbling over rocks and boulders for seventy yards, plunges into a deep gorge where it meets another branch, the two forming the Abana. Near the village of Doomar, midway between Fiji and Damascus, ten miles from each, the Rob Roy was launched upon the river. Tidings of the approach of the canoe had reached Damascus by telegraph, and many persons had ridden out to witness the event. The river here resembles a swift Scotch salmon stream, with high snow-clad mountains on one side, and on the other bluff rocks, with here and there a bit of green wooded sward. The stream, now probably for the first time traversed by a human being, whirls through the deep gorge, sometimes obstructed by half-prostrate trees, whose branches interlace in the water, while their roots hold fast to

GORGE OF THE ARANA.

the bank. Here a heavy rock overhangs on the left, while the right shore is of soft mud. The whole picture of this is presented in an instant, as you round a point, and the decision must be instantly made, or the current itself will decide. "Strong to the left hand; seize that bough with the right! Swing round a quarter-circle, then duck the head for ten seconds under that thorn, and shoot across below the second tree; drift under the third, and five strokes will free us surely!"

The gorge passed safely, the canoe was borne

through a thicket of trees, with magnificent snowy crags behind them. The river is about sixty yards wide; but grows narrower every furlong, for little canals lead off the water to irrigate the cultivated fields. At least twenty times the canoeist had to jump out, and could only keep his footing in the swift current by the aid of a strong pole. Sometimes the boat had to be dragged ashore and hauled around some impassable obstruction. Now it was a clump of fallen trees; now a dam and mill-race. It took five hours to reach a point which is only

an hour's walk by the road which runs near by, often in plain sight. "At last," writes Mr. Macgregor, "the gorge loosened its hold upon us, and the canoe soon floated along the now placid river, while Damascus—old Damascus—gleamed out brilliant before me in the evening light, with its groves of green and white shining walls and airy minarets, a glorious scene. The far-famed approach to this city from the west, which unfolds to the traveler all its gentle beauty from a lofty hill, I had well remembered nineteen years ago. That is one of the sights of the world; but the sudden emerging now from rapids and rocks and dense jungles into the broad day, with such a picture before me, was more striking by far than the other view.

"And now," he continues, "the river itself seemed tired of the struggle, and it gurgled, almost sleeping, between the green river banks. There a most pleasant repast was spread on the soft grass, and the little knot of wondering Turks which soon collected was good proof that even Moslems, with all their apathy, could not help looking at a boat on the river. Then the Rob Roy glided into the town itself, under the bridges, round the dripping aqueducts, past the barracks, close up to the Pacha's palace; and two men carried her weary hull safe to the hotel, with colors flying, my dragoman, Hany, singing, mud-splashing Moslems wondering, and the hotel folks bowing. There on the cool water of the fountain in the court-yard I placed the canoe, with her blue sails set, and her golden flag reposing. Soon began the long line of visitors; each one as he left sent in a dozen friends to see. Even the Pacha of Damascus came, and the English Consul; and the Arabic newspapers gravely chronicled the arrival of the canoe in the same page with the movements of the Greek iron-clads, stirring up their fires then for a European war."

Of Damascus, the oldest inhabited city on the globe, Mr. Macgregor says little, and that little not altogether complimentary. "Damascus," he says, "has never yet, I think, been well described; and the reason may be that the traveler who has enough acuteness to paint a good word-picture of the town has sense enough to see that it is a sentimental humbug. In vain he tries to feel an admiration which he can not support by the appearance of the place. It may be the oldest, but in wet weather it is surely the filthiest of towns. It may be rich, but the mud-walls are what you see, and not the wealth. Damascus is a disappointment; its situation is its chief beauty, and once inside it you can not realize that outside these dirty lanes, tumble-down walls, gloomy shops, and crooked bazars are the lovely groves, the gushing fountains, the teeming gardens, and the glorious hills."

But the Rob Roy had come hither to solve a problem which had long ago presented itself to Mr. Macgregor. Twenty years before, he had looked over the plain of Damascus from the chapel whence the first view is caught. In the

distance he saw two huge aerial pillars. These he was told were sand-clouds, whirled aloft by the breeze, and that they were coursing over a silent and desolate region, almost unknown, through which ran the river Abana, which, though it had run there for ages, and had been described in prose and sung in verse, melted away in the desert, how and where nobody knew.

The Rob Roy had come to solve this mystery, by following the Abana down to its end. But, though this end was known to be in a morass hardly a score of miles from the city, nobody could give any reliable information. All agreed, however, that the morass or "lake" of Ateibeh was impenetrable; "full of whirlpools which sucked people down; of hyenas, panthers, and wild-boars, which ate people up; of fevers, agues, snakes, jungle, sun-strokes," and many other horrible things.

As a preliminary, Mr. Macgregor took a ride of a few miles eastward of Damascus along the course of the Abana. The speed of the river was moderate, for it was running through a plain; but its course was intricate, for it branched out into numerous channels, of which only one could be the right one, and nobody could tell which that one was. All these channels were for the purpose of irrigation. "It is only by a ride of this sort," says he, "that one can appreciate the richness and beauty of the Damascus plain, or can understand the marvelous ingenuity and perseverance with which the Abana has been led through the desert to water it. In Egypt, indeed, the sluices and canals are intricate enough, but nothing to what is done here. Banks, dams, lashers, and weirs seem to force the water into every nook of the country; to force it underground, and, as it were, even up hill, until every available drop has been wrung out for use. Below the shady groves, athwart bright, level meads, oozing over, murmuring beneath, and softly hurrying by, there is water every where, and nearly all this from that one river which has fed millions of people for ages of time; and if that river stopped, Damascus would perish."

As a result of his inquiries and observations, Mr. Macgregor decided to try the Abana with his canoe; and where it could not float, to have it conveyed on land. How this was to be done in a region where there was no such thing as a road was a question. After deep cogitation a very simple plan was devised. A couple of poles, a little longer than the canoe, were placed two feet apart, and fastened together by side-pieces. Upon this frame the Rob Roy, wrapped up in carpets, was lashed. This frame, holding the canoe, was tied upon the back of a stout horse, whose back was padded with a bag of straw, by way of cushion. And so wherever the horse could go, the canoe went safely with him.

A little eastward of Damascus the Rob Roy was launched upon the Abana, now grown lazy enough. The channel led through groves and

THE ATEIBEH MARSH.

orchards, meadows and ozier beds. Sleepy tortoises toppled down the banks; lazy land-crabs crawled out of sight; ducks, too fat to fly, scuttled off into the brakes. This region is thickly peopled, and the inhabitants would run or ride for miles to follow the strange sight of a boat, the first which has ever traversed these waters.

At length the Rob Roy, sometimes on water, and sometimes on horseback, got down to the lagoon of Ateibeh, half land, half water, and all mud, in which the Abana finally loses itself, hardly twoscore miles from the point where it bursts from the snowy mountains into the plain. Here was a "wide sea of shallow water, concealed by grass in tufts, like an Irish bog, and with soft, deceptive mud, deep holes, and trickling streamlets. Hundreds of cattle stood up to their stomachs in water; our mules plunged deep above their girths, and the men sank down repeatedly. One of the little donkeys disappeared under water, head, ears, and every thing; but a clever muleteer caught him by the tail, and we pulled him out." But by dint of much wading and paddling, the real mouth of the Abana was found; and here was passed the Christmas night of 1868. After all, the party were only twenty miles from a great city, and they had brought materials for an orthodox Christmas dinner. There were, among other things, a stuffed turkey and a plum-pudding swimming in the flames of brandy.

Leaving the Ateibeh Marsh, the Rob Roy was borne on horseback ten miles southward to Lake Hijaneh, in which the Pharpar, the other so-called river of Damascus, loses itself. The Pharpar does not, however, run by the city. Ateibeh is simply a morass; Hijaneh may be

called a pond, for here, in the centre of a dense jungle, is an open body of clear water; and near its edge is an island of a few acres, upon which are the massive walls of four strong buildings, in which no man has dwelt for untold generations. Wild-boars are its only inhabitants, and the surface was torn up by their deep ruts. Upon its borders, half buried in slime, were huge stones, ruined walls, and what look like the piers of a bridge, squared and cut for unknown purposes, by unknown men, at a time unknown. This deserted island appears to have been a fortress; but there is no record that before Mr. Macgregor any man has seen it since history has been written. The reeds surrounding the island are furrowed by boar tracks, along which the Rob Roy could be propelled; but the animals who made them were not seen.

Lake Hijaneh having been explored, Mr. Macgregor wished to take a look at the remains of the "Giant Cities," in the region toward the south which the Bible styles *Argob*—"the stone country"—and Bashan, wherein of old dwelt the giant Og, whose bedstead was of iron, nine cubits long. Over this region the Turks hold merely nominal control. After traveling a couple of days over bleak stony hills and dry river-courses, they saw what in the distance looked like an irregular mass of rock and stone a mile in length—the ruins of the commoner houses; but at the extremity were fifty or sixty structures almost uninjured. The walls of these, five or six feet thick, were of blocks of basalt, some of them well cut and polished. Many were two stories high, and some three. But every thing was of stone. The rafters, twelve or fourteen feet long, were of stone; the stairs and floors of stone; there were stone mangers in the stables,

STONE DOOR IN BASHAN.

stone cooking-places and troughs in the kitchens. The very doors and window-shutters were solid slabs of stone. The outer door of the house which they occupied was seven feet high and six inches thick, composed of two leaves, opening inward, moving upon stone pivots, yet so nicely balanced that they could be opened and shut with a finger. The window was furnished with a stone shutter four feet high, opening outward. How old these structures are no one knows. In the court-yard of one is a Greek inscription bearing date five centuries before Christ.

Returning to the Pharpar, the Rob Roy was launched upon its winding waters. It is certainly the crookedest of rivers—bend within bend—so that one had to paddle seven or eight miles in order to accomplish what would be a mile in a straight line.

On New-Year's Day, 1869, Mr. Macgregor returned to Damascus, and the next day set out to recross the mountains in search of the head waters of the Jordan. The Jordan and the Abana rise on opposite sides of the range of Anti-Lebanon, their head waters almost overlapping. Neither sends a drop of water to the sea, the one being lost in the deep gorge of the Dead Sea, and the other disappearing in the marsh of Ateibeh.

Skirting a spur of Mount Hermon they wound up a steep crooked path, amidst slippery rocks, projecting trees, loose stones, and deceitful mud. Two men could hardly hold the Rob Roy in its place upon the horse's back, as it swayed to and fro in the cold blasts which swept down from the snowy summits. On the fourth day they pitched their tents at Rukleh, a town hemmed in by piles of sharp gray rocks, tumbled together in wild confusion. Climbing these, one perceives

that in the olden time every nook of these jagged heights had been occupied. There were endless winding avenues, gardens hanging upon steep, retaining-walls to sustain the soil wherever a few square roods of space could thus be secured. Temples and altars and tombs harbored in clefts of the rock, all showed that Life, and its follower Death, had peopled these regions now so desolate. These remains go far to justify the accounts given in the text of the Hebrew Scriptures of the dense population which, in the time of the monarchy, once occupied all Palestine.

Still onward went the Rob Roy, mostly on horseback, but often borne by hand. The lay of the land showed that they must now be approaching the sources of the Jordan. They searched here and there, finding spring upon spring, whose waters were soon lost. At last, in a lonely field, one was discovered from which flowed a little brook. This grew gradually larger, and at length tumbled, in a pretty little cascade, over a low ledge of rock, and ran away in a bright dancing stream. This, which Mr. Macgregor styles *Ain Rob Roy*, "Rob Roy Fountain," he regards as the true source of the Jordan; that is, the farthest point from which a constant stream makes its way. This young Jordan, here called the Hasbany, is a pretty brook, growing larger and larger until it spreads into a pool. The natives averred this to be a thousand feet deep; but upon being sounded, the line touched bottom at the depth of eleven feet. Upon this pool the Rob Roy was first launched upon the Jordan. But the canoe had to be carried past a little cascade, which turns a mill, and then the stream is crossed by a narrow stone bridge, and then the Rob Roy fairly commenced her downward voyage.

HOOLEH ARCHITECTURE.

The river was still too narrow for paddling, and Mr. Macgregor, pole in hand, now mounted astride of the canoe, and now wading and dragging it after him, managed to make way for a space. At length the brook, now swollen by a sudden storm into a headlong torrent, rushed through a ravine where the canoe could not live; and the Rob Roy was borne overland to another branch, the head of which forms what is historically known as the source of the Jordan. The region is far from a peaceful one. Not long before the bodies of three men had been found under a tree hard by. At a place, now called Tell el Kady, once Dan, the extreme northernmost limits of the kingdom of Israel, this historic Jordan bursts forth in a noble spring, said to be the largest single source in the world. The "Tell" is a great mound, almost square, the sides being from 250 to 300 yards. In one corner is the spot where it is said King Jeroboam set up one of the two calves of gold, which the Israelites were to regard as the gods which had brought their fathers up out of the land of Egypt. This mound resembles the rim of a volcanic crater, sloping inward into a tangled thicket, around which is yet a low dais, apparently the remains of an amphitheatre. Out of this the water rushes into a circular basin a hundred feet wide. The Rob Roy was set afloat upon this pool, which Macgregor was assured was bottomless. He sounded it with a pole, and found its depth to be just five feet.

One more so-called "Source of the Jordan," had yet to be visited. This is at Banias, an hour's ride eastward from Tell el Kady. The way lies through a well-wooded region, whose fine clumps of oak give it an almost park-like character. Soon the traveler finds himself among beautiful ruins—bridges, walls, and prostrate pillars—the remains of the city of Cæsarea Philippi. This was probably the extreme northward point reached by our Saviour in his jour-

neyings upon earth. Near this place it was that Peter made the confession, "Thou art the Christ, the Son of the living God," and received the reply, "Thou art Peter, and upon this rock will I build my church."

The modern representative of Cæsarea Philippi is the insignificant village of Banias (an Arabic corruption of *Paneas*, "the city of Pan," for to this heathen deity was dedicated the fountain hard by, which is one of the three recognized sources of the Jordan, and by many esteemed the principal one). This fountain bursts forth in front of a deep cavern which pierces the foot of a steep limestone cliff. The stream flowing from this fountain soon loses itself in a wide morass, dotted here and there with patches of bright water.

After a course of half a dozen miles the stream (here called the Leddan), flowing from the fountain at Tell el Kady, unites with the Banias; and three miles below they are joined by the Hasbany. "Of these streams," says Thomson, "the Leddan is far the largest, the Banias the most beautiful, the Hasbany the longest." The united river now for the first time takes the name of Jordan, "the Descender"—rightly due both to the fast flow and enormous fall of the river, which also descends deeper into the bowels of the earth than any other river in the world.

To the meeting of the waters the Rob Roy was borne on horseback. The explorers put up for a night at a little mill. The host had come to this place a year before. He was a Christian, and four of his children had been massacred not long before by the Mussulmans. The only survivor was a beautiful girl of ten, "with a happy angelic look." Her father held out her little right hand to show how it was gashed and scarred, and worthless for needle-work. In the room was a heap of corn, and steelyards to weigh it; but not an article of furniture except a single straw mat. Soon a party of half a

dozen Arabs entered. They had come to buy gunpowder of the miller. He pulled out an old canvas sack upon which Mr. Macgregor had been leaning, smoking his pipe. The powder was lying perfectly loose in the sack. One of the visitors was also smoking a nargilleh. Each of the Arabs flashed a pinch of the powder in his rusty gun; and all began chaffering and wrangling over their purchases as they were weighed out. Some put the powder into bits of paper, others into goat-skin bags, and others placed it loosely in their pockets.

The river for some miles runs through the lagoon known as the Lake of Huleh. Herds of buffaloes and horses were browsing on the luscious green grass. The few hamlets are curiously various in their architecture. Here is a stone house with a flat roof; then a mud-wall, with a round top of reed matting; then dwellings with mats for the side walls and roofs shaped like a pulpit cushion, the tassels represented by heavy stones tied with straw ropes to keep the roof in place; then are black Arab tents, with woven reeds at the sides; and then regular tents: every variety of tent and thatch and mud and mat combined.

The Rob Roy was launched upon the Jordan; the stream, about a hundred feet wide, running swiftly on a course almost as winding as that of the Pharpar. Mr. Macgregor sent his attendants with the animals to skirt the edge of the morass, while he alone in the canoe undertook to paddle down the river. He had gone a few miles when all at once he saw a head peering over the dense fringe of canes. Then there was a yell, replied to by answering yells; and soon a crowd appeared on the banks, dancing and shouting ferociously. The current bore the canoe along too rapidly for them to keep up

with it; but they cut across the bend, and saluted the stranger with a harmless shower of clods. At the next bend the crowd, now increased to half a hundred—men, women, and children—were ahead. At the bend the voyager was again saluted by a fresh shower of missiles, and the cry, in Arabic, "To land! to land!" He made a polite bow, and answered *Ingleez*, "Englishman," and paddled along. Half a dozen brawny fellows flung off their garments and plunged into the water, swimming, "dog-fashion," in a splendid manner; but yet they were no match for the canoe.

At the next bend they were still further ahead, and ready for action. They had drawn up in a line, some standing waist-deep in the water, others swimming. Mr. Macgregor floated close to one of the swimmers, splashed him in the face with the paddle, and slipped past him. The crowd on shore set up a laugh. One stout fellow made a magnificent dive from the bank and came up by the stern of the canoe, with his arm over the deck. The Englishman shoved him off with his paddle, saying, in the best Arabic at his command, "Thanks!" as though he had received some signal service. He had run the blockade; but it was of no avail. The bank was lined by an ever-increasing crowd. Some had spears, some ox-goats, others huge round-headed clubs. Another shower of missiles came harmlessly, not one hitting even the canoe.

Then arose a cry: *Baroda! baroda!* "The gun! the gun!" and in an instant Macgregor saw several long guns pointed at him. But only one of the fellows seemed at all inclined to fire. This one looked as though he meant "business." He examined his priming, cocked his piece, and brought the muzzle to bear, at a

THE ROB ROY A PRIZE.

range of hardly a score of feet. A vigorous stroke of the paddle and a shot from the gun were simultaneous—the ball splashing close astern. The chase was clearly up; the canoe stopped. “Not fair to use a gun!” shouted the canoeist. But the water was now full of naked swimmers. Suddenly the canoe was pulled down from behind. The same big fellow who had a few minutes before made the magnificent dive had got hold of it with one hand, while in the other he brandished the shank-bone of a buffalo. He made a pass with it, which was warded off by the paddle. But by this time others had laid hold, and the Rob Roy was a prize.

“Backshish!” was now insinuated. “Yes; but to the sheikh.” Meanwhile, Macgregor commenced parleying with his chief captor, affectionately patting his bare black poll, as one pats the head of a mastiff. “Not fair to use that,” said he, pointing to the bone club. “Not fair to use that,” replied the Arab, pointing to the paddle. The fellow became pacified, and was highly elate when the prisoner formally appointed him as his protector. Macgregor now tried his skill at charming the mob, who had begun to grow good-natured; but there is nothing so uncertain as the temper of a mob. “I am English,” he said. “Friends,” they answered. “One Englishman”—holding up one finger—“all the rest Arabs,” he continued, holding up both hands. The crowd was tickled, and set up a laugh, in which the captive joined heartily. One little imp of mischief tried to break up the harmony. Seizing a huge lump of mud, she dashed it down upon the canoe. It was an even chance yet which side the mob would take. But Macgregor was equal to the occasion. With a look more of sorrow than of anger, he pointed silently at the great muddy spot on the clean top of the canoe. The natives looked on for a moment in silence; and then, as by a single impulse, they seized the girl and carried her off; but the sound of heavy thwacks and loud screams evinced that she was undergoing severe discipline.

In the confusion the captive almost succeeded in making off; but was again captured. He refused to quit the canoe; and, before he fairly knew what was going on, he found himself and canoe lifted bodily out of the water, and borne up the steep, muddy bank, and off to the tent of the sheikh, in which the canoe was deposited. Macgregor, with grave courtesy, advanced to the sheikh, shook his hand, informed him that he was an English traveler on his way to the lake, and would rest in the tent until the sun was cooler. The sheikh went out to consult with his cabinet; in an hour he came back, saying, “You can not go to the lake.” “I must.” “Impossible,” replied the sheikh, with a little wink of the eye. Macgregor replied by a wink, and went out. The Englishman saw that the Arab was open to an “arrangement.”

The wife of the sheikh now came in, and Macgregor laid himself out to make himself

agreeable. He showed her his canoe with all its fittings—bed, lamp, compass, and cooking apparatus. The woman, who was “quite refined and very intelligent,” was lost in amazement, and full of compassion, when he complained that he, a stranger and alone, was losing all the fine sunshine. She brought in her husband, that he also might see the wonderful canoe. While Macgregor was showing it, he managed to open his hand so that the sheikh might see a gold Napoleon. “*Shwei—h-s-sh,*” whispered the Arab; and the Englishman knew that the bargain was as good as made.

But who ever heard of an off-hand bargain with Arabs? The council of the sheikh came in, with their decision: “You can’t go to-day, but shall have a horse to-morrow.” The negotiation went on; but on the part of the Arabs it always came back to the one point—“backshish.” All this time no food had been offered to the stranger. To eat together, and especially to take salt together, is the one inviolate pledge of amity. Macgregor undertook to gain this pledge. He set his little cooking apparatus in operation, and soon, by the help of “preserved soup,” had a dish ready. Its flavor fell pleasantly on the Arab olfactories. Then he opened a little box—a snuff-box, in fact—filled with a white granular substance looking like powdered sugar. This he offered to the sheikh, who placed a little in his mouth. In an instant Macgregor had swallowed the remainder, and gave the Arab a hearty thump on the back. The sheikh made a rather wry face. “What is it? Is it sugar?” asked the by-standers. “No; it’s salt,” replied the sheikh. The stranger had fairly eaten salt with the Arab, in his own tent, and so for a whole day he had become the guest of the sheikh, who was bound by the most stringent code of his race to protect him at all hazards, even though he had been the murderer of his own son.

Now came a bit of by-play as to the way in which the yellow Napoleon should pass from the English traveler to the Arab sheikh. The transfer must be made, but in such a way that no “injunction” should reach it, and nobody be able to testify how it was done. Traveler and sheikh find themselves alone. Traveler’s hand, holding the coin, slips accidentally into that of sheikh. Sheikh pushes it away, with virtuous, but very gentle, indignation. All this time the parties of the first part and of the second part stand side by side, looking straight ahead, their hands behind their backs, never fairly separated. The yellow representative of the French Emperor is somewhere among those ten fingers. Now one five had it; then the other five. At length the Englishman found his hand empty; but we do not think he can testify, “of his own knowledge,” whither the Napoleon went.

At all events the sheikh went away to talk with his cabinet. He did not reappear; but the premier announced the decision: “You can go to-morrow.” But this did not at all

suit Macgregor. He had bought the court, and every body knew it. So he pulled out an old copy of the *Times*, merely saying, "To-morrow! No! I'm English;" and went on reading the newspaper. In five minutes an official appeared, announcing that the traveler might leave at once. This did not quite satisfy the captain of the Rob Roy. He insisted that the Arabs must carry the canoe back to the river. This was done with as much formality as the case admitted. The Rob Roy with its indomitable commander was again set afloat upon the Jordan, amidst the congratulations of the Arabs.

But the day's adventures were by no means over. The canoe somehow got out of the true river channel, and was involved in the thick reeds of the marsh, through which there was no possibility of making way. So back the Rob Roy had to go; and the captain was lodged in the place which he had left in the morning—not, however, in the tent of the sheikh, who was somewhat ashamed that some of his people had tried to get backshish after he had made "things right." Instead of the royal abode, Mr. Macgregor supped in the tent of the premier, with a large and distinguished circle of Arabs. Prominent among the guests was a lively youngster to whom Macgregor took special fancy, which was not lessened when he learned that this was the identical person who had all the morning kept his gun trained at the voyager's head.

Macgregor went to rest, with all sorts of schemes for escape running through his head. Toward morning he heard a distant shout, "Rob Roy!" An answering response was given; and soon Hany, the faithful dragoman, came upon the scene, followed by the rest of the Englishman's attendants.

It was beautiful to see how Hany took matters into his own hands. He made the old premier bestir himself; called up all the Arabs, and gave them a sound rating. One of them demurred a little, and got kicked for his impudence. Hany managed to pick a bit of apparent quarrel with another of Macgregor's attendants, Latoof by name, who had failed to be prompt in blacking the master's boots. "Don't mind this," whispered the dragoman to his employer, "Latoof and I have arranged it all." To the Arabs Hany was contemptuous; to the Englishman apparently most abject. "You see," he exclaimed to the natives, "how like grasshoppers you are before me; yet I am the slave of the Howaja—and him you have dared to insult!"

Mr. Macgregor ventured to intimate that

RAFT ON LAKE HOOLEH.

this was all humbug. Hany's reply was sharp to the point: "Without humbug we could never manage these men." Hany fairly took the Arabs down. He got up for them a rather sumptuous repast, at which the English Lord had to sit and feign hunger. For all this he had to pay. The amount was not very exorbitant. "I had," he says, "a feast, and a lodging, and porters, and protection, and excellent fun; and all for the very reduced tariff of 16s. 4d."

On the lagoon, where he re-embarked next day, Macgregor saw a native afloat on a bundle of reeds, which he punted along with a long pole, his spear sticking up like a mast. This was the first native water-craft which he saw in Syria, and it and five little boats on Lake Gennesareth probably make up every vessel in the country. The lagoon, at its lower end, terminates in the little Lake Hooleh—the biblical "Waters of Merom." After several fruitless attempts to follow the Jordan through the marsh, Mr. Macgregor had the Rob Roy borne overland to the lake, which he circumnavigated, and was rewarded by the discovery of the spot where the river enters it. The stream is bordered on each side by a wall of papyrus, the stems standing so thick that a bird can not penetrate, and the utmost exertions could only force the sharp bows of the canoe a yard into the dense thickets. Mr. Macgregor is apparently the only man who for centuries has seen this mouth of the Jordan.

Lake Hooleh is 150 feet above the level of the ocean. Ten miles below, in a straight line, is the Lake of Gennesareth, which lies 653 feet below the ocean level. In ten miles, therefore, the Jordan falls 800 feet. The river soon becomes a roaring torrent in which no boat could live. The Rob Roy was therefore borne by land, keeping as nearly as possible to the channel of the river; and was safely set afloat upon

the lake hallowed for evermore by the presence of Him who often sailed upon its waters and trod its shores.

The sacred sea or lake is designated in Scripture by four names. These, with some merely orthographical variations, are, "Chinnereth," "Gennesareth," "Galilee," and "Tiberias." Its shape is almost like that of a pear, the stem being at its lower extremity. Its extreme length is about fourteen miles; greatest breadth, seven miles. Its average depth is about 100 feet, the deepest soundings 160 feet. It occupies the first of the great depressions by which the valley of the Jordan sinks below ocean level. The Rob Roy was for a whole fortnight employed in the navigation and circumnavigation of this lake. Mr. Macgregor paddled around and across it; and his narrative forms a most valuable addition to our stores of information respecting one of the most interesting portions of the Holy Land. The lake itself remains unchanged. It is still swept over by sudden storms, as it was almost nineteen centuries ago, when the Saviour walked upon its waters. One such storm the Rob Roy encountered, narrowly escaping wreck. In the days of our Lord its waters were flecked by the boats of fishermen. A generation after, Josephus got together, as he says, 230 little boats for an enterprise against the Romans. Not long after, if we may believe him, there was a great naval battle fought upon the lake, the water of which was colored with blood, and the shore strewn with corpses. If after that, for seventeen centuries, there were vessels on the lake, history has no record of them. But if the waters are unchanged, the country around is altered. Saving the flea-bitten town of Tiberias, there is no place of ancient note whose site can be positively identified. Capernaum, the "own city," the "home" of our Lord, lay somewhere upon the

western shore of the lake; but where no man can now certainly say. Robinson places it at one point, Thomson at another; Macgregor agrees with Robinson.

The whole length of the Jordan, measuring in a direct line, is 120 miles; or about 200 miles, measuring the windings of channel. From the Lake of Gennesareth to the mouth is 70 miles, in which the river descends about 650 feet, and falls into the Dead Sea 1300 feet below the level of the Mediterranean, fifty miles distant. Could a channel be cut between the two waters, a narrow lake nearly 200 miles long would be formed, more than 3000 feet deep in its lowest part. The Jordan was never navigable, and it appears to have been only twice descended in a boat: in 1847, by the English Lieutenant Molyneux, who lost his life on the Dead Sea; and in 1848, by the American Lieutenant Lynch. The Rob Roy could easily have gone down to the Dead Sea; but that has been often described, and the passage, as shown by Lynch, presents nothing which can not be seen from the banks. Mr. Macgregor had gone mainly to see what could be seen only in a boat, and what no boat had ever done before. So, after venturing a few miles down as far as to the rapids, where Lynch with his two heavy boats was detained for hours, but which the Rob Roy passed in a few minutes, the canoe was once more put on horseback, and borne over the plain of Esdraelon, past Nazareth and Cana, to the Bay of Acre, and embarked on the "ancient river" Kishon and the Belus, famous as the spot where, according to doubtful story, glass was first discovered. Then, after a land journey to Jerusalem and the Dead Sea, Macgregor shipped his canoe to Alexandria, and thence back to England, reaching Southampton on the 9th of April, 1869—six months, to a day, from the time when it had set out.

A STORM ON GENNESARETH.

THE HOT CURRENT OF THE ATLANTIC.

A NEW THEORY OF ITS FOUNTAIN AND FLOOD.

A SUBMARINE VOLCANIC ERUPTION.

OF all the works of the Creation, Adam only excepted, not one has attracted more interest than the Sea. Although every blade of grass, however tiny, is in itself a museum of wonders, defying the highest human and angelic art to reproduce it, yet, by the testimony of Scripture, the master-pieces of the Divine Craftsman are, emphatically, "in the deep." If the geologist traces His mysterious "foot-prints" in subterranean slate and sandstone, and the telescopist sees Him in the heavens afar off, it has been reserved for the humble geographer to draw nearer, within the very sound of His footfall, whether He marches by in the steady sea-current, or whether, as of old at Gennesareth, He walks upon the stormy waves; for "His way is in the sea, and His path is in the great waters."

Fretted and tossed, as it is, by many and conflicting forces, the Ocean is to be viewed as an organic mass, living, breathing, instinct with vitality, as truly as the plant or the animal. "Its vast surface," to use the image of Schleiden, "rises and falls as if it had been gifted with the power of a gentle respiration." Seemingly impressible and sensitive to the faintest breeze that fans it, with stately grandeur it rolls calmly on in its appointed channels, in the very teeth of the hurricane, and against the fury of the typhoon and the cyclone. Mythology represented it as the plaything of an impotent deity, obedient to his trident; modern poetry paints it as an ungoverned and implacable giant; true science reckons it, however, as a part of the terrestrial machinery, simple yet grand, so contrived and so regulated that all its movements, "Quam fluctus diversi, quam

mare conjuncti," combine to render the earth a fit abode for man.

It is from this stand-point, which, we shall assume, science has attained, that we now propose to consider one of the most remarkable of all oceanic phenomena—*The Gulf Stream of the Atlantic*.

The winter of 1869, throughout the British Isles, was marked by an extraordinary display of mild and genial weather. Early in the year, however, and, strange to relate, at the very time when those balmy influences, which have been so generally conceded to the agency of the Gulf Stream, were felt to be most potent and paramount, the Royal Geographical Society entertained a serious discussion as to whether there be any such thing as a Gulf Stream. Metaphysicians tell us of one of their

number, the unhappy victim of his own speculations, who, in the ardor of his conviction that existence could be affirmed only of mind, actually denied that he had a body. It is, therefore, not without some countenance and parallel, that these geographers (for blessings seldom brighten except as they take their flight) should challenge as a myth a living reality, and one which, in its benign and salutary offices to them, has no equal but the Sun. But, had no such challenge passed, and no such question been mooted, the greatly increased interest and importance of the subject, which has been illumined only by an occasional and straggling ray of light since Sir John Herschel's article in the "Encyclopedia Britannica," ten years ago, render its revival almost a necessity. Of course the intelligent reader will not expect, within the narrow limits of a magazine article, an elaborate or scientific treatise. But no pains will be spared to make every topic introduced clear to the mind even of the inquirer least accustomed to pursue such investigations.

"I regard it as proved," wrote Columbus, in the diary of his third voyage to the New World, when seeking to enter the tropics near the meridian of Teneriffe, "that the waters of the sea move from east to west as do the heavens; that is to say, like the apparent motion of the sun, moon, and stars." However we may explain this westerly flow of the vast watery masses in the equatorial seas, the fact remains as one of the best attested and most unquestioned of oceanic phenomena. Over the torrid and liquid wastes, both of the Pacific and Atlantic, sweeps this mighty and majestic stream, steady, per-

PHOSPHORESCENT SEA.

ennial, and as unfailing as the stars in their courses. In the Pacific, notwithstanding it must needs find its impeded way through the meshes of the Polynesian archipelagoes, it yields to no resistance, presses on to the shores of the palmy Philippines and Formosa, whence it pours its floods, in part, to the north, off the coasts of Japan, and in part through the China, Celebes, and Java seas, into the basin of the Indian Ocean. Some have supposed that, originally, these channel-ways to the south

were made by the westwardly washing of the water, rending Australasia from the continent of Asia. The breadth of the equatorial current of the Pacific exceeds three thousand miles.

The equatorial current of the Atlantic, which chiefly concerns us now, has its genesis near the coasts of Senegambia and Liberia, on the west of Africa. It sets out in its movement to the west with no obstacles in its route. The Cape Verd Islands, within two days' easy sail

of the coast of Africa, are wide-opened for its passage. Even here, however, where the current impinges on the islands, the breakers are said to be peculiarly grand. But from this point, in constantly increasing volume and velocity, and moving in something like the arc of a great circle, it rolls on for 2850 miles, until its limpid billows break in foam over the eastern shores of the Lesser and Windward Antilles. These islands, to the number of forty-seven, stand out in bold array, formed into a crescent-shaped rampart, as if erected for the very purpose of disputing the passage of the great current into the Caribbean Sea. Could all these barriers be removed, the passage-way into that sea on the east would be less than five hundred miles wide. The huge island bastions, however, arrest and divert a vast quantity of the water, which, baffled here, issues northward in a mass of great importance. Enough water, notwithstanding the insular obstacles, has been forced through them to form a strong continuation of the old stream in the Caribbean Sea. This, regaining some of its lost momentum, runs rapidly on toward the Gulf of Mexico. Fragment as it is of the original current, it passes through the Yucatan Channel in such force and size as to have led Sir John Herschel to venture the assertion that "the excavation of the Gulf of Mexico and the Caribbean Sea is an evident effect of the continued and powerful action of the set of the great South Atlantic current, and which, unless counteracted by other causes, must sooner or later cut through the Isthmus of Darien."

The breadth of the equatorial current of the Atlantic at its commencement is 160 miles; opposite Cape Palmas it is 360 miles; when the current has crossed the ocean it is over 1000 miles.

Bearing in mind what has now been advanced, the reader is in position to see the rise of that marvelous and mysterious flow of waters which, issuing from the Gulf of Mexico with the speed and prowess of a mighty courser, hastens northward with freight more precious than the wealth of the Indies. Its name is the Gulf Stream. The cautious pen of Ansted describes it as "a great and wide stream of heated water, larger than all the rivers of the world together, running in a definite channel through colder water of a different color, so that when a ship enters the stream, in smooth water, one may see the bows dashing the spray from the warm and dark blue waters she is entering, while the stern is still within the pale green and cold waters of the banks of Newfoundland." Clear as is this description, it gives us but a poor idea of the reality. The Gulf Stream, indeed, beggars all efforts at portrayal. To see it rolling in its grandeur is not enough to enable the beholder to understand its wonder or conceive its power. The mind can take these in only when it can weigh and measure those facts and forces which lie concealed below the surface, and over which the

oldest tar may sail all unconscious and unconcerned. Our knowledge of the sea, even in the limited area we are now considering, is by no means perfect or exact. But, after all, we are not shut up to skepticism or imagination. It can not be said, as some seem to think, that we know as little of the great "river in the ocean" as De Soto knew of the Mississippi when he first saw it in its glory. The United States Coast Survey, under its renowned head and director, Lieutenant A. D. Bache, has long since given to the world the nicely-charted results of its arduous and untiring labors in thermometrical and other deep-sea surveys, long protracted in the North Atlantic. These results, compared with others before and since obtained, in the hands of scientific workmen and able interpreters, have been as seed long sown, now ripening, and whose fruit is ready to be gathered. And, just here, it may be well to remark that, in bringing to light the mysteries of the Gulf Stream, if we shall succeed in so doing, the entire system of oceanic circulation, with its wondrous adaptations, is at the same time and necessarily revealed.

As already intimated, the Gulf Stream has been described as a "river in the ocean." Nor is the expression a mere figure of rhetoric. As rivers maintain their marked peculiarities, from their sources to their mouths, so does this majestic flow of waters. The classic Tiber was not more tenacious of its "yellow" sands, nor is the White Nile of its chaste and snowy floods, the Arve of its "gray," nor the Andean Salado of its "brackish" taste, than is the Gulf Stream, in its vast course, of all that characterizes its volume as it bursts forth from its fountain in the Gulf of Mexico. From this point the stream cuts for itself a noble channel in the arc of a great circle, right through the body of the Atlantic Ocean. Turning neither to the right nor to the left, but obeying the unseen and irresistible impulse of the earth's rotation, it sweeps on with a velocity greater than that of the Mississippi, and with a volume more than a thousand times as large. No obstacle, not even the rocky islet, lies in its path for more than twelve hundred miles. The Grand Bank of Newfoundland—a submarine plateau, rising within 100 fathoms of the surface of the ocean—is barely, if at all, grazed by the extreme western skirt of the current. From Newfoundland its track again is clear as far as the boldest and most skillful sailor has ever traced it into the polar basin.

The banks and the bottom of the Gulf Stream are of cold water, but its volume is of warm. As it issues through the Narrows of Bemini its temperature is 86°. But after it has run over a thousand miles to the north it still retains its tropical heat. When her Britannic Majesty's ship, *The Nile*, in May, 1861, sailed from the harbor of Halifax for Bermuda, under Admiral Sir Alexander Milne, that officer, as he entered the Gulf Stream, found the water at the stern of his vessel at a temperature of 40°, while be-

fore her bows the thermometer in the Stream stood at 70° . The heat actually set free in a winter's day by the Gulf Stream is enough to warm up the whole column of atmosphere resting upon France and the British Isles from the freezing-point to summer heat. It would be easy to show that the thermal treasures borne on its bosom to the North Atlantic would be (to use the words of another) "sufficient, if utilized, to keep in constant blast a cyclopean furnace capable of sending forth a stream of molten iron as large in volume as the discharge of the mightiest river." When the southwest winds take up the vesicles of vapor in which these treasures are stored, and waft them to England, the amount of latent heat set free by precipitation overhead in one day is computed to equal that created by the combustion of all the coal consumed in the island annually.* If no more heat was received than is due to the position of the islands in respect of latitude, the mean winter temperature of Shetland would be only 3° , and that of London 17° . According to the observations of the Scottish Meteorological Society, however, the mean winter temperatures of these places are respectively 39° and 37° —Shetland being thus benefited 36° and London 20° . "In Iceland and on the Norwegian coast," we learn from the same high authority, "the increase of heat thus accruing is very much greater." To all such places, along the path of the Gulf Stream, even within the arctic circle, the vast current may be regarded as both a repository and dispenser of the sun's warmth given out in summer, and of the genial and vitalizing forces which clothe equatorial lands with a sea of foliage. So true is this that several of the isochimenes, or lines of equal *winter* temperature, are bent and carried by the Gulf Stream sixteen hundred miles northward of their normal position! This deflection of isochimenes in the northern hemisphere is due to the fact that the Stream makes its warmth felt most sensibly in January, just as the hyperborean flow from the Antarctic Ocean is coldest in July, deflecting the isotherms from their normal position the most in that month. This peculiar distribution of the winter climate of the British Isles, as it becomes known, is brought into requisition by the skillful physician in the treatment of diseases. The patient needing a milder air is no longer sent to the southward, unless directed to the *west* end of the island; and the weak constitution recuperates almost as rapidly at Shetland, or on the west coast of Scotland, as in any part of England, except from the Isle of Wight westward around the Cornish Peninsula. To speak of the early productions of the soil here is almost unnecessary. At Penzance, in Cornwall, the equable character of the English climate is most strikingly developed. Penzance is the garden of the English vegetable markets. Green peas and early potatoes spring out of the ground

in February, and are on the table in May, and every variety of similar vegetable growth at these early dates. Trees and plants, indigenous only to the tropics, often remain in the ground all winter without injury. Oranges, lemons, myrtles, camellias, magnolias, the Mexican agave, require no protection from frost. So that Humboldt spoke of it as "the Montpellier of the North."

But time and space would fail us to accumulate the evidences of the thermal forces and the balmy influences which demonstrate the existence and climatic agency of the Gulf Stream. It clothes Ireland with her robe of "emerald," and England and Western Scotland with verdure. If from its smoky waters the fog rises to hide the rays of the sun, it does for England what the sun, in that latitude, can not do. It fructifies her soil, tempers her skies; it puts renewed vigor into the arms of her brawny mechanics, and gives the bloom to her maidens' cheeks. The Iceman also rejoices in its proximity. And the poor Norwegian, at the North Cape itself, in midwinter, exults in the fact that his harbors are kept open and his shores delivered from the severe tyranny of the Frost King.

The waters of the Gulf Stream are highly colored. As far away from the straits of Florida as the coasts of the Carolinas they are of an indigo-blue. Their line of junction with the surrounding sea can be easily discerned with the naked eye. "Often," it is said, "one half of the vessel may be perceived floating in Gulf Stream water, while the other half is in common water of the sea—so sharp is the line and such the want of affinity between those waters, and such, too, the reluctance, so to speak, on the part of those of the Gulf Stream to mingle with the littoral waters of the sea."

The explanation of this peculiar phenomenon, though important, is difficult. Sir John Herschel contended that it is due to reflection of the sun's light from the sea bottom of great depth, and the deepness of the blue increases, where there is nothing to foul the water, with the depth. Mrs. Somerville states, too, that the reason the Gulf Stream loses its indigo hue near Newfoundland is that the water is shallow. It is said that the light illuminating the Grotto of Capri, in the Bay of Naples, is very blue; so also the color of the water in the Grotto of Vaucluse. The Rhone, it is also said, where it issues from the Lake of Geneva, is intensely blue, its color far surpassing that of the bluest sea. But this interpretation of the indigo hue of the great tropical current seems unsatisfactory. Off the Carolina coasts, where it is bluest, the depth of the ocean is not over a thousand fathoms, while off the Grand Bank of Newfoundland it suddenly falls to a depth of four thousand fathoms—a fact which interferes with Mrs. Somerville's statement. It is hard to see how the facts in the case can be accounted for by Herschel's solution. For we have the edges of the Gulf Stream so sharply defined that the

* Maury's "Physical Geography," p. 48, 3d ed.

green water or cold banks of the stream are visible from a ship's deck. The two bodies of water, the green and the blue, moving side by side, though in opposite directions, have a bottom of the same depth.

The discovery of copper in sea-water has suggested to some that the blueness of the Gulf Stream was due to the presence of cuprate of ammonia. But chemical analysis of sea-water shows that this ingredient enters into it in less

than the proportion of one part in a thousand. The author before quoted, in his "Physical Geography of the Sea," takes the ground that the color of the sea is determined by its saltness. "The salt-makers," he tells us, "are in the habit of judging of the richness of the sea-water in salt by its color—the greener the hue, the fresher the water. At the salt-works of France, and along the shores of the Adriatic, where the "salines" are carried on by the proc-

THE DRIFT OF THE GULF STREAM.

ess of solar evaporation, there is a series of vats or pools, through which the water is passed as it comes from the sea, and is reduced to the briny state. The longer it is exposed to evaporation the saltier it grows, and the deeper is the hue of its blue, until crystallization commences, when the now deep blue water puts on a reddish tint.* This seems consistent with what has, so far, been revealed of the great oceanic currents. The saline theory, as it may be called, proceeds upon the known solar evaporation the hot stream has undergone in the Gulf of Mexico. The great equatorial current of the Atlantic is blue; that of the Pacific, long under the sun, on reaching Japan, is called by the Japanese "Kuro-Siwo"—"The Black Stream." The solution of the problem may be found to differ from all answers that have been yet given. The surface water both in the Indian and Pacific oceans is often highly colored. Patches, red, brown, and white, are found stretching as far as the eye can reach, the water of which, when taken up and carefully examined under the microscope, is found to be full of the animalculæ having the colors in question. Along the shores of the Red Sea a red matter is washed up, which Ehrenberg proved to be of vegetable growth. The same phenomenon occurs in the Yellow Sea, where yellow spots have been found. Captain Kingman, in lat. $8^{\circ} 46'$ S., long. $105^{\circ} 30'$ E., a few years ago passed through a tract of water 23 miles in breadth, and of unknown length, so full of minute *phosphorescent* organisms as to present at night the aspect of "a boundless plain covered with snow." Some of these animals were "serpents" of six inches in length, transparent, of gelatinous film, and highly luminous. These were taken in a fork of the equatorial current of the Pacific. Another sea-captain, in the Gulf Stream, off the coast of Florida, some years ago, fell in with "a school of young sea-nettles," and, bound as he was to England, he was five or six days in sailing through them; sixty days afterward, on his return-trip, he again fell in with them, recognizing them as the same, as, on both occasions, he frequently hauled up bucketfuls and examined them. The Gulf Stream is freighted with these creatures. To use Irving's figure, they appear to be clad "in brilliant coats of mail." They mostly shine when excited by the agitation of the water, or when struck, as by an oar. One of them, more than an inch in length, when thrown down on the deck of a ship, bursts into a glow so strong as to appear like a lump of white-hot iron. In the storm, at midnight, the Gulf Stream, in the mechanical dash of its billows, glares and burns with their fiery radiance, as if it were a sea of flame, and thus obtains the name which has been given it—"The Milky-Way in the Sea."

* "The water of the brine-springs of Cheshire, England, when pumped up is perfectly clear and free from particles in suspension. It is of clear sea-green color."—MUSPRATT'S *Chemistry*, p. 104.

When *the microscope* has done its work with these insects, we believe it will be found that they decide the color of the mighty current. We have dwelt here because, whatever solution shall prevail in the settlement of this question, one thing is established, viz., the individuality and insulation of the Gulf Stream in mid-ocean, and its adaptedness to preserve through its long course those strange qualities which mark and distinguish it from surrounding waters, as if by the brush of an artist "upon a painted ocean."

The eye of the traveler is arrested by no feature of the great "river" in the Atlantic more than by the sharpness of its edges. Its water refuses to mingle with that around it. Wonderful as this is, other streams exhibit the same stubbornness. The red flood of the Missouri and the inky waters of the upper Mississippi are distinguishable for several miles after their confluence. "In the offings of the Balize, sometimes as far out as a hundred miles or more from the land," we are told by the author of the "Physical Geography of the Sea," "puddles or patches of Mississippi water may be observed on the surface of the sea with little or none of its brine mixed with it."

To this antipathy toward mingling with any foreign water, so strikingly evinced and displayed by the Gulf Stream, we must add an all-important fact. Nowhere, so far as we have any reason to believe, does it in any part of its course, unless near or within the arctic basin, come in contact with the solid and highly heat-conducting projections of the earth's crust. The coasts of the United States and the shoals of Nantucket do not, as was once supposed, touch, much less turn it or shape its direction. If, now and then, it is slightly invaded or impinged upon by the polar current coming down at Newfoundland, not even does the Grand Bank itself reach to the Gulf Stream, or rob it of its heat. For the Grand Bank is the haunt of the codfish and other sea life that can not endure warm water, and, coming from higher latitudes, swarm only in their native temperature. The bottom of the bank, too, being two hundred fathoms deep, is *overswept*, if at all approached, by the westernmost and extremely shallow fringe of the stream, in this latitude not over one hundred fathoms deep. It has long been observed, moreover, that the water of the Stream distributes itself in the northern ocean into *layers*, with alternations of warm and cold water. And it is probable, as has been suggested by a great master of hydrography, that this stratification of the aqueous masses assists in protecting the tropical streams of the ocean.

Captain Silas Bent, the authority just referred to, thus explains it: "It is a natural arrangement of waters of different specific gravities; that of the lowest temperature, being the densest, clings to the bottom; the warmest water, from the salt it contains, being next in weight, overlies the first; and then the cool fresh water floats sometimes on the surface (as

Captain Rodgers mentioned to me he had seen it northeast of Behring's Strait), and is carried with and becomes a part of the current immediately underlying it." This arrangement, he thinks, too, a wise provision of nature, by which the warm current is *insulated*, as it were, to prevent the loss of its temperature, while passing to the high latitudes.

Such are some of the more striking lineaments an all-wise God has graved upon this mighty effluent from the torrid zone of the earth. As long since as Anghiera's day and that of Sir H. Gilbert (1523), the Gulf Stream has excited curious inquiry and wonder.* Many have been the attempts to unravel its philosophical mysteries. With greatly increased and increasing light, the subject has not yet been removed from the field of conjecture. Early theorists explained it by assuming that the hot current bursting through the Straits of Florida and bounding northward was due to the discharge of "The Father of Waters" into the Gulf of Mexico. It was contended that the velocity of the Mississippi and the velocity of the great Stream were the same, and that both were sensitive to the same vicissitudes.

Captain Livingston disproved the credibility of this view, by proving that the volume of water emptied into the Gulf was only one three-thousandth part of that running out. Lightly and hastily, however, as this refuted theory has been dismissed, it was countenanced by some remarkable facts which have never received an explanation and scarcely a comment, but which, as we shall presently see, are not to be despised or forgotten.

In place of the hypothesis he had overturned, Livingston substituted one equally, if not more untenable, that the velocity of the Gulf Stream is due to "the motion of the sun in the ecliptic, and the influence he has on the waters of the Atlantic." According to this view, "a sort of yearly tide" was conceived to be "the true parent of the Gulf current." The sun's apparent motion would affect the North Atlantic only—if in such a way at all—for a few months in the year, and could never thus generate a ceaseless and perennial tide, which, as has been beautifully said, "in the severest droughts never fails, and in the mightiest floods never overflows."

About the year 1770 the fertile and untiring brain of Benjamin Franklin, conscious of the magnitude of the subject, and its importance to the fortunes of the colonial commerce, began to busy itself in the study of Atlantic hydrography. He first offered a solution of the problem which bore any marks of plausibility. His opinion was widely repeated, and became deeply rooted in the mind of sea-faring men, and as it is substantially identical with the latest theory advanced—that of Sir John F. W. Herschel—deserves special consideration.

Dr. Franklin maintained that "the Gulf Stream is the escaping of the waters that have

been forced into the Caribbean Sea by the northeast trade-winds, and that it is the pressure of those winds upon the water which drives up into that sea a head, as it were, for this Stream." Whether this be true or not, it is unquestionably well supported by oceanic phenomena. Admiral Smyth, in his work on the Mediterranean, states that a continuance of "*gusty gales*" in the Sea of Tuscany has been known to raise its surface no less than twelve feet above its ordinary level. It is well known that in the Indian Ocean and China Sea the waters are driven alternately backward and forward by the monsoons. It is the southwesterly monsoon that causes inundations in the Ganges, and a tremendous surf on the coast of Coromandel. The historic student will recall those rises in the German Ocean which, created by westerly winds, beat against the dykes of Holland, and which, in the desperate struggle for Netherland liberty, were used by the great William of Orange against the armies of Spain. Nautical annals have recorded one of those fearful storms that sweep over the West Indies, so violent that, as with resistless besom, it arrested the Gulf Stream, forced back its mighty flood, and piled up its waters in the Gulf of Mexico to the height of thirty feet. The ship *Ledbury Snow* gallantly attempted to ride out the hurricane. When it abated she found herself high up on the dry land, and discovered that she had let go her anchors among the tree-tops of Elliott's Key. The Florida Keys, it is said, were inundated many feet, and the scene presented in the Gulf Stream was never surpassed in awful sublimity. "The water thus dammed up rushed out with a frightful velocity against the fury of the gale, producing a sea that beggared description."*

But amidst all such magnificent displays of the power of the winds, the theory advanced first by Franklin, and afterward revived, with a somewhat new dress and under the sanction of his own name, by Sir John Herschel, has never been received as conclusive.

For reasons which we shall presently state, it rests upon a partial induction of the facts known.

A fourth and last explanation of the great phenomenon of the Gulf Stream was offered to the public in 1855, by Lieutenant Matthew F. Maury. Although admitting that "the pressure of the trade-winds may *assist* to give the Gulf Stream its initial velocity," he showed that, for hundreds of miles after it comes out of the Gulf of Mexico and enters the Atlantic, the

* The tropical trade-wind of the Pacific, in which exists one of the greatest of oceanic currents, is first found moving slowly near to the Galapagos Islands, where it produces but a slight effect on the water of the ocean. The Thames, during a strong wind, is raised above its tidal mark. When the wind has for some time blown strongly from Suez, at the head of the Red Sea, it is said that the water of that sea has been forced southward to so great a degree as to leave the bed of the sea almost fordable, though at other times it is deep.—HOPKINS on *Atmospheric Change*, p. 384.

* Humboldt's "Cosmos," vol. i.

great current sets against the trade-winds, and for part of the way runs right in "the wind's eye." He alleged, moreover, that the famous Japan current—"the Gulf Stream of the Pacific"—does the same; and that the vast set of water from the Indian Ocean, known as the Mozambique Current, runs to the south, against the southeast trade-winds, and changes not with the monsoons. Rejecting the hypothesis of Franklin as inconclusive, and as inconsistent with many facts that had come to light since Franklin's views were propounded, he reasoned in this wise: The mean annual fall of rain on the entire surface of the earth is estimated at about five feet. To evaporate water enough annually from the ocean to cover the earth on an average five feet deep with rain is one of the offices of the grand atmospherical machine. This water is evaporated principally from the torrid zone. "Supposing it all to come from thence, we shall have encircling the earth a belt of ocean three thousand miles in breadth, from which this atmosphere evaporates a layer of water annually sixteen feet in depth." Here, then, is a vast equatorial trough or "lake, sixteen feet deep, three thousand miles broad, and twenty-four thousand miles long," ever emptying and ever filling. Evaporation destroys the equilibrium of the sea, and in the endeavor of the water to occupy this enormous space and restore equilibrium, all the waters north and south of this space are set in motion. To this cause of circulation was added the increased specific gravity of equatorial and Gulf of Mexico water, salter and heavier from being longer under the sun than the water of higher and cooler latitudes; which, it was argued, accounted for the northward tendency of the great stream. "The effect of moderate winds, as the trades," said the author, "is to cause what may be called a *drift* of the sea, rather than a current. Drift is confined to surface waters, and the trade-winds of the Atlantic may assist in creating the Gulf Stream by drifting the waters, which have supplied them with vapor, into the Caribbean Sea. But, admit never so much of the water which the trade-winds have played upon to be drifted into the Caribbean Sea, what should make it flow thence, with the Gulf Stream, to the shores of Europe? It is because of the difference in the specific gravity of sea-water in an intertropical sea on one side, as compared with the specific gravity of water in northern seas and frozen oceans on the other, that they so flow." In a word, whatever alters the specific gravity of the sea, whether the temperature, or evaporation, or the tiny secretion of the myriad hosts of sea-shells, is a *current-producing agent*.

We have already intimated that the philosophy of the Gulf Stream involves the elucidation of all oceanic currents, and we beg the reader, therefore, to bear with us as we consider these antagonistic theories. The time has come when the interests of science, navigation, and commerce demand that this whole question

shall be transferred from the region of theory into that of certitude.

Rightly to estimate and appreciate the circulation of the Atlantic, or of any ocean, we must obtain some notion of its bed, and also of its littoral outline. The Atlantic must be conceived of as a vast channel, or, as geographers often name it, "The Atlantic Canal." The opposite shores of this ocean, in both hemispheres, appear to have once been in adherence, but by some grand subterranean upheaval to have been rent asunder, and in the open gap the ocean water rushed in.

The *bottom* of the Atlantic greatly affects the movement and circulation of its waters, and especially of the Gulf Stream. Extending from the arctic circle to the icy barrier that girds the antarctic continent, its length is 140 degrees of latitude, or nearly 10,000 miles; and its width, between the two great continents it laves, varies from 800 miles (between Greenland and Norway) to 1500 miles (between Brazil and Sierra Leone), and, at its widest part, 3600 miles (between Florida and the shores of Africa). It is therefore an irregular, elongated valley. It is over the diagonal of this valley that the Gulf Stream is projected.

The sub-basins of the Atlantic have been very distinctly traced. The elevated rim of its northern basin has been thus ably defined and delineated by Ansted:

"Starting from Iceland on the east side, and proceeding southward, we find the Faroe Islands, the mountains of Scotland, Wales, and France, the Western Pyrenees, the coast of Portugal and Spain, the Atlas, and the Azores. From this point a multiplicity of shoals and banks, crossing the ocean and terminating with the great bank of Newfoundland, form a depressed rim. In this way we find an almost continuous chain of mountain land, either sub-aerial or submarine, reaching finally to Greenland and returning to Iceland. This forms the Northern Atlantic basin.*

The central basin of the stormy ocean is equally as well marked as the northern. Beginning with the submarine mountains off Newfoundland, running to the Azores, and thence through Madeira to the Canaries and the Cape Verds, and thence westward, we pass by the island of Fernando de Noronha to Cape St. Roque.

The floor of the Atlantic, as determined by deep soundings, consists of a series of descending steps. Wide-extended and flat terraces stretch out beyond the present shores, and are succeeded by steep cliffs dropping down nine thousand feet. For the distance of two hundred and thirty miles from the coast of Ireland there is a slope of about six feet in a mile, or twelve inches in a thousand feet. In the next twenty miles there is a sudden descent of nine thousand feet, after which, for twelve hundred miles, all the bottom is nearly level. This is the

* Ansted's "Physical Geography," p. 129.

celebrated telegraphic plateau. By a succession of drops we finally reach the greatest depths of the Atlantic, at least *thirty thousand feet*, which, on the American side of the ocean, is some distance south of the great bank of Newfoundland.

We are now on vantage-ground from which to survey the whole field of discussion before us; and we are in possession of facts which, rightly read, unravel much of the mystery still clinging to the Gulf Stream and Atlantic circulation. Livingston's theory, we have already seen, is to be rejected, because it explains a phenomenon of ceaseless and perennial continuance by a cause which acts efficiently, if it acts at all, only for a part of the year, and then is withdrawn. Happily, we think, for the cause of science, we are reduced to a choice of the two remaining hypotheses—the Franklin-Herschel theory, and that of Maury. Of these two it is impossible to form any combination. It is impossible to reconcile them. "The dynamics of the Gulf Stream," says Herschel, "have of late, in the work of Lieutenant Maury, already mentioned, been made a subject of much (we can not but think misplaced) wonder, as if there could be any possible ground for doubting that it owes its origin *entirely* to the trade-winds."

Let us put this to the test.

The trade-winds of the northern hemisphere, in both the Atlantic and Pacific oceans, commence to blow from the tropic of Cancer, and reach the equatorial zone from the northeast, at an angle with the equator of 24° . The "trade-wind belt," or the terrestrial girdle, swept by these air-currents so ceaselessly, is three thousand miles broad, extending to 23° north latitude, and to a still lower southern latitude. But this belt is not stationary.* It is obedient to the apparent motion of the sun, and moves and vibrates up and down on the earth's surface, as the sun declines to either side of "the line." When he shines vertically on Cancer (June 21), the trade-wind belt is shifted nearly eight hundred miles to the north. When, again, he is vertical to the tropic of Capricorn (December 21), the southern edge of the belt is eight hundred miles south of Capricorn. At the equinoxes, of course, the sun being directly overhead at the equator, the belt is commensurate with the intra-tropical regions, transgressing them neither toward the North Pole nor toward the South Pole. Without discussing the theories of the trade-winds, *these* are the agents on which Franklin and Herschel rely for their Gulf Stream theory. According to Maury's theory the Gulf Stream may derive its "initial velocity" from the trade-winds; but it rejects the Herschelian statement that, "if there

were no atmosphere, there would be no Gulf Stream, or any other considerable oceanic current whatever."*

We have already seen that the main equatorial current of the Atlantic is a considerable one, and likewise that of the Pacific. But it is impossible to account for either of these tremendous streams which flow from east to west (as Columbus so long ago pointed out) by evaporation, temperature, or difference in specific gravity. However these forces may come into play in the production of the Gulf current, they can never be assigned as the dynamical agents for the equatorial current. If it should be urged against Herschel's view that the waters of the Gulf of Mexico, from being longer under the sun, are heavier than the waters in the East Atlantic, then it would follow that the equatorial current ought to flow from west to east, just contrary to its known course. Were there, however, no atmosphere, the axial revolution of the earth would never cause the ocean surface any friction with surrounding matter. But the moment the globe began to revolve in its atmospheric envelope, the fluid and mobile particles of the sea, impinging on the air, suffered reaction, and began to flow westward, as we now find. The waters which flow *equator-ward* along the shores of Senegambia, in which the equatorial current of the Atlantic has its genesis, may have a westwardly motion from the same force which guides the trade-wind to the west; but, at the very utmost, this could only avail until these waters have reached the equator. There the circumferential velocity of the earth is greatest, and the westwardly set would be stopped, were there no other powers and forces to urge it on toward the Antilles. The trade-winds are, therefore, the only agencies which can supply this perpetual motion to the equatorial current. And *this much* must be conceded to Herschel's doctrine; but no more. Not to reiterate what has been already advanced against it, we vainly demand of it to meet known facts. In the dead of winter, for instance, when the trade-wind belt is removed mostly below the equator, certainly below the tropic of Cancer, how is it that the Gulf Stream, in unabated majesty, and with undiminished volume, ceases not to issue from the Gulf of Mexico? How is it that, even then, it forces its way beyond the tropic of Cancer, beyond the British Isles, and far within the arctic circle, keeping the harbor of Hammerfest, near the North Cape, free of ice?

More than this, in the summer, when the Gulf Stream's velocity is greatest, and while it is rushing through the Straits of Florida in its greatest volume, the trade-winds in the East and Middle Atlantic receive a serious check and drawback. Then it is the Desert of Sahara drinks in the fiery rays of the sun. The air over its vast area is heated, and rises toward the clouds in columnar masses. Beneath, a vacuum is created; and from all sides of the

* Columbus first fell in with the trade-winds on September 14, 1492, just after leaving the islands of Ferro and Gomera in the Canaries, latitude 28° north. He would have met them several hundred miles further north had he passed on the meridian of the Canaries two months earlier. The trades in September have receded with the declination of the sun.

* Herschel, Art. 37, "Physical Geography," 8th ed. Encyclopedia Britannica.

arid and blazing waste there is an in-draught of air. The *monsoons*, in a word, are now prevailing. The trade-winds, which propel the waters of the sea into the equatorial current, are overmatched by the counteracting monsoons. So mighty are the influences of these periodical winds that even those formed on the deserts of Arabia have been distinctly tracked into Austria and other parts of Europe. The monsoons of the Indian Ocean, so famous, are of six months' duration in the year, and sweep a sea zone more than two thousand miles broad. The effect of the sun's heat on the great Desert of Sahara and the sun-burnt shores of Africa is to turn back and divert the trades of the Eastern Atlantic. And this monsoon influence extends out to sea over a thousand miles! If it were possible to settle questions such as the one before us by the simple *inprimatur* of great and honored names, like Herschel's, we should not have ventured to challenge his theory, or test it with the opinions of others, far less with our own reasoning.

Exception may possibly be taken to the statement that Herschel's and Franklin's theories are substantially the same. We are not unaware that the English philosopher, in accounting for the Gulf Stream or other ocean current, thinks it not essential for him to assume or prove the existence of what is called "a head of water." He very justly remarks: "A circulation in a closed area, produced by an impulse acting horizontally on the surface water, may perfectly well coexist with a truly level course of each molecule." What *may be* and what *is* are two very different matters. Dismissing all opposing views with an assertion of his own opinion, Herschel has not hereby increased his scientific fame. He suggests no reconciliation between his theory and the many known phenomena at war with its assumptions. In truth, his hypothesis was defunct when he espoused it, and it has been as much as even his great name could do to galvanize it into a transient, unnatural vitality. What, then, are

THE FORCES GENERATING THE GULF STREAM?

First, it seems clear that the *initial velocity* is given by the momentum of the equatorial current, flowing westward under the impact of the trade-winds. This is but feeble, and would soon be spent. A second cause is the *difference in specific gravity of the equatorial water and the polar water*. This is equally true of the waters of the Gulf of Mexico and the Baltic Sea. The density of the Baltic is:

Highest yet recorded.....	1.0232
Lowest.....	1.0003
Average of the West Baltic.....	1.0112
Average of the East Baltic.....	1.0042

The average density of the waters of the Atlantic is considerably higher than of these frigid yet lighter seas. The specific gravity of the Atlantic is, for the average, 1.0266. The heavy waters of the Gulf of Mexico, as we shall soon

see, above the average Atlantic density, by a law of hydrostatics, would seek an exchange with the lighter, though icy, waters of the Baltic, were there no other point of the sea with which they might change place. But if we compare the specific gravity of Gulf Stream water with that of Arctic Ocean water, we perceive that, besides the Baltic, the vast polar basin itself offers to the mass of equatorial water a hydrostatical inducement that will take no denial. "The mean specific gravity of the Arctic Ocean water" (according to the long-continued and elaborate experiments of Commander Rodgers), "reduced to the freezing-point (27.2° Fahrenheit) of sea-water, was 1.0263. The specific gravity of the Gulf Stream water, reduced to the same temperature (27.2°), was 1.0303. If these be taken as specimens of the water of torrid and frigid zones, it would appear that the waters of intertropical seas have fifteen per cent. more salt in them than the surface water of the Arctic Ocean has."* The specific gravity of the Gulf Stream water on the thirty-fourth parallel of north latitude is found to be *thirty* per cent. heavier than the sea-water along the American coasts, which is cold, and in every way marked as an effluent from the arctic.

But Rodgers, in his experiment, by reducing the polar water to a low temperature (27.2° Fahrenheit), chilled it far below the degree at which he found it, which, in latitude 72° 2' north, was nearly 48° in temperature by the thermometer. This, of course, would somewhat affect the inference to be drawn theoretically from what has been said. In his investigations north of Behring's Strait, in 1855, he found that, in point of fact, the water was in layers, alternating with warm, cool, and hot, and he thus labels these layers: "*Warm and light water on the top*," "*cool in the middle*," but "*hot and heavy at the bottom*."

The temperature of the sea near Scotland, according to Alexander Buchan, off the Orkney Islands, is 48.8° Fahr.; off the Shetland Islands is 48.4° Fahr.; mouth of the Firth of Forth is 47.8° Fahr. The Gulf Stream water which passes the Orkney Islands, giving them the mild winter alluded to by Sir Walter Scott, has *ascended* from the ocean floor many hundred feet since it left its fountain in the Gulf of Mexico. For Lieutenant Bache found, "off Cape Florida, about 12 nautical miles east from the light-house, at the depth of 450 fathoms, the temperature was forty-nine degrees Fahrenheit, in June, 1852." (See Bache's "Notes on Gulf Stream.") Beneath this depth the thermometer suddenly fell to 35°! The reason, of course, was that the banks and bed of the Gulf Stream are here of cold water. If it be asked, Why does the Gulf Stream remain on top? we answer: *While in the polar basin*, the water which moved as a surface and ice-bearing current to the south, along the shores of Greenland

* Consult "The Physical Geography of the Sea," p. 207, 225, and 226.

and Newfoundland, was *lighter than the equatorial water*. On its passage, by mingling with the northward flowing water (both surface and undercurrent), it is every hour becoming salter and salter, and hence heavier and heavier. On reaching the banks of Newfoundland, this ice-bearing and berg-drifting flow, meets the tropical and salty waters from the Gulf and equator, and from them obtains the salt to give to its chilly mass a superior specific gravity. Before meeting the equatorial water, that from the pole lacked specific gravity or density. Robbing the hot water of its salt, and thus becoming the heavier body, it drops down to the sea-bottom, and underruns the warm water all the way to the shores of Cuba, where it is found at great depths, and known by its icy temperature of 35° ! We have not commented upon the "*cold water bed*," and the "*banks of cold water*," which form the channel for the great equatorial or Gulf current. The reader will see that no constant stream can move *into* the polar basin without keeping it in ceaseless motion, and forcing an equal body of water *out* of it. This, of course, takes place in both hemispheres, and the *refluents* from the two poles conspire in keeping up the oceanic circulation. Could a sea-wall, however, be built of solid masonry, connecting Cape Horn and the Cape of Good Hope, and another be built in the Arctic Ocean, thus cutting off the Atlantic from all polar communication, the present system of currents would be only modified, not destroyed. For, the weight of the hot seas exceeding that of the cold, the forces of hydrostatical equilibrium would come into play. This physical law has been beautifully likened to a *MAGICIAN IN THE SEA*. Standing midway between the pole and the equator, he strikes first the hot water and then the cold with his wand. The hot water going to the pole and the counter-stream going to the equator feel and obey the stroke, and thus for ages have kept up their ceaseless circulation and their perennial fullness.

Another co-operative agency in sustaining the movement of the stream is

"THE BONNY WEST WINDS."

After passing to the north of the trade-wind belt, in latitude 24° north, the volume of the Gulf Stream receives a *new* impetus from the drifting impact of the southwest and the famous "*bonny west winds*." These, for nine days in every twelve, blow steadily over the North Atlantic, and sweep its waters, in a surface movement, toward the British Isles and Northwestern Europe. These winds have descended from the upper regions of the atmosphere in the torrid zone, and are the antitrades, which, according to Kane's observations, largely prevail even into the polar basin. If, as we have seen, the trade-winds were the efficient cause of the equatorial current (though not of the Gulf Stream), it is very clear the antitrades, which, by a law of meteorology, must just equal their counter-current—we say, it is clear the

antitrades (were they to blow as steadily as the trades) must impel northward and eastward the whole mass of Gulf water, and any other with it, with the same force the trades give to the equatorial water. Did the antitrades blow due north, the shores of Greenland and Iceland would bloom and blossom with the flora of the Antilles. But these winds deflect the vast equatorial flow somewhat to the east, and cause it to trend toward the shores of Norway. But the stream is not turned away from its course, because it is moving in obedience to other calls more potential than wind. It uses the wind as a servant, and not as a master. Like the noble ship, whose course is at right-angles to the breeze which is received on her quarter, the equatorial Gulf water curves gracefully toward the track charted out for it by the Lawgiver of hydrostatics.

Such are, we believe, the forces which alone can be enumerated as propelling the equatorial Gulf mass into the polar receptacle.

There are other forces at work, no doubt, in assisting and accelerating this flow of hot water and in promoting oceanic circulation. The tiny sea-shell and the swarming myriads of the deep play an important part. The vast floods of fresh water from the grand river systems of America are factors in the result. The storms of the Atlantic, which are traced in numbers to the Gulf Stream flow, conspire to hasten its movement and swell its volume. The Stream is called by sailors "*The Weather-Breeder*"—a doubtful appellation. Its path is, indeed, fearfully visited by the terrors of the deep. "Storms, squalls, hurricanes, water-spouts, lightning and thunder," in the words of R. H. Dana, "give continual and terrific variety to this stupendous ocean current. Truly it is grand, in the deep silence of midnight, to pace the deck and listen to the roaring noise of the Gulf Stream as it travels on its ceaseless course." Along its way the caverns of the deep are doubtless thickly strewn with the wrecks of ages. But not from any agency of its own, and rather because the storms of the Atlantic seem to love this highway. Mr. Espy has shown that the storms of the United States, and "even those which arise in the Mississippi Valley, travel east, and often march out to sea to join the Gulf Stream." The Smithsonian Institute has mapped one of the latter, which, beginning at Galveston, Texas, after a long circuit by the Lakes, finally joined the favorite Stream by way of Nova Scotia.* These occasional phenomena ought to be reckoned among the causes of the Gulf Stream—volume and velocity—but not of its genesis or its perpetual circuit.

IS THE GULF STREAM CRADLED OVER A VOLCANO?

We have seen that all the way from the coasts of Africa the water which feeds the ever-flowing fountain of the Gulf Stream has been

* See the *Bureau* (Chicago) for January, 1870.

under the fiery blaze of an equatorial sun. It is highly probable that, after reaching the Gulf of Mexico, this water receives a vast quantity of heat from a *subterranean furnace*. The vast plateau or Mexican table-land is rent by a most singular crevice, through which the internal fire of the earth finds vent. From the Gulf to the Pacific Ocean stretches this fissure, in a line about sixteen miles south of the city of Mexico. Along this parallel rises a long row of active volcanoes, conspicuous among them Orizaba, with its ever-fiery crater, "seen like a star in the darkness of the night," Popocatepetl, Tuxtla, Toluca, and Iztaccihuatl, forming a volcanic circus around the city of the Montezumas. Not far off is the volcanic cone of Jorullo, which suddenly appeared and rose on the night of September 29, 1759, to the height of 1683 feet above the plain. This is only one out of six mountains that have been thrown up in this region by plutonic forces since the middle of the last century. It has, therefore, suggested itself to geographers that the vast basin of the Mexican Gulf, in many places of very great depth, reposes upon a seething mass of volcanic fires. We can not now stop to consider this at length, but are loth to pass it by. The subject is so full of interest, and bears so powerfully upon the hydrostatic theory of the Gulf Stream, that we venture to press it upon the reader by the following beautiful and forceful passage from the work of Mangin, whose "Mysteries of the Ocean" is so universally admired:

"The solar heat, undoubtedly, does not act alone upon this caldron of the Mexican Gulf, which is every where surrounded with coasts and islands bristling with semi-extinct craters, still agitated by frequent earthquakes, and betraying to the careful observer the glowing furnace seething beneath the waves.

"Who knows but that it is to the operation of the submarine fires that the Gulf Stream, sprung from this estuary, owes the force of irresistible expansion, closely analogous to the detention of vapor, which enables it to force a passage through the mass of waters even to the arctic circle?

"Who knows but that it draws from this same furnace the enormous provision of heat which it lavishes on its circumference (*parcours*), and enough of which remains in the end to melt the ices of the polar sea? At all events, it is curious to see another, and nearly as powerful a current, starting from that point of our hemisphere whose meteorological and geological conditions are nearly the same as those of the Gulf of Mexico. I refer to that other great artery of warm salt-water which rises in the Bay of Bengal, in the centre of another circle of fire, and on a bed which the internal convulsions of the globe have besprinkled with volcanic islands."*

Almost at the moment of writing these words (February 19), the telegraph announces an

earthquake at San Francisco, "coming from the southeast"—the very quarter in which lie buried the cyclopean furnaces described. Late disturbances around the mouths of the Mississippi and the sudden elevation and agitation of waters in the Bayou Plaquemine, two years ago, confirm what is here advanced.*

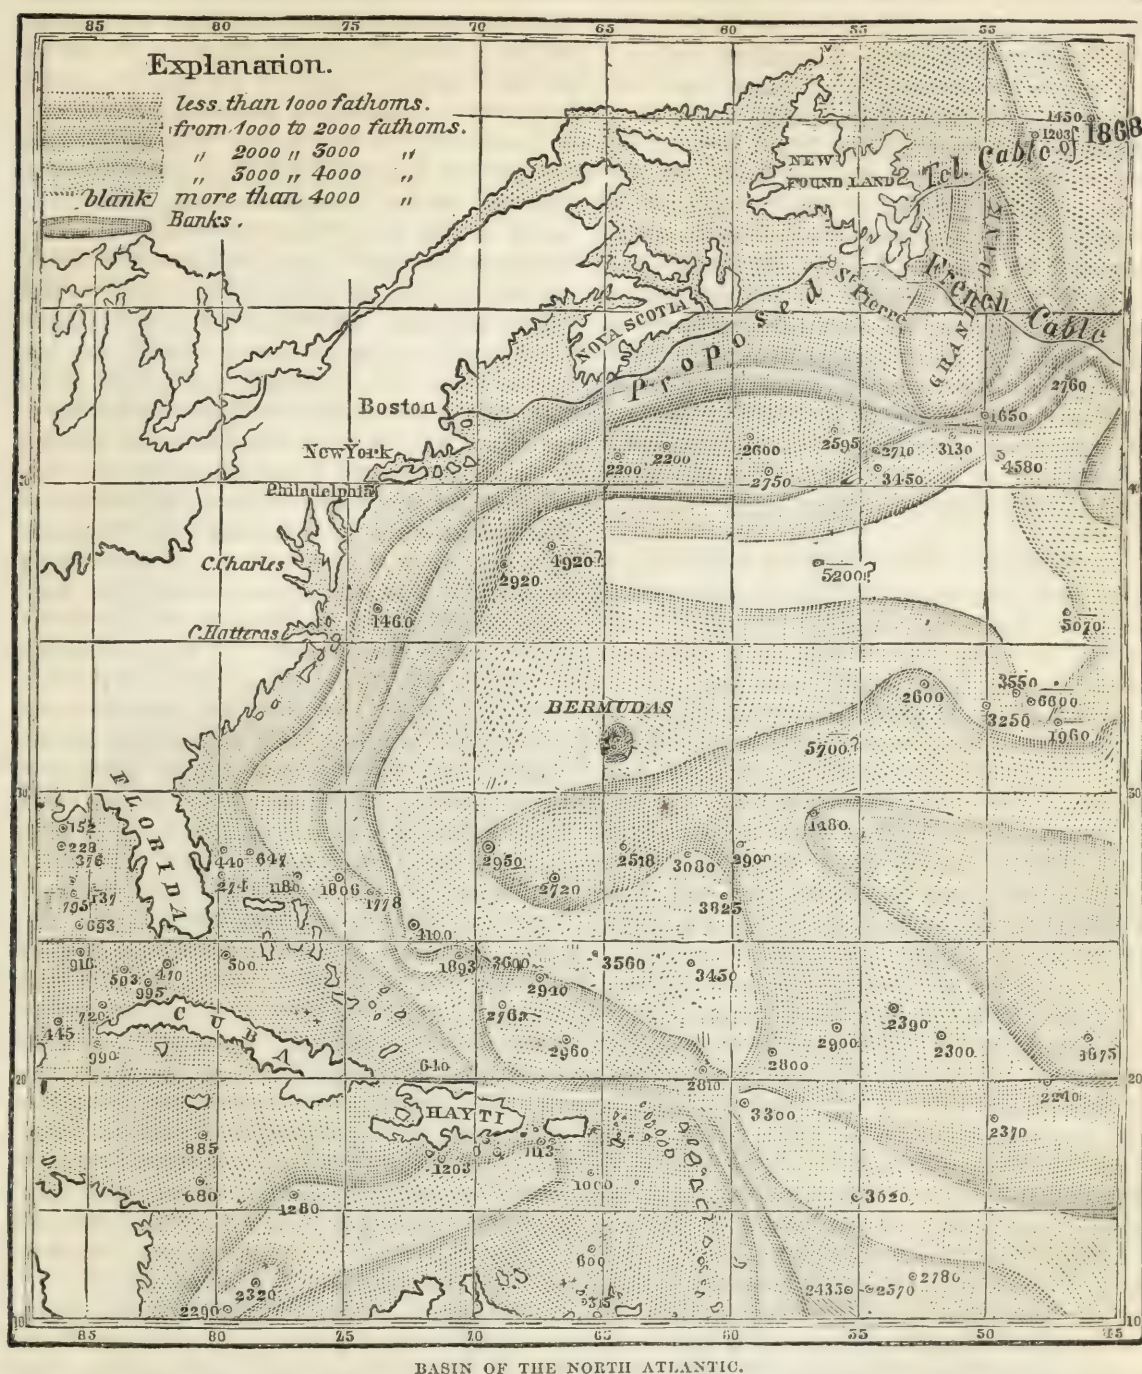

Two points in the discussion of the subject remain to be considered. But they are paramount, and, we believe, of novel interest and importance. One of these is

THE RECURVATION.

Our maps and charts frequently give to the "blue," tepid stream a decided easterly, and afterward southerly, curve from the Nantucket Shoals and the Grand Banks of Newfoundland toward the Azores. That there is a movement of the water giving an appearance of truth to this idea is not to be questioned. The Sargasso Sea of Columbus, "the centre of whirl," as in the eddy, to use a popular expression, fully attests the rotation of waters in the Atlantic; and it is plain the Gulf Stream must furnish a share of the revolving tide. But we are not to mistake a drift by the antitrade-winds, however wide, for the mass which makes the Gulf Stream. It follows as a corollary from the true doctrine of the Gulf Stream formation that it can never pause or turn aside in its course till it has obeyed the hydrostatic call from the polar basin. It is restless till it rests there. The recurvation toward the Azores is necessarily a mere drift—a *pellicle of water*. Could this be skimmed from the surface, we should see, beneath, the onward-flowing mass of tropical water, rushing, in undisturbed and unruffled majesty and grandeur, toward its northern and arctic goal. Every observer has noted how the stream widens after passing the Carolina coasts, and it is always argued that the volume is the same that issued through the Narrows of Bemini, but has only become thinner.

* Hopkins, a distinguished writer on this subject, thus argues: "The distance of the equatorial surface of the ocean from the centre of gravity is, say, about thirteen miles more than that of the polar surface, and, were gravity the only force that was constantly in action, the water of the equator, notwithstanding any influence of wind, would run down to the poles, just as water will ordinarily run down a hill. But this is prevented by centrifugal force, which, to a certain extent, counteracts the attraction of gravitation; and the natural level of the water of the ocean in every latitude, when undisturbed by wind, is determined partly by both gravity and centrifugal force." The centrifugal force of the earth, however, compared with the force of gravity, is as 1 to 289. Before the centrifugal force could equal the force of gravity, the earth would have to increase its rotative velocity 17 times. (See Smith's *Mechanics*.) If, then, the equatorial water is moved toward the poles by gravity, it has a fall of 12 miles in 8000. The Amazon River only falls 12 feet in the last 700 miles of its course; and the La Plata 11 feet in 400 miles. The reader can apply these figures for himself. He can easily see that the trade-winds, blowing from the tropics toward the equator, alone serve to prevent the equatorial waters from rushing toward the poles in torrential velocity. But the wind can not reach the deep sea, and hence can not retard the unseen and submarine flow of the water.

* "Mysteries of the Ocean," p. 110.

There are many reasons for rejecting this view, which, we believe, is the universally accepted notion. A single but sufficient one is the volume of water which unites with the Gulf Stream some time after it leaves Cape Florida. There, too, its depth is not more than 370 fathoms in some places, according to Lieutenant Bache, who, in his Report of the Coast Survey (1855), states: "The existence of the water of the polar current below those of the Gulf Stream was established by Lieutenant-Commanding Craven, who found the temperature of surface water at 82° , but in 370 fathoms he found it to be *but two degrees*, of Fahrenheit's scale, above the freezing-point of fresh water (34°), p. 6. But elsewhere, by the same authority (1852), he fixes the depth of the stream on the Charleston section at from three hundred to five hundred fathoms!"

Thus it seems, in flowing from the Gulf to Charleston, it has not only widened but deepened its bed! Off Hatteras, at 525 fathoms, the temperature was only 54° !

We adduce these facts to show that the surface flow or drift, in the recurvation, is no test or index of the true course of the current itself. To ascertain this, we must *feel* to the bottom of the warm set and discover the cold-water channel (over which it moves) with the bulb of the thermometer. It may be well for the navigator to know every eddy and drift of the sea; but the thermometer only can reveal the hidden mechanism and wheel-work beneath the waves. Meantime the physical law of hydrostatics which gives birth to the great current must be allowed to be the decisive and controlling shaper of its course.

The phenomenon of the Sargasso Sea by no

means proves a recurvation of the Gulf Stream. This weedy sea shoots its fibres down deep into the ocean. "In some cases," says Fay, "the stems are 800 feet long and nearly a foot in diameter. The weed is not always floating, but sometimes grows up from a submarine plateau." This vegetation evidently rests in a circle of comparative tranquillity; but it is by no means necessary to suppose, as some have done, that it marks a centre around which every portion of the North Atlantic must revolve. The slightest rotation of surface water around it would fully explain its stationary character, especially when we reflect on the great length of its stems shooting down to great depths, and occasionally serving, with its roots, to anchor the swimming field securely in its position.

THE TOTAL GULF STREAM VOLUME

is the most important problem for geographical science now to solve. Little or no attention has been given to its solution, save only to determine the mass of water running through the Florida pass. Vast as this is, and sufficient to form a thousand such rivers as the Mississippi at New Orleans, it is but a part, and the smaller part, of the true Gulf Stream, as that tropical current is recognized on its way to Europe. It seems strange that those who have refuted so ably the Franklin and Herschel theory, and who argue that the issue from the Gulf of Mexico is caused by evaporation of equatorial waters and the consequent alteration of specific gravity by the salt, should never have suggested that other masses of equatorial water (besides those in the Gulf of Mexico) would obey hydrostatic laws and seek to preserve equilibrium with the polar seas.

Reasoning upon the facts now adduced, the writer of this article has been led to the conviction that the Gulf Stream proper has scarcely gotten beyond the coasts of Carolina when it receives an enormous accession of tropical water. It seemed to him unaccountable that the vaster flow of the main equatorial current, which moves from the shores of Africa in an ever-widening sheet, should, when arrested by the Antilles, send off no tributary to the majestic current from the Gulf of Mexico. It is clear that the trade-winds can alone generate and keep in perpetual flow the equatorial or westerly current. But their force can not extend to great depths beneath the surface of the sea; and hence this current can not be so deep as if it were set in motion, like the Gulf Stream, by the force of specific gravity. The force of the winds would be comparatively superficial; but the forces of specific gravity would be both superficial and submarine. It is, therefore, not inconceivable that, while the broad equatorial current is rolling to the west as a *surface flow*, there is another and mighty mass moving beneath it, to the northwest, as an *undercurrent*. The Gulf of Mexico has been compared to a "boiler" or "caldron," in which the water has been evaporated by the sun and become heavy enough to force its way out in

search of lighter water. But may not this figure be extended, as Dové did extend it, to apply to the whole equatorial sea-basin? As the equatorial surface water gets warmer and saltier it sinks by its weight, and thus drops down beneath the line at which the trade-winds can affect its motion. In other words, as it grows heavy it falls out of the westward set of the equatorial current. It is no longer under any constraint, save that which the law of hydrostatics imposes. Having a high specific gravity, there is no reason why it should not, just as the Gulf Stream proper, and acting under the same impulse, move to higher latitudes in search of lighter and interchangeable masses. Seen or unseen, we know, as surely and certainly as we know that the tropical sun is hot, that some such movement must take place, and take place on a grand scale; and we might show that this movement, sooner or later, must conspire and fall in with the movement of the Gulf Stream itself. Let us see what this movement is. Were the globe in a state of quiescence, and had no daily revolution on its axis, the entire volume of the Gulf Stream would, after leaving Florida, run nearly due north, laving the eastern shores of our continent. But experience and observation show that its course is otherwise. The axis of the Gulf Stream is found, by actual measurement, to lie 80 statute miles from Charleston. The American shore, north of Charleston, projecting, the axis is 50 miles from Cape Hatteras, 210 miles from Sandy Hook, and 240 miles from Nantucket—though the warm water reaches nearer the shore, on an average 50 miles. And thus the Stream, which ran near the Everglades of Florida, on the 80th meridian of west longitude, has, before reaching Newfoundland, obtained an easting of more than twenty-five degrees. This is not due to its being deflected by the coasts, nor yet even by any shoals or sand-banks whatever. If we except the surface influence of the antitrades, already alluded to—winds blowing from the southwest—this easting of the Stream water is due solely to the earth's rotation. Every thing upon the surface of the globe at the equator is carried toward the east, at the rate of about 69 miles in four minutes. But if we recede to the north or south of this line the eastern velocity is so diminished that at the latitude of 60° it is reduced to one-half, and at 82° it is reduced to one-eighth of its original amount. The rotative velocity to the east, of an object on the equator, is $\frac{5}{18}$ of a mile per second, and 1000 miles per hour. It is easy, therefore, to see that, as equatorial water having an easterly velocity so great is borne to higher latitudes where the velocity is less, it will trend to the east. The drift-wood and floating sea-weed are found, therefore, on the European side of the Gulf Stream. The bamboos, the relics of carved wood and trunks of trees, conveyed to the islands of Fayal, Flores, and Corvo, contributed to the discovery of America by confirming Chris-

VERTICAL SECTION OF THE NORTH ATLANTIC.

topher Columbus in his belief of "the existence of Western Indies on the other side of the Atlantic." If we take the illustration of a railroad in our hemisphere, running north and south, we may understand this easterly drift. It is said to be a well-known fact to engineers that when the cars are going north the tendency, at great speed, is to run off on the east side; but when the train is going south the tendency is to run off on the west side, *i. e.*, always on the right-hand side. By the same law the debris and drift on the Mississippi are said to seek the right bank of the river. The effect of the

earth's diurnal rotation is, too, universally admitted to give the westerly direction to the northeast trades in the northern hemisphere (blowing from Cancer to the equator), and also the direction of the southeast trades in the southern hemisphere.

The Gulf Stream issues from its source in the Gulf of Mexico through the Bahama Channel. For a few miles it moves nearly north. Current-bottles have been found on the east coast of Florida which had been thrown from ships cruising in the Gulf of Mexico. One of these from the steamer *Walker*, of the United

States navy, cast overboard in the longitude of Mobile Bay, and in the latitude of the Pass à l'Outre, at the mouth of the Mississippi, was found just south of Mosquito Inlet; and another, from the steamer *Corwin*, east-northeast from Cape Florida Light, was picked up on the beach near Jupiter Inlet. But from Bemini the course of the current describes the path of a trajectory. The water, which at first was moving eastward with the earth, at the rate of nearly 800 miles an hour, is every moment coming to latitude of *less* easterly motion, and hence it falls to the east. And thus the whole mass is moving on a *fixed mathematical line*, and according to the *resultant* of the two forces which act upon it. "Like every agent employed by nature," says Felix Julien, in his "*Les Harmonies de la Mer*," "it has a mission to fulfill, an important rôle to discharge. Nothing, therefore, can divert it from its intended aim. Its route is unchangeable; it is traced beforehand, and as precisely and clearly indicated as the elliptic orbit which our planet describes around its central star. Like heat, light, electricity—in a word, like all fluids in motion which no obstacle arrests—the waters of the Gulf Stream follow the shortest line which they can trace from the place of their birth to the allotted limit of their career. On our globe, as every body knows, the shortest distance between two given points is the arc of a great circle; such a curve is exactly described by the great current which issues from the Bahamas, links Newfoundland to the British Isles, and proceeds, while turning round to the north of Western Europe, to lose itself in the polar regions."

Through this apparent digression we hope to usher the reader into the clear sunshine of observed and unquestioned fact. It has been proved that the Gulf waters and all the equatorial sea is acted upon by two classes of force. 1. The forces which are set in play by solar radiation, evaporation, and inequality of temperature in different latitudes. 2. The easterly momentum of the water from diurnal rotation of the earth. *How far are these forces effective?* The notion has long prevailed that the current which passes out through the Florida pass corresponds to the portion of the great equatorial current which passes into the Gulf of Mexico, between the West Indian Islands and the peninsula of Yucatan. But we have seen already how the Antilles meet and resist the equatorial current, and, especially, how the Windward Islands stand out in bold and *crescent-shaped* opposition, like immense barriers, forty-seven in number, just athwart the path of the great westward flow, diverting its tepid mass toward the northwest. The water thus diverted, if obedient to hydrostatic law, must inevitably find its way outside of the West Indian Archipelago, and thus join the other portion—which, having run the gauntlet of the islands, has in the mean time made the circuit of the Gulf—after it issues from the Florida and Bemini straits. The width of this off-

shoot very greatly exceeds that of the Bemini current or the Gulf Stream proper. We say the Gulf Stream proper, although future explorations may show this to be a misnomer, and may demonstrate that if the larger mass is entitled to give name to the current, what is now known as the Gulf Stream shall be or ought to be denominated *The Antilles Current*. A study of the subject, we are convinced, will fix and settle the existence of such a northerly flow beyond a doubt. We believe it can be proved that such a mass of equatorial water, *equal to the issue at Bemini, both in volume and velocity, moves to the northwest and enters the latter as a coefficient power*. Although this question seems never to have entered into the investigations of navigators and hydrographers, they have occasionally rendered, unconsciously, testimony which goes far to determine it. On his large physical chart of the Atlantic, Alexander Keith Johnston has recorded, "North-west branch of equatorial current of Atlantic: extends frequently to latitude 20° north, sometimes to the polar limits of the northeast trade-winds." The longitude on this chart for this branch current is between the 30th and 45th meridians west of Greenwich; and its breadth is given as six hundred miles—*fully fifteen times as broad as the Gulf current at Bemini*. (Keith Johnston. Plate XII. "Physical Atlas.") The same representation is made on the large and beautiful chart of the world (Mercator's) of Berghaus, published at Gotha. These two authorities would, if unsupported, give credibility to the view now presented.

Another evidence that the Bemini or Florida stream receives an immense acquisition on its way to Newfoundland is furnished by the deep-sea soundings of the United States Coast Survey. On its emergence from the Gulf of Mexico it has a breadth of fourteen leagues (42 miles) and a depth of two thousand feet. As it flows beyond the Bahamas it grows wider and wider, and if it received no affluent it should, as it expands in surface, diminish in depth. This is not found to be the case. It both *widens and deepens*! Here we have Lieutenant Bache's figures. At the bottom of the stream he has shown us the thermometer stands at 34° off Florida. Off Charleston, where its surface is three or four times as broad as off Bemini, the cold water of the bottom is reached between "300 and 500 fathoms," or say 2800 feet, an increase of its original depth. Some of the experiments off the Carolinas showed that at 525 fathoms its bottom had not been reached. Before it has attained the offings of Cape Hatteras its volume is over 375 miles in width, nearly ten times what it was off Florida. The careful observations of the Coast Survey give: "Off Cape Hatteras the temperature at 525 fathoms was only 54° Fahr.; at 425 fathoms it was over 60° Fahr.!" (See Bache on the "Distribution of Temperature in and near the Gulf Stream off the Coasts of the United States.") And off Cape Henry other examinations proved

that at the depth of 500 fathoms the bottom had not yet been found, for the temperature was as high as 52° . Behold, then, the Bemini stream has grown into more than tenfold its original volume! How, too, we might ask, was it that Bache found off Hatteras, at a depth of 425 fathoms, a body of water "over 60° ?" Was this not a portion of the "hot and heavy" water from the equatorial or Antilles current marked by Keith Johnston as the "Northwest branch of the equatorial current?" Diverted and deflected by the crescent formation of the West Indies, this mass (several times larger than what is known as the Gulf Stream at Bemini) moved to the northwest under a triple impact. A part of it remains on the surface and unites with the Gulf Stream as a surface drift, described in the "Physical Geography of the Sea" (p. 47, § 141, 8th edition). And the remainder and larger part, becoming heavy from evaporation under "a hot and copper sky," sinks down and moves off as an undercurrent to commingle its briny flood and its kindred elements with the original current from the Gulf.

If further proof of this is needed, the writer refers the reader to some remarkable facts which have been long recorded, but are evidently explicable only by the view now offered.

The Coast Survey Report for 1858 (p. 220) shows that the "easterly set of the Gulf Stream, through the keys of Florida, disappears during the regular summer trade-winds." In crossing from Key West to Havana the Gulf Stream runs much stronger on the Cuban side. The oldest and most skillful and experienced pilots have testified that, during the season of the summer trades, the winds seem to block up the outlet from the Gulf; and numbers of these seamen assert that not unfrequently, at this time, they can detect *no Gulf Stream at all*. From no less an authority than Commodore Bainbridge, we learn that on one occasion, while cruising off Cape Florida, his vessel was "*drifted to the west*." In other words, the current of Bemini was running back into the Gulf of Mexico, instead of running out of it. These facts receive confirmation from their exact agreement with Livingston's theory—a theory, it is true, long ago disproved—but doubtless having these observations or similar ones for their basis.

It is incredible that the Bemini current should linger and the Gulf Stream roll on, in unslackened speed and undiminished volume, unless we concede that, north of Bemini, it receives a mighty *affluent*. During the summer trades spoken of the thermal equator is moved northward, and, with the thermal equator, the equatorial current itself. It is, therefore, easy to see how the true Gulf Stream at this season may, under peculiar circumstances, be represented as moving in a northwesterly and afterward in a northeasterly curve, not out of the Gulf of Mexico, but from the shores of the Windward and Lesser Antilles.

A glance at the picture of the vertical sec-

tion of the North Atlantic will satisfy us of the correctness of this reasoning. The passage for the supply of the Bemini stream, between Yucatan and Cuba, is but a trifling *fosse* compared with the magnificent opening of the Antilles, or northwest branch of the equatorial current, off the Windward Islands. The one is two thousand feet deep, the other fifteen thousand feet deep, and the width of the latter is still greater, proportionately. "The tooth of running water is very sharp." Is it possible that the equatorial current in deep sea has, by erosion, cleft and opened a channel-way through the Atlantic bed to the northwest and north? It would seem so; for, if the liquid ocean were dried up, we should see, according to the results of soundings by the Hydrographic Bureau, just such an excavation. From the northern shores of the island of St. Pedro (latitude 2° N., and longitude 28° W.), in a line running northwest, and very close to the Windward and Lesser Antilles, and thence around the west of the Bermudas, the basin of the great Atlantic Canal, as Ansted calls it, is cut and gashed by a deep longitudinal valley—a *canal in a canal*. This inner and central channel is very deep, averaging thirty-five hundred fathoms. Its sides are elevated from the sea-bed to within only eighteen hundred fathoms of the surface. There is thus found in depths of the ocean a *submarine canal*, so to speak, extending from the equator toward the pole, already traced through forty-five degrees of north latitude. Indeed, it may be said to have been traced even to a greater distance south of the line. Its mean breadth at the greatest depth exceeds three hundred miles. If, as Ansted has so strikingly remarked, "the form and depth of the Atlantic bottom have a great influence on the movements of its waters," we may almost assume that we have here a clew to the motion of the equatorial current deflected by the Antilles. The latter would then enter the Gulf current in about the latitude of the Bermudas, which is in exact agreement and correspondence with the thermometric soundings of the Coast Survey.

This reasoning is strongly corroborated by a singular and, on other grounds than those now presented, an inexplicable fact. Vast patches and fields of the Sargasso Sea are brought into the Gulf Stream and borne across the ocean. These fragments of long kelp are drifted even so far as the Strait of Dover. "It is not unusual in the months of July and August," says the same distinguished English geographer lately quoted, "to see large quantities of drifted weed in crossing the channel between Folkestone and Boulogne. In perfectly fine weather the water is sometimes almost as much covered with vegetation in these seas as in the immediate neighborhood of the great Sargasso Sea itself." The floating masses of algæ have evidently been torn off from the southwestern borders of the weedy sea by some passing current uniting with the Gulf current. The southwest-

ern borders of the Sargasso face the Antilles, and are separated from the northeastern shores of these islands by a narrow sea not over three hundred and fifty miles wide—a width insufficient to allow the passage of the northwest branch of the equatorial current, according to Keith Johnston six hundred miles wide. It is a physical impossibility that the weed, finding its way into the English Channel, could get there except in the way mentioned. For the northern edge of the Sargasso Sea is thirteen hundred miles south of the so-called recurvation of the Gulf Stream and of its easterly drift. And any other oceanic surface currents or drifts in the North Atlantic would bear the weed far away from the shores of England.

The dislodged matter, it is probable, is influenced by the southwest winds (the antitrades) to depart from the normal track of the Gulf Stream and veer to the eastward.

How far the Gulf Stream has been traced into the arctic basin is one of the most interesting inquiries of modern geography. We have already seen its climatic influences extending beyond the charmed circle of the North, and in dead of winter keeping open the Norwegian harbor of Hammerfest, in latitude 72° north. (We allude to the subject as throwing light upon the hypothesis of the Gulf Stream volume now advanced.) "It is owing to the Gulf Stream," says Arthur Mangin, in his magnificent work, "Mysteries of the Ocean," "that, in the north of Spitzbergen, the limit of eternal ice and snow, instead of sinking to the very level of the sea, maintains itself at a point fully 550 feet above" (page 115). The Devil's Huck, a considerable elevation in Spitzbergen, has its summit continually shrouded in fog. Lord Dufferin, while sailing in the yacht *Foam*, distinctly perceived the Gulf Stream water 140 miles from the little island near Spitzbergen known as Bear or Cherry Island. Laing, in his account of a voyage to the former, says the climate is not entirely destitute of vegetation, and some plants are found which "convey a faint representation of a more southern country" (page 57).

But these islands stand related to the Gulf Stream flow only as Boston or New York do. They receive only an occasional and fitful benefit from the tepid waters.

The climate of Iceland likewise, though milder than Greenland, is much more vigorous than that of the corresponding latitude on the eastern side of the Atlantic. Seventeen of the Faroe Islands are habitable: they are rugged, mountainous, and rocky, and the intervening currents are deep and rapid. "The inner harbor of Hammerfest," says Laing, "though seldom agitated by winds, was never seen frozen over." In 1808, the captain of this harbor states, there were seen two hundred sail riding in it at one time. Codfish, which are prepared by exposure to the sun, are ready for market in Hammerfest in three days, while the same process of preparation in Newfoundland requires, in the best weather, at least five days. The ob-

served range of the thermometer at this Norwegian city, during the stay of some weeks of the voyager quoted, was between 75° and 80° Fahr. From the North Cape it flows onward, says a celebrated French writer, to console the pole—to create that warm, or rather that unfrozen, sea which has been recently discovered.*

With the facts which have been now set before the reader, he is able to form for himself an intelligent opinion of the correctness of the entire reasoning which is advanced in this article. The last-mentioned facts concerning the extent to which the energy of the Gulf Stream has been distinctly traced seem, reflexively, to indicate its nature, its cause, and its volume.

The hypothesis of the Total Gulf Stream Volume is here, the writer believes, propounded and demonstrated for the first time. The views he has enforced are his own, and for nothing, either in their conception or expression, is any one responsible but himself. He has, however, diligently sought light from every quarter. Having addressed a distinguished navigator who sailed under Commodore Wilkes, and was afterward the honored hydrographer of Commodore Perry's Japan Expedition, and who has, perhaps, more than any living sailor, been led to examine the subject, and having laid before him the substance of the hypothesis, the following indorsement was received:

"The theory (of the Gulf Stream), so far as the question of its having its origin from the Gulf of Mexico between Florida and Cuba is concerned, has, with me, like yourself, been the subject of a good deal of reflection; and I feel sure observations will prove that it receives accessions from the northern part of the equatorial current, which, passing to the north of San Domingo and east end of Cuba, meets the outflow (to the eastward) from the Gulf, and acts as a wall or fender to turn the latter (the Gulf Stream proper) short to the northward, along the east coast of Florida; while the reciprocal action against itself carries the water of this northern part of the equatorial current also to the northward, to give additional volume to the Gulf Stream. These two masses of water, being of nearly the same temperature (that from the Gulf being probably the hottest, from having been longer under the sun), mingle more or less freely."

This brief but pertinent and comprehensive reply has encouraged the publication of this paper, in the belief that science will soon demonstrate that the Antilles current goes to swell the great current from the Gulf, performing for it the office which, according to ancient fable, the classic Alpheus of the Peloponnesus, flowing under the sea, performed for the humbler stream of Arethusa. The late deep-ocean dredgings, by Professors Carpenter and Thomson, go so far as to prove the existence of an unbroken sheet of icy water spread over the dark floor of the deep. The marine life is

* Michelet's "La Mer." The allusion is to Kane's Open Sea.

every where, at 2400 fathoms, influenced by an arctic coldness; and, if we are informed aright, the results of their labors all show the interchange of polar and equatorial waters. If we have succeeded in the aim of the argument, the Gulf Stream and all oceanic currents are seen in new light, and clothed with new dignity and grandeur.

What the exact mass of the Antillian tributary may be must be determined by the diligent use of the deep-sea sounding apparatus. Meantime we can see, as in noonday clearness, that the grand system of oceanic circulation, from pole to equator, is kept up, to use the figure of the eloquent Julien, as precisely and unchangeably as our planet describes the elliptic orbit around its central star. We see enough to know that the limpid and limitless equatorial ocean is precipitated upon the polar basin. We see enough to convince us that the Gulf Stream is *not* a myth.

Above all, we behold the wheels of the terrestrial machinery in motion—every breeze that blows, every wave that rolls, even the volcanic fire beneath the sea, conspiring to make good to man the dominion of the earth, and to in-state him in the possession of every inch of the Heaven-given heritage, from pole to pole.

TRANSMUTATION.

IT was nearly sunset of a clear summer's day when, in the large, comfortable, but unadorned kitchen of an old-fashioned farm-house, which stood almost by itself on a rather lonely and isolated by-road, an elderly woman was seated alone.

The woman was not positively ill-looking in any marked degree, although the restless, furtive glances of her cold, sharp, watery blue eyes, and a nervous twitching about the thin, closed lips, might have been held suggestive of low craft in purpose and asperity in temper. "Commonplace—commonplace to the last degree!" would have been the epithet most likely to have been applied to her by the chance observer.

Yes, commonplace she most certainly was, from the thin locks of rusty, yellow-gray hair, even to the down-trodden and shapeless shoes. You have seen fifty just such women, no doubt, and you will probably see fifty more just like her; for it is a common pattern to be found every where—tall and angular, high-shouldered, hollow-chested, sallow, thin, and stooping.

Her dress was a rusty black alpaca, scarred and stained with the wear of many months, and a cap and neck-handkerchief which, if "cleanliness is next to godliness"—as our nursery oracles used to tell us it was—certainly did not denote her as holding a very conspicuous place on the roll of immaculate purity!

But all these little minutiae, though they may serve to call up the woman before your imagination, are nothing *per se*; they were only the rather exaggerated peculiarities of her age, sex, rank, and position, and might well have been pass-

ed over with the innocent and not unfriendly remark quoted above, "Yes, very commonplace!"

But what made the woman repellent, and gave to her an individuality, was the all-pervading vulgarity of look and manner which invested her like a mantle from head to foot; and a lurking something in her glance, half-cunning, half-fearful, as if the vicious will was only held in check by the cowardly spirit.

She sat in her high-backed wooden chair at some distance from the open window, and was restlessly trifling with a letter. She had taken it out of her pocket two or three times, reading it over carefully, and with an evident effort, as if painfully striving to make herself mistress of its contents by rote, and returned it each time with a reflective and doubtful expression on her face. And now she had again drawn it forth, and re-read it; and then, having folded it, and replaced it in its envelope, she was (after a fashion not uncommon among persons to whom the advent of a letter is an infrequent occurrence) matching closely together the torn edges of the envelope, and smoothing and pressing the letter to make it look as if it had not been opened; though all the while she thus idly trifled with it, the changing expression of her face denoted perplexed and possibly conflicting emotions.

At last her reflections seemed to have reached a definite conclusion; for suddenly raising her head, and turning in the direction of the open window, she called, in a sharp, querulous voice, "Ma-hit-a-bel!"

"Yes 'm," came the immediate answer from outside the window; and the voice of the unseen speaker was that of a young girl, sweet and musical in its tone; but the manner was crisp and tart, almost defiant.

There was silence for some minutes, while the trifling with the letter still went on; and then, as if suddenly remembering that her call had not been properly attended to, the woman called again, with even greater asperity than before, "Ma-hit-a-bel!" and again came the same short, defiant answer—"Yes 'm!"

"What do you keep saying 'Yes 'm' for, without coming, when I call you, Hitty? Where are you, hey?"

"Outside the window. Where did you s'pose I was?"

"What are you about out there? what are you doing?"

"Watering the flowers, and picking the bugs off the squashes, I guess; and there's an awful lot of them!"

"Didn't you hear me calling of you?"

"Yes 'm."

"Then why in the world didn't you come in?"

"You did not tell me to, did you?"

"Well, if I didn't, you knowed well enough I wanted you."

"I'm sure I didn't; you didn't say so—how was I to know it?"

"Well, then, you know it *now*, don't yer?"

"Yes 'm! Very well, I'm coming.

"Here's one—to make ready,
And two—to prepare;
Three—to go slam-bang,
And four—to be there!"

sung the sweet but saucy voice, as, suiting her action to her words, the singer placed her hand lightly upon the low window-sill, and with one agile bound sprung into the room, and repeating the words "be there," stood before the woman; and, certainly, a stranger-looking object never entered a room in stranger way!

She was a slight, but well-grown girl, of possibly twelve or thirteen years—just at the age when young girls are usually most awkward, when the rapid development of length of limb rather puzzles the youthful possessor as how to use gracefully the sudden and unlooked-for elongation; but the untrammelled freedom of Hitty's country life, the entire absence of all artificial training, and a naturally healthy organization, had given to the girl this advantage, that her free motions, though often startling in their suddenness, had all the natural grace which we see oftenest in the unconscious movements of infancy; and although her abrupt entrance into the room could not by any means be considered elegant, still it was so light and free as not to be ungraceful; and the pose of her head and her whole attitude, as she stood with folded hands before the woman who had summoned her, was easy, piquant, and saucy.

In person she was tall and slight; her naturally fair skin was sun-burnt and covered with unsightly freckles up to the very roots of her immense crop of red hair, which was drawn back from off her forehead and braided into two stiff, cable-like braids, so tightly as to give the impression that the curve of her arched eyebrows was the result of the unnatural tension. These stiff and unyielding braids stuck out, one behind each ear, and were terminated at their extremities by coarse twine strings, to prevent the possibility of their unbraiding in the least. The object of this strange and most unbecoming mode of arranging her hair, Hitty would most probably have explained, was to "keep it out of mischief, for it was eternally bothering!" But these extremely rigorous measures would have seemed to fail in their accomplishment, for they had not served to keep it from the inroads of hay-seed and thistle-down, with which its red surface was profusely peppered.

There were two good points in the girl's face which not even tan and freckles could disguise—clear, deep, liquid blue eyes, now flashing with scornful mirth, but wearing a look of wistful tenderness in their blue, violet depths; and a well-formed mouth, fresh and dewy, but wearing now a smile of contemptuous indifference.

The rest of her person was invested in a scant, coarse, blue-checked garment, with long sleeves, made much like a butcher's frock, which descended from her chin even to the bottom of her clothes.

It was evident, as they remained thus for a moment, looking each in the other's face, that the stronger and higher mind of the child had already asserted its supremacy over that of her companion; and that while she regarded her with saucy indifference, and dislike only kept in check by a sense of what was due to the requirements of the fifth commandment, the woman regarded her with mingled and ill-concealed dread and aversion.

"Ma-hit-a-bel!" she began again, as if doubtfully.

"What 'm?"

"I never saw sich a gal as you are, never! I declare you're enough to kill any body to have you round; you come into that winder jest like a great bear!"

"Did I?" said the girl, carelessly. "I wonder at that, for I don't think I ever saw a bear, and I don't know how he would look; but I know just how a wolf looks, in 'Little Red Riding-hood,' you know; and I've seen somebody," she added, fixing her eyes meaningly upon the face of the listener, and thus giving an unpleasant personality to the remark, "who looked just like him! Why, in bed, you know, I could hardly tell the difference. Ah, poor dear little Red Riding-hood, I always did pity you!"

"Ma-hit-a-bel Cutter!" said the woman, angrily, "you're the very sauciest gal I ever saw in my life!"

"Yes 'm, I know it; but you've said that a dozen times before. Could not you make an effort, and get on a little?"

"Yes, Hitty; I've got something to say to you."

"Oh, Lordy! Gran'mother, don't!"

"Don't what?"

"Don't say something to me. I hate to be said something to; and, besides, I have not got the time to spare. The bugs will eat your squashes all up, if you keep me here; there's lots of 'm, I tell you now; they are eating on the right hand, eating on the left. I give you fair warning, they are hard at it; you must not blame me!"

"Never mind the squashes; I don't care for them."

"You don't? Well, I am surprised! I thought you did. Well, then, if you don't, I don't; so up and at it, bugs—free and easy—go in and win!"

"Hitty, I never saw sich an outrageous gal as you are in my life!"

"No; I s'pose you never did; and I wish, with all my heart, you had never seen this one; but, there, if the sermon has got to be preached, do give out your text and go ahead; I'm ready; come on." And she flung herself down upon the unpainted floor as she spoke, and snatching up a venerable gray cat which came purring around her, she very unceremoniously turned the patient animal upside down, laying her upon her back between her knees; then grasping one of the creature's front and one of its back paws

in each hand, as it lay upon her lap, she nodded and bowed to it, as the great, gray-green eyes opened and looked up into her face, talking to it the while as if it had been a petted child:

"Now, Morgiana Longtail, my darling cat, do be quiet, and behave yourself as you should do. Your grandmother has got something to say to you; so be good, and listen, I tell you. Now, grandmother, all ready; get on as fast as convenient, will you?"

"Well, Hitty, I want to tell you—I've got a letter."

"Have you? Well; and can't you make out to read it?"

"Read it! yes, of course I can."

"Oh! you can, can you?" said the girl, with indifference. "I supposed you couldn't, and wanted me to read it for you. If you have read it, what do you want me for?"

"Because," said the woman, doggedly, "the letter concerns you."

"Concerns *me*?" said Hitty, raising herself up, while her face flushed, and a look of blended curiosity and anxiety replaced the former listlessness of her manner. "From the selectmen, or the school-committee, I bet: about that old window I broke in the school-house. Well, I did break it," she added, while the hot crimson flush rose to the roots of her red hair—"I did break it, and I ain't going to deny it. It was an accident, and I'm sorry for it, and I didn't mean to do it; but I did break it—and now, what are they going to do to me about it?"

"The letter is not from the school-committee, nor the selectmen neither, Hitty."

"Oh! it is not, is not it?—so much the better, then," said the girl, relapsing into her former mood and attitude.

"Well," said the woman, regarding her with a sort of hesitation, "why don't you ask me who it is from?"

"Oh! I don't much care to know; if you are going to tell me, I suppose you will without my asking; and if not, I don't think asking all day would make you tell me."

"Well, Hitty, the letter comes from your gran'father."

"My grandfather! Whew! that's a likely story to tell! Dead men don't often write letters, I guess; at least not to little girls like me, that ever I heard of."

"Your gran'father is not dead, Hitty."

"Isn't?—then you've told me many a whacker! Why, you always said that he was dead."

"I never did."

"No?"

"No!"

"You did, now. Oh, come; that's a little too much! You—told—me—that he died in California; with the cholera infantum, I think you said it was."

"I say I never did; cholera infantum, indeed! Nonsense, Hitty; you oughter know better, great gal as you are. Cholera infantum! nobody but babies has it; it was the chol-

era morbus. I told you that my husband died of that in Californy; that's what I told you, and that's so."

"Well, have it 'cholera morbus,' if you like that any better. I suppose it won't make much difference to any of us now; but was not he the old man there?" said the girl, indicating by a rather supercilious nod of her head a melancholy and smoke-stained silhouette, in an oval, black frame, which adorned the fire-place—"wasn't that your husband, Deacon Josh Cutter?"

"Yes; but he was not your gran'father."

"He wasn't? Good gracious! hallelujah chorus! and so forth. Now is not that splendid?"

"I'm sure I don't know why you should say so; he was a very excellent man, a deacon of Mr. Webber's church; and when he died—"

"Oh yes!" interrupted the girl, eagerly; "I know all that; you've told me that, time and time again; but I don't fancy his looks—I never did, and I never shall, and I can't help it."

"I dunno why not, I'm sure; I only wish you had half his good looks."

"Thank you; half would be enough for me, I guess," said the girl, casting another mock-reflective look at the black and white memento of departed worth. "I really think half of his nose and half his queue would be quite as much as I could venture to accept. I would not wish to be too grasping, more especially as it seems I have no claim upon him; but if the deacon was your husband, as you have just said, may I venture to inquire how did it chance that he was not my grandfather?—that seems to strike me as a little peculiar. How was that?"

"Because," said the woman, regarding her anxiously, "I am not your grandmother."

"Glory and praise!" shouted the girl, turning a somersault upon the floor; "that's the greatest news yet. I declare the newspaper man ought to get out an extra. Hurrah! 'John Brown's soul is marching on,' I guess; and so is mine. Oh, excuse me, my darling Kitty! I hope I didn't jam your little, precious old paws; but I couldn't help it; such news doesn't come every day in the year, does it? And now, Mrs. Cutter, having gone so far, and told me who were not my grandparents (for which I thank you from the bottom of my heart), may I ask you to go a little farther, and tell me who my grandfather who writes the letter is?"

"His name is Arnold."

"The old Harry!" said the girl, now fairly beside herself with excitement; "and 'bully for you,' Grandfather Arnold!"

"No," said the widow, "that was his father; his name is not Harry, it's Ed'ard; your gran'father is Judge Arnold."

"Edward Arnold!" repeated the delighted girl; "oh, what a sweet name! sounds just like a novel or a poem, I declare if it don't; it seems to do one good to speak it. A judge, too; then, I suppose that he is a gentleman, ain't he?"

"I guess he thinks so."

"And I dare say he is right; and now, Mrs. Cutter" (it seemed to give the child pleasure to substitute these words instead of "grandmother"), "I will read the letter from my grandfather Arnold;" and she reached out her hand for the letter.

"No, you don't, nuther," said the woman, cautiously withdrawing the letter from the reach of the eager hand. "This letter is to me, not to you."

"Didn't you say it was from my grandfather?"

"Well, yes; that is, it's from his agent—his lawyer, I s'pose that is."

"And is it not about me? You said it was."

"Yes; and I'm going to read it to you, at least some parts on't, if you will ever hold your tongue long enough."

Then Mrs. Cutter put on her glasses again, fussily wiping and adjusting them with a slow delay, torturing to the impatient Hitty; and having had some practice in spelling out its contents half a dozen times before, which practice had, however, not made her perfect, she managed to read as follows:

"MRS. PERSIS CUTTER,—I am directed by Judge Arnold to inform you that having returned to this country after his long absence, and intending to re-establish himself in his own home, he means to take charge of his grand-daughter himself. As your quarterly allowance for the board and use of the young lady has been regularly paid'—(hum, hum)"—interpolated the incautious reader, finding she was entering upon private grounds—"—(that isn't it, let me see)—'I inclose a check for'—(no, that does not concern you either)—'to meet any extras'—(why, where in the world is it?—oh, here it is!)"—'he wishes Miss Belle Linzee to be at the station in your village at 11 A.M., Thursday, June 16, where she will find a messenger to bring her to L—— in the cars, where her governess will be waiting to receive her, and take her home at once."

"I am, etc., etc.,

"WILLIAM R. PARKINSON."

It would have been a study for a painter, could he have seen the girl as she sat upon the floor, with wide eyes and parted lips, listening almost breathlessly to this, to her amazing letter, not one word of which escaped her, although she was too much bewildered to comprehend and arrange it all in her mind.

"Who is the young lady, Mrs. Cutter?" speaking almost reverentially.

"Why, you, you born goose; who else should it be?"

"Me a young lady? I look like one, don't I?" as putting the cat gently aside, she sprung up and looked down upon herself in silence, while her red lips quivered, and tears of real feeling dimmed for one moment the lustre of her clear blue eyes. But it was but for a moment; her whole life had taught her lessons of self-control, and she had recovered herself before her companion's slow perception had remarked her unusual excitement.

"Well," she said, "I don't quite understand. It says a messenger will be sent for her—what does that mean, I wonder: what is a messenger? Is it a man or a woman?"

"I don't know."

"I guess it means a constable, don't it? That's worse than the selectmen; do you suppose they will put me in handcuffs, as they did the poor fugitive slaves?" she asked, apprehensively, for her unguided and miscellaneous reading of sensational novels had filled her mind with a crude mass of ideas which her secluded life had never served to assort or rectify. "And then, the young lady is to be met by her governess; do you know what sort of thing a governess is, Mrs. Cutter?"

"Well, yes; I reckon it means a sort of schoolmarm, at home in the house; and I guess you've got to be screwed pretty tight by her—yes, night and day too, I take it," said Mrs. Cutter, maliciously.

"And I should think it would need it," said the child, gravely and reflectively; "there's an awful sight to do, certainly. I vow I don't envy her her job; she'll find she's got her match, I guess. Well, next, what was that about a Miss Belle Linzee?—who's she?"

"Why, who in the world do you s'pose, you little fool? You, of course."

"But my name is not Belle Linzee, is it?"

"Like enough! Your father was a Linzee, I know; and they used to call your mother Mabel. Of all the ridiculous names I ever heard, that's the beatemest!"

"I don't think so; it's a lovely name; I like it. But what did you call me Hitty for?—such a vulgar, hateful name!"

"Well, I suppose Mabel is short for Mahitable, ain't it?"

"No, indeed! no such thing; not the least like it in the world! And so you tucked in the Hitty, did you? I don't thank you."

"Yes, I did; Hitty is a good, useful, sensible name, and I s'pose your folks dropped it out by mistake."

"No mistake at all; I'll answer for that. You may keep your old Hitty; I don't want it. And pray, why did you call me Cutter, if my name was Linzee? Where's the mistake there?"

"I didn't; you called yourself so when you was little, and I thought it was jest as well."

"I don't; but that is a matter of taste, perhaps, and I like my own name best. But, one thing more," and again the lips and eyes quivered with emotion; "you spoke of my mother. Oh! tell me true; did I ever have a father and mother of my own, as other girls have?—oh, tell me that!"

"Of course you had. I never see such a born fool as you are, Hitty! How did you think you came into the world? I s'pose you thought you growed right up out of the ground like a mushroom, didn't you?"

"I might well have thought so, from the way in which I have been reared," said the girl, bitterly. "But tell me this: are my parents living?"

"I dunno; I guess not. Come to think on't, I know yer father's dead; he was killed. I know that much."

"Killed?" echoed the little listener, with horror in her look and tone. "What! in the war?"

"Laws, no! some accident; I don't justly remember what it was. I s'pose I knew at the time; but I've forgot now. But I know that when he died, your mother went crazy, or had fits, or went into the consumption, or something or other terrible bad, but I can't tell you just what; and that's why they went abroad. And I reckon she's dead too, and so the old gent has come home and wants you."

"The dear old man!" said the child, with a gush of tenderness never felt before. "And now, how in the world came I here? What am I to you?"

"Nothing." The girl's face brightened. "My daughter she was your nurse, and when your folks broke up, and went off all of a sudden, as it were, they had to leave you with her; and she come home to live with me. And when she was took away from me, the agent didn't seem to know justly what to do with you, and so I said I'd keep you."

"Then," said the girl, drawing herself up, with a natural, but very unconscious, assumption of new-born dignity—"then I have really been your boarder all this time, instead of your slave, as I have been made to believe, have I? And I dare say you have been well paid for all you were supposed to be doing for me."

"Well, yes; I don't say but what your folks has been liberal enough. They have paid me all I asked; for I always told them you was an awful limb to manage; and so you are!"

"Thank you, Mrs. Cutter, for your flattering remarks about me; perhaps the time is coming when I may be able to repay you for all kindness. And now, when am I to go?—did it say?"

"The letter says Thursday, the 16th."

"Yes; and to-day is Tuesday. The day after to-morrow, then."

"If you are ready. I dunno any reason why you shouldn't go then; do you?"

"Me? no, indeed! I only wish I knew there was no reason why I shouldn't go now, to-night!"

"Well! you are civil; I'll say that for you."

"No, Mrs. Cutter; as we have never indulged ourselves in that sort of thing, it is hardly worth while, as I am going so soon, to make a beginning of it now; so, as I have a good deal to think about, I will leave you for the present."

Catching up the old cat again in her arms, Hitty left the room as she had entered it, through the window, and running at full speed to work off some of her superabundant excitement, she fled to a secluded and shady nook, under some old apple-trees which, by long use, she had learned to regard as her own peculiar sanctum, and there flinging herself at full length upon the grass, she dandled the patient cat high above her head, and broke forth:

"Kitty! Kitty! Kitty! Kitty! my only com-

fort and my true confidante; what a day this has been! Can you understand it all, my furry friend? If you do, it is more than I can. I think little Prince Silverwings or Cinderella's dear old godmother must be round in the neighborhood somewheres. Let me see: in the first place, old Josh Cutter, my grandfather that was, was never my grandfather at all! and Mrs. Cutter, my grandmother that is, is not my grandmother at all!—three cheers and an extra thanksgiving for that, Morgiana Longtail!—then, my grandfather Arnold, that never was my grandfather, is going to be my grandfather for evermore. And I've had a father and mother like other folks—ah! would to Heaven I had them now! That's the only sad part of it; but then, Pussy, you know it is so respectable and comfortable to have had them at all that I ought not to mind that—it seems as if it would be ungrateful in me, don't it? And then, I am not Hitty Cutter at all—oh! what a hateful name that was!—but I'm Belle Linzee; and I'm a young lady! a young lady!! a young lady!!!—Pussy! do you comprehend that fact? Oh! well may you open your great gray eyes, and whisk your beautiful tail. (Bless your heart, my darling, did I squeeze you too hard? Excuse me, dearest, won't you?) You see this is a day of mighty changes; it seems to me the world is tipping upside down; and if I don't hold you tight and fast, I'm afraid in five minutes you will turn into a dog, and bark in my face; and you know I never did like dogs much better than you did, did I?"

In this way the excited and jubilant girl ran on, until she was fairly breathless and weary; and then dismissing the cat (who was not sorry to be released), she sat down to reflect seriously upon all that had occurred, or all that seemed likely to occur. This gave her full occupation until bedtime.

The next morning Hitty awoke early, as was her wont, and after she had fully convinced herself that yesterday was a reality, and not, as she almost feared, a splendid dream, she set herself busily to work, for she felt she had much of importance to perform. And first, she emancipated her tame robin, whom she had cured of a broken leg, and heard with unmixed pleasure his glad, rejoicing song, as he soared aloft on the free blue air. Next, she disenthralled her pet squirrel; and though she could not by any possibility replace the fine, bushy tail which he had lost in a neighbor's rat-trap, and the loss of which important appendage, by materially depreciating his market value, had made him hers, yet she saw him run up a tree, in a rather rudderless and unbalanced manner to be sure, but still very glad to be able to run at large at all—though the truth was, his largeness was reduced nearly one-half by the abduction of his splendid caudal extremity.

Then she carried her blind hen, with its one miserable chicken, as a present to little Sammy Twist, the miller's little lame boy—explaining to him, with great amplitude and exactness,

that though Cuddie was a splendid hen to lay and to set—indeed, seemed rather to like such sedentary employments, perhaps because by reason of her blindness she had not so many resources in the out-of-door line—and was always remarkably lucky in hatching out, still, as from that aforesaid infirmity she was not good at rearing her young ones, rarely bringing more than one or two of a brood up to maturity, she informed him of a bright idea which she had been meditating upon—namely, to form a partnership between Cuddie and some other good, respectable hen, and let Cuddie do all the laying and hatching business, and be the “sleeping partner,” and the other to be the “active partner,” bringing up the chickens and doing all the running and collecting duty of the firm. But fully enjoining it upon little Sammy, and impressing it well upon his young and ductile mind, that poor Cuddie was to be respected none the less, but rather the more, on account of the infirmity, which was clearly her misfortune, and not her fault; and having seen the virtuous but ill-fated Cuddie safely bestowed in a pen, so that her one remaining chick could not stray away and vex her maternal bosom, she felt satisfied that she had done her best for her poor dependent. This done she walked a mile and a half with her mud-turtle in her hand, carrying him carefully inverted on his shell, with his snaky head, flabby, spotted paws, and ridiculous file-like tail, thrust out in all directions, and wagging in wonder and alarm, to the very spot from whence she brought him; stopping two or three times on her road, however, to kindly set her little captive down to let him recover himself a little, fearing his inverted mode of progress might give him the headache; and as soon as he regained his wits enough to try to walk, catching him up and resuming her journey; and had at last the pleasure of giving him back, whole and entire (and doubtless with enlarged ideas), to the muddy joys of the swampy bog from whence he came, and where she probably supposed and fondly hoped that he would find that

“There were his young barbarians all at play.”

Then returning, she stopped in the village, and invested her whole amount of currency (three cents) in a couple of lemons, not quite so fresh as could be desired, but certainly cheap at the price; and as she loitered through the shabby little garden she gathered a few of the early-ripened flower seeds, as the sole reminiscence of all she had ever known of elegance and refinement in her early home.

After their frugal dinner was over, Mrs. Cutter, wooed to an unwonted liberality by the large amount of the check which had been sent her, took the little girl to the village shop, and purchased her an outfit, consisting of a pair of coarse stockings, a cheap, tawdry-colored shawl, printed on muslin de laine, and a pair of sturdy, low-cost leather boots; and at the earnest solicitation of poor Hitty, and remembering

it was for the last time, she munificently added a pair of bright, lemon-colored cotton gloves, costing one shilling.

Hitty did cast longing looks upon a cheap red sunshade, feeling that the possession of it would give the finishing-touch of grace and elegance to her appearance on the coming day; but she did not dare to ask for it, for the present expenditure had been lavish in the extreme, in comparison with any thing which she had ever known before; and with a child's generous recklessness of pecuniary matters, she had already forgotten the few words Mrs. Cutter had blunderingly let slip about the check, which was no doubt intended for the child's benefit, but which the woman's rapacious spirit had chosen to believe was meant as a bonus for herself.

Then returning home thoroughly tired out with the fatigue and excitement of the day, both mental and physical, our young heroine retired at once to the miserable little attic, which she was to occupy, as she fondly hoped, but one night more; but, even tired as she was, the poor little thing kept herself awake with difficulty, and by main force, until she had performed one more act of preparation.

Her freckles—“their name was legion”—had always shocked her own sense of beauty and refinement, and had drawn upon her many times the mortifying remarks of others. She hated them, but, with a fierce disdain born of her distasteful surroundings, she had made no effort to get rid of them, stolidly accepting them as only one among the many crosses of her daily life. But now a new ambition was stirring within her, and remembering a recipe once imparted to her by an older and pitying school-mate, she had determined to try it; and having procured a cup of milk, she squeezed the lemon juice into it, and rubbed her face, neck, and hands with the mixture.

This was all well enough, had poor Hitty been contented with a small and gradual removal of the enemy; but, eager for victory, flushed by partial success, and believing, like many older persons, that if a little of a thing is good, a good deal of it will be better, she grew absolutely furious in her application, and rubbed and squeezed and squeezed and rubbed, until her fair and tender skin, which is always the sort naturally most a prey to these unsightly invaders, was almost excoriated, and red to the very roots of her hair. Then, with a mental hope that the morning would find her

“O'er all victorious,”

she flung herself on her bed, and as soon as her flaming face, which stung like nettles, permitted, she sunk into dreamless sleep. But, alas! the morning did not justify her hopes, for the fair skin, resenting the harsh treatment it had undergone, was one universal pink flush, like a case of incipient scarlet-fever, and drew upon its owner the notice of even the unob-servant Mrs. Cutter, who remarked, in conser-

nation, "Why, Hitty! child alive! what in natter have yer been a-doing to yourself? Your face is as red as a beet, and you look for all the world like a new-skinned eel." This was not a pleasant observation exactly, in the ears of a young lady just coming out. But, fortunately for the girl's peace of mind, her life had not served to foster personal vanity; and though she was sorry to look worse than usual upon such an important occasion, still she did not suffer it to distress her. So she bathed her yet tingling face in warm milk and water, and powdered it with flour, and then proceeded to dress herself for her entrance upon her new life, and the journey, the first stage of which was to be performed on foot.

At nine she was ready, dressed in her best, with her hair nicely combed, and braided tighter than ever, but two bits of yellow string taking the place of the twine; her dress, a limp faded lawn, with the tawdry shawl of many colors; the stiff boots, redolent of the odor of leather; a cheap hat of no particular fashion, with a few feathers in it, which poor Cuddie might have recognized had her visual organs been more perfect; and the bright-colored gloves, which, being an altogether new adornment to her, she wore with reverence, keeping her fingers all wide apart, and stiff as a star-fish in their unaccustomed stateliness; a good-sized cotton handkerchief, with a high-colored border of red and blue, being carried gingerly between her thumb and finger. But, ah! there was one hard parting still to be got through with: poor "Morgiana," the cat, the only living thing she had ever regarded as a friend and companion, and upon whom her young heart had expended a wealth of love worthy of a far more appreciative object.

Half a dozen paroxysms of love, regret, and tenderness had the patient old creature already been subjected to since the letter had been received; half a dozen times had her little mistress indulged the thought of taking the old cat with her on her long journey—à la Whittington—but then, as her good sense told her, the cases were not exactly alike in all points. Whittington was his own master, and totally independent; and she was not. Then, Whittington had no grandfather Arnold, no governess, and no messenger to consult the wishes of; and she had! There were persons in the world, it was said, who did not care for cats; indeed, she had heard of one individual who really disliked them. It seemed almost incredible, but it might be true, and the "messenger" might be one of that strange sort; and the idea of Morgiana as a traveling companion had to be given up.

Now she bore the long-tailed treasure to the gate in her arms for the last time, tears—real, honest tears—dimming her blue eyes, but mentally rejoicing that the unconscious creature, now purring so contentedly in her arms, knew not the sad eternity of the separation, and thus escaped the pang which wrung her own bosom.

Then, with a last fond embrace, so ardent that the poor cat couldn't help responding with a low wail of pain (fairly squeezed out of her), Hitty placed her upon her favorite post of observation (the gate-post), and turned away forever, hastening after Mrs. Cutter, who, all regardless of this tender parting, was half-way down the lane. It was some consolation to the sorrowing child to reflect that she had made the best provision she could for the affliction of the grieving and faithful cat, by engaging their next-door neighbor, a kindly single woman, and, therefore, perhaps more amenable to the soft appeal, to have a look-out for the poor, desolated animal, and if she pined badly under the separation, to solace her woes with an occasional cup of milk; but we regret to have to say, destructive as it is to the romance of our story, that, the attachments of the feline race being rather local than personal, Morgiana never seemed to need the consolations of friendship thus provided for her; but continued to maintain her post and her flesh, perhaps the latter rather the better, from not being subjected to the daily exercise, the turnings and twistings, to which her young mistress's love had always exposed her.

Few remarks were exchanged by the ill-assorted and unloving companions during their long walk through green lanes and dusty highways to the distant station, for no sympathy had ever existed between them. The avaricious old woman, trusting to the prolonged absence of the child's natural protectors, and a prey to sinful greed, had stinted the helpless little one left in her charge in every possible way, and had devoted the ample allowance paid her quarterly for the child's use to her own enrichment; and burdened with the knowledge of the wrong thus done the unconscious girl, she had come to regard her with dread and aversion.

She had always had a terror of a final adjustment of accounts, and now she was mentally congratulating herself on her good luck that the girl had been sent for rather than reclaimed in person, for she felt that a personal interview with Judge Arnold might, and probably would, call up some inconvenient explanations, while she knew enough of his liberality from her daughter's long and well-paid service in his family to fear any future investigation from him on the score of money-matters; thus her thoughts were busy with the Past, and her tongue silent.

On the other side, Hitty (or "Belle," as we shall now call her), who had never received from her one loving look or word, had always shrunk away from her with instinctive disgust and aversion, treating her as rudely as her supposed claim upon her as her grandmother seemed to render admissible; and now busy with dreams, hopes, and wonders of all which the Future was bringing to her, was equally silent.

They reached the station, where their unusual appearance called forth some observations,

which, fortunately, they did not hear, and sat down to rest themselves and wait for the expected up train.

It came at length, and little Belle eagerly eyed every one that came up in it; but she saw no one at all answering to her expectations of what her grandfather's messenger would be like to be—indeed, it would have been difficult to find such a person in real life. A tall, stern-looking man with fierce whiskers, dressed in a single-breasted, befrogged coat buttoned up to the chin, with a cockade on his hat, a badge upon his breast, spurs upon his heels, and gold-lace and buttons sprinkled over his person *ad libitum*!—a something between an English beadle and a Yankee militia captain.

But, alas! no such person appeared; and Belle, who would now have even welcomed the handcuffs, grew wildly anxious. Presently the train started upon its onward way, and no one had appeared to claim her; and the eyes of the poor child filled with drops of mortification and bitter disappointment.

Mrs. Cutter, though secretly anxious and disappointed herself, saw the discomfort of her young companion and enjoyed it. "Come, child," she said aloud as she rose from her seat; "I guess we may as well mog home again. Ain't no use in setting here all day, as I know of. You needn't have been in such a fuss to get here airy. It's clear you ain't going to be sent for this day, any how. I guess yer gran'father ain't in sich a mighty hurry to see you as you s'posed he was. Come!"

As Mrs. Cutter spoke a well-dressed, quiet-looking woman, who had been sitting unobserved a little behind them, rose and came hastily across the room to them, saying to Mrs. Cutter as she drew near, "Excuse me. But—can I be right? Are you Mrs. Cutter?"

"Yes'm, yes'm," said Belle, pressing forward before the widow could reply, and speaking for her in quick, breathless tones—"yes'm, yes'm, she is—she's Mrs. Persis Cutter. That's her name; and I'm Belle Linzee. And are you the messenger that my grandfather Arnold wrote he would send for me?"

"Yes, my dear," said the stranger, regarding the droll little figure before her with its strange garb and eager, flushed face in evident surprise and consternation, "I am. There is a letter I was to give you, Mrs. Cutter. And now, Miss Belle, the down train will be along in two or three minutes—I am going to the door to look for it. When you have bidden your friend here 'good-by,' you will join me there, if you please."

It was evident that "grandfather's messenger" had withdrawn from motives of delicacy, not wishing to be a check upon what she doubtless expected would be a tender farewell; but Mrs. Cutter and Belle had no such intentions. A cold "good-by" from each, and a tremulous "give my love to dear old Morgee!" from Belle, terminated their last interview. And Belle re-

joined her new guardian some time before the down train appeared in sight.

As the cars came thundering up to the station-house, the messenger—for Belle knew no other name for her—took her little charge by the hand, and, entering them, took a good seat for her, and then took one for herself at some little distance from her, but where she could keep her full in view; for, to tell the truth, the well-dressed and well-trained servant was rather ashamed of the bizarre dress and rustic appearance of her young mistress.

This arrangement, by condemning the little girl to total silence, gave her time for much reflection. She had never before, since her earliest recollection, been in a steam-car, nor indeed in any vehicle of any sort beyond a farmer's market wagon, and even that was a pleasure not often enjoyed. So that this new experience would of itself have occupied all her thoughts had there been no more urgent call for them; but now she was so intent upon the future, and what it was to bring forth for her, that the present seemed to be annihilated for her, and she scarcely noticed by what mode her progress was being made.

The ride was a long one and the weather very warm, and the poor child, who could have walked or run a dozen miles without fatigue, grew cramped and weary with the unnatural constraint. But she bore it bravely, made no complaints, and asked no questions—it was her "grandfather's messenger," and she was taking her to him; and if she had been kept riding all night, the faith and hope in her brave little heart would have sustained her.

The nicely-dressed and respectable woman who had her in charge was to her an object of respect and admiration, amounting almost to awe; for she was, in dress and bearing, very far beyond any thing the child had ever seen before—a decidedly "great lady" to her; and she gave herself up to her guidance without one questioning doubt.

At last, late in the summer afternoon, they reached their place of destination—at least so far as they were to go in the cars—and the weary girl was glad to leave her seat and stretch her cramped and benumbed limbs.

"There, Miss Belle," said her conductress as they stepped from the cars—"there they are, you see, waiting for us. There is your grandpapa's carriage."

Her grandfather's carriage—hers! She who had thanked Farmer Twitchel, with a humble courtesy, for a ride in his empty hay-cart! Why, it seemed to her that the very heavens must be breaking up and falling in glory about her feet as, looking in the direction indicated by her companion, she actually saw a stylish, well-appointed family-carriage, with a pair of sleek iron-gray horses, waiting in the distance.

Remember, Belle was not a connoisseur in carriages, this being the first equipage of the kind she had ever beheld; and wonder not if she felt through all her being that the "golden

coach" in which the cat-loving Whittington was borne through the streets of "great London town," in all the full-blown honors of his lord mayoralty, was "not a circumstance" compared to this one!

Taking the hand of the girl who, between awe and weariness, walked as if in a glorious but bewildering vision, the woman led her on toward the carriage.

"There," said she; "that is Mrs. Montravers."

"And who is she?" faltered poor Belle.

"Why, she is your governess, dear! And such a nice, pleasant lady! I'm sure you will like her; you can not help it. See, she is coming to meet you." And as she spoke, a stylish and elegant woman, of commanding presence; dressed in a rich shawl, and that (to Belle) often heard of but seldom seen luxury, a silk dress, descended from the carriage, and came toward them.

"And this is Miss Belle Linzee?" she said, inquiringly, as her astonished gaze rested upon the flushed face and shrinking figure of our poor little heroine; and her first verdict was, "Good Heavens, what a little savage!"

But as she met the mild, imploring glance of the sweet blue eyes, so softly pleading and full of tenderness, her heart corrected the judgment her taste had rendered, and she said to herself, "Poor, neglected little thing!" and stooping, she gently took the little yellow, cottage-gloved hand in hers, and lightly kissed the crimson cheek. "This way, my dear," she said, and in a moment more Belle was beside her in the luxurious carriage.

As the coachman resumed his reins, and the high-stepping grays moved homeward, Mrs. Montravers looked again into the face of the little stranger by her side.

"You are very tired, my dear, are you?" she asked, kindly.

"Yes 'm; no 'm," faltered poor Belle. "I don't know 'm; I don't think I'm just tired; but I'm not used to riding—and—and my head begins to ache a good deal."

"I'm sure it does," said her pitying companion, seeing the evident exertion the child was making to control herself. "It is a long ride for you, and the day has been very warm, and I am sure you must be tired. Suppose you take off your hat, and rest your head upon my shoulder—there—so." And, suiting the kind action to the kind words, she gently removed the feathered monstrosity, and putting her arm round the now fairly sobbing girl, drew her toward her, and rested the throbbing temples on her shoulder.

"Oh dear, kind, good lady!" sobbed weary little Belle. "How very, very good you are to me! Nobody was ever so kind to me before."

"Oh," said the lady, with an encouraging smile, "you are going to be my little girl now, you know; and I hope we shall be very good friends together—you and I."

"I am sure that I shall like you," said Belle,

fervently. "There's no doubt about that; I am sure I can't help it; but I'm afraid I shall give you lots of trouble. I am such an ignorant little girl. I do not know any thing. I've never been taught to do any thing; and I do not know what to say or how to behave; but if you will try to teach me I will do just what you tell me, and love you dearly—dearly!"

"That is all I can ask of you, my dear child. But you are too tired to talk now. Sit still, and rest your poor head. We shall soon be at home now, and you shall have some tea, and go to bed; and to-morrow we will talk of all this." And the obedient girl, fairly overcome by her mental excitement and bodily fatigue, nestled down into a heavy drowse, which was neither sleep nor wakefulness, conscious only of a grand and perfect contentment.

When the carriage stopped she was so far asleep that she had to be lifted out; and as she was led on she saw as in a dream the lighted hall, the pictured walls, the richly-carpeted stairs, the beautiful and fragrant flowers upon the various landings; and enchanted castles, eastern bowers, and fairy palaces seemed more than verified. At last they paused in a small but luxurious room, and then, when some cooling lotion had been applied to her face to relieve the flush which her new friend naturally attributed to the heat of the summer day, Belle had some tea, toast, simple cake, and preserve. Very simple the repast was, but to her inexperienced taste it seemed like nectar and ambrosia! Not the far-famed

"Jelly of stars, and a dish of humming-birds' tongues,"

which old-fashioned hospitality used to covet for the delectation of its most honored guests, could have been more acceptable to her.

When this needed refreshment was over Belle was allowed to go to her luxurious chamber; and so tired was she, the unwonted services of a maid to help her undress were not rejected, or indeed scarcely noticed.

"You will not be afraid to sleep here alone, will you, my dear?" questioned the governess, kindly. "I sleep in the next room, and shall keep my door open."

"Afraid? Oh dear! no 'm." And sleepy Belle

"Laughed a laugh of merry scorn,"

as she thought of the lonely little attic, up under the roof, where she had slept alone through summer's heat and winter's cold; when the howling wintry storms beat upon the old roof, which creaked and shivered in the fierce blast, and where the rats and mice scabbled and squeaked in the decaying walls.

Mrs. Montravers lingered a moment to turn down the gas to a slumberous light, and before she left the room the little tired traveler was lost in a dreamless sleep.

In the morning Belle woke at her usual early hour, but the house seemed preternaturally still, and the windows of her room were dark-

ened with shades and curtains; and as she had no "chores," as Mrs. Cutter called her services, to perform, that she knew of, she did not venture to rise, particularly as a peep through the open door, into the other chamber, showed her her kind governess still fast asleep; so she lay still and reviewed her position.

It was strange how the sun of prosperity had already thawed the frozen soil of this little desolate heart, and called into bloom some of the sweet traits of the child's character! While with Mrs. Cutter, her love of truth and justice, her innate perception of the pure and good, and her natural and instinctive love of the beautiful, had been so outraged and disgusted by all her surroundings that in very scorn she had adopted a harsh, defiant tone, defending herself from the evils she could not conquer by opposing to them a fierce recklessness and a saucy wit; but now, in the more genial atmosphere of refinement and love, she had at once laid down her arms, and exhibited only the beautiful traits of her sweet, generous, and truthful nature; and, as she lay waiting the summons to rise, she made up her mind to be as wax in the kind hands of her governess.

After a time which seemed interminable to her, whose eagerness counted moments as hours (and when her enforced inaction had wearied her nearly as much as her journey), she heard a slight stir in the next room, then a distant bell tingled, and the stately messenger of the day before, who was, in truth, only lady's-maid, entered the next room. Mrs. Montravers spoke to her in a low voice, and coming to the door, she looked in.

"Oh! you are awake, then, Miss Belle?"

"Yes 'm."

"Mrs. Montravers sends her love and compliments to you, and says 'Good-morning' to you; and, if you please, she does not want you to rise until she comes in."

"Yes 'm."

The woman smiled at Belle's rustic politeness. "My name is Rachel," she said, suggestively, and withdrew.

Rachel! Her name was Rachel, very likely; but how could a little country girl like Belle dare to call her so—such an elegant lady, and so much older than she was too!—it seemed preposterous. Why, she might as well call the reverend Parson Stoddard, her minister, "Leander," and his wife, the minister's lady, "Eunice Irene!"—what fearful profanation! She grew red to think of it.

Soon Mrs. Montravers and Rachel came into the room, and Belle's toilet was begun. The cooling wash of the night before had removed "the flush of victory" which had followed the forcible extermination of the hated freckles and tan, and rested by a long night's sleep, and refreshed by her luxurious morning bath, she was fresh as a rose, and stood revealed in the fair and brilliant red and white which make youth so beautiful.

It was evident that her coming had been an-

ticipated, and her wants provided for: money, taste, and judgment had been freely expended; ready, skillful hands had been at work; and articles of luxury and beauty seemed springing up for her use on every hand. The delicate French boots, the silken stockings, the rich lace, the embroidery and fine linen, to which other girls of her rank are accustomed from infancy, and which from long use seem scarcely any luxuries at all to them, were all, to her inexperienced eyes and keen perception of the beautiful, objects of real enjoyment; but the watchful governess saw with pleasure that no personal vanity had any part in her delight. It was the beauty of each article in itself, not its effect upon hers, which she seemed to rejoice in.

"And now, Miss Belle," said Rachel, "you will sit down, if you please, and let me arrange your hair." And the obedient girl seated herself at once.

"What magnificent hair!" said the admiring operator, as, having removed the yellow strings and untwisted the stiff braids, she saw the rich masses of red gold fall shimmering through her hand.

"What, my red stuff?" asked Belle, looking up in unaffected wonder. (Belle did not know how the edicts of mighty Fashion had glorified the once-despised hue.) "Why, I always think it is awful! Mrs. Cutter said it was hateful, and if I did not take care it would burn the house up! I have cut it off close to my head two or three times; but it was of no use, it only grew all the thicker and curled all the tighter, so I just let it alone, and let it grow."

"I am very glad you did, my dear," said the smiling governess, who was superintending this first toilet.

"The red stuff" was in skillful hands now, however. A careful brushing and a tasteful adjustment by fingers fully competent to their task, and the shining masses, drawn away from the brow in the waving lines of beauty, fell in a profusion of loose curls over the girl's plump white shoulders and round arms.

A simple white robe of delicate material and tasteful fashion, and a lustrous blue silk sash, completed the dress, and the two officiating priestesses exchanged delighted glances at the result of their labors, as Belle took the offered hand of her governess and turned from the room without one glance into the tall mirror which seemed to stand waiting for her.

At every turn on the stairs she stopped in wonder and admiration of the exquisite flowering plants, and inhaled their sweet odors with exclamations of delight.

As they reached the drawing-room door, Mrs. Montravers stopped to speak to a servant, and signed to Belle to enter alone. As she walked up the spacious and elegant room, almost in awe at all the splendors surrounding her, a young and beautiful girl, about her own age, advanced from the adjoining room to meet her. Belle was unprepared for this; she turned hastily

back, and, shy and trembling, regained the hand of her friend.

"Who is that?" she asked, in a low, breathless whisper.

"Who, my dear?"

"That beautiful young lady in the other room. Is she my sister? Does she live here?"

"Yes, my dear," said Mrs. Montravers, smiling; that is the young lady of the house. Come, and let me introduce you to her." And she led Belle, blushing and shy, and half afraid to look up, directly before the great mirror before she discovered her mistake.

"Why, is it me?" she said, when the truth revealed itself to her. "Am I so pretty as that? Oh! my dear friend, what have you done to me? You have really made me look like a young lady. How did you do it?"

"You are a young lady, my dear Belle; you were born a young lady, and I trust you will always behave like one; but now come into the other room, and we will have our breakfast."

After breakfast Mrs. Montravers took Belle through the rooms, and pointed out to her the pictures and statuary.

The pictures of her father and mother, taken soon after marriage, moved her to tears of filial tenderness, and she returned to them again and again in loving interest.

"Mrs. Cutter told me," she said, in a tearful voice, "that my father died by some accident, she couldn't tell me what. Can you tell me?"

"Yes, my dear. I have heard that your parents were riding out, when their horses took fright and ran, and your father was thrown out and instantly killed; but this, of course, was years ago, before I knew any thing of the family."

Belle's lips trembled to ask about her mother, but the swelling tears prevented her. Her governess had already told her that her grandfather was still at some watering-place, and would not probably reach home under another week; at which the child was half sorry, half glad, for she felt she had time for improvement before his return; and to be what he would wish her to be was the one great object of her ambition.

The next day Mrs. Montravers took her out for a long drive; and on their return the elder lady went up to change her dress, but little Belle, seeing some new flowers which the gardener had just arranged on the piazza, flung off her hat and stopped to admire them. She had been bending with clasped hands and delighted eyes, lost in the contemplation of a beautiful tuberoses, when, as she turned hastily away (with one of her old sudden motions), she turned nearly into the arms of a fine-looking, middle-aged gentleman, who had been standing silently observing her, with quite as much admiration as she had accorded to the flowers.

Now, Belle's ideas of her grandfather's personal appearance had naturally, but unconsciously, been formed upon the model of Deacon Josh Cutter's profile over the chimney-

piece; and comprised, of course, as its component parts—old age, a wig, a queue, a ruffebosomed shirt, and a bottle nose; modified, of course, in the individual. And it never occurred to her that the elegantly dressed and handsome man before her, deficient in all these important particulars, could be her grandfather.

"I beg your pardon, Sir," she said, retreating hurriedly, but blushing and beautiful in her timid confusion.

"Mabel Arnold! her very self, I protest!" said the gentleman, gazing at her in wondering admiration.

"Oh no, Sir!" said the child, gently and gravely; "that was my dear mother; I am only Belle Linzee. If you will walk into the drawing-room, if you please, I will call Mrs. Montravers; my grandfather has not come yet."

"Your grandfather has come, you little angel! and you did not know him," said the gentleman, catching her in his arms. "My darling! my darling! Why! you are your mother over again. I declare! I scarcely know if it is Mabel or Belle; whether you are my child, or grandchild."

"Let me be both to you, dear grandfather!" said Belle, caressingly, twining her arms round his neck, and pressing her soft cheek to his.

"No, no, my pet!" said the delighted parent; "don't aim at too much. I think I can love you quite enough as my grandchild; but I forget, you have not seen your mother yet."

"Oh yes; indeed I have!" said Belle, in trembling tones, while tears dimmed the soft lustre of her eyes. "I go and stand before her sweet picture very, very often."

"Her picture? Nonsense! Come here!" and he threw open the drawing-room door.

Belle saw a slight, graceful figure, in widow's weeds, standing with clasped hands before the picture of Howard Linzee.

"Mabel!" shouted the happy grandfather. "See here! Our Belle—" and in another instant the one deep longing of Belle's heart was gratified. She was clasped in the arms of her mother, and her cup of earthly happiness had sparkled to the brim.

THE RUNNING TURF IN AMERICA.

[First Paper.]

IT is traditional, if not a well-authenticated fact, that horse-racing was known in America prior to the defeat of General Braddock, in 1753. Virginia and Maryland were the places where first the people began to think about developing the speed of the horse. In that early period quarter-racing was most in vogue, and it is safe to assert that sport, rather than the improvement of the equine, was the incentive to action. Fearnought, imported into Virginia in March, 1764, was regarded as the Godolphin Arabian of America. If we may believe the old chronicles, he certainly was a superior horse. He was a bay, 15 hands 2½ inches high, and

was foaled in 1755, being bred by Mr. Warren. He was got by Regulus, and his dam Silvertail, a mare descended from the Darley Arabian. Fearnought was bred to the best mares in the country, and the result was a better class of horses than had formerly been seen on this side of the Atlantic.

But Jolly Roger had left his impress upon the stock of Virginia prior to the importation of Fearnought. He was a chestnut, got by Roundhead, and out of a sister to Wilkie mare by Croft's Partner. His seventh dam was the Burton Barb mare. He was foaled in 1741, and brought to this country by Mr. Craddock. He died in Greenville County, Virginia, in 1772, aged thirty-one years, leaving speedy but not over-stout sons and daughters. Janus, by Old Janus, the latter a son of the Godolphin Arabian, was imported into Virginia in 1752, and did good service in the stud. Both Janus and Jolly Roger are entitled to much credit when we come to trace the history of the blood-horse of America. They are the first links in the chain which binds the present to the past. They sowed seed which has brought forth good fruit. Their blood mingled with coarser currents, and gave a shade of purity and richness to these currents. So when Fearnought made his appearance in Virginia—came from the Old to the New World with the pride of aristocratic lineage—he was not called upon to dissipate his powers through unknown channels. There was a base to work upon, for Janus and Jolly Roger had not lived in vain. Many of their immediate descendants had reached the age of maturity, and they were prepared to receive, blend with their own, and perpetuate the blood of the son of Regulus.

Fearnought conferred stoutness and qualities of endurance upon his stock, which led to trials of speed at longer distances than had been the fashion before. Mares of pure blood were also imported from England, among which was the celebrated Cub mare, the dam of Slamerkin; and breeding was carried on with great success in the Old Dominion until it was interrupted by the war of the Revolution. After the war new importations were made, among which may be mentioned as the most celebrated the stallions Medley and Messenger. From Virginia the blood and racing fever extended into Maryland, and then into the Carolinas. Charleston for many years was a great racing centre. Horses were matched against each other as far back as 1734; but the contests were not of a character to exercise much influence upon the problem of breeding, if, indeed, at that time breeding was regarded in the light of a problem.

The Newmarket Course was inaugurated at Charleston, February 19, 1760, under the management of Mr. Thomas Nightingale, a Yorkshire man by birth. Several other courses were opened in different parts of South Carolina, and racing became something of a popular pastime, though the sports were what in this modern

day we would forcibly, if not elegantly, denominate the scrub order.

About 1772, Flimnap, a bay stallion by South out of a Cygnet mare—Cygnet by the Godolphin Arabian—was imported into South Carolina by Mr. Mansell. He was quite a celebrity in his day, and his blood served to enrich our stock. Though small, being but fourteen hands and a half inch high, he was strong and hardy. Josiah Quincy, who visited Charleston in 1773, made a brief note in his journal: "March 3.—Spent day in viewing horses, riding over the town, and receiving complimentary visits." "March 16.—Spent the morning, ever since five o'clock, in perusing public records of the Province, etc., etc.; am now going to the famous races. The races were well performed; but Flimnap beat Little David (who had won the last sixteen races) out and out. The last heat the former distanced the latter. The first four-mile heat was performed in eight minutes and seventeen seconds, being four miles. £2000 were won and lost at this race, and Flimnap sold at public vendue the same day for £300 sterling. At the races I saw a fine collection of excellent though very high-priced horses, and was let a little into the singular art and mystery of the turf."

When South Carolina was invaded by the soldiers of Lord Cornwallis, frequent attempts were made to secure from the farm of Major Harleston Flimnap as a prize, for the fame of the horse had spread throughout the two armies. But all efforts to get possession of the stallion proved unsuccessful. Flimnap eventually was sent into North Carolina, where he remained until the British soldiers were withdrawn from the other Carolina. And to this day many of the pedigrees of the best horses of America trace back to this small but hardy son of South and the Cygnet mare.

When the war closed a new impulse was given to the sports of the turf. Among the gentlemen from South Carolina who now took an active interest in racing were General Hampton, Colonel Alston, Colonel Washington, Colonel M'Pherson, Major Thompson, Mr. Sumter, Mr. Fenwick, Mr. Wigfall, Mr. William Moultrie, and Mr. Singleton. The season of 1786 opened brilliantly at the Newmarket Course. The turf became the fashionable amusement of the hour, and the era that then and there dawned is referred to as "a golden age of racing" in the State of South Carolina. A chronicler of that period writes enthusiastically of the gatherings on the Newmarket Course: "Whether we consider the elevated character of the gentlemen of the turf; the attraction that the races possessed at that time, and for many subsequent years, for all sorts and conditions of men—youth anticipating its delights for weeks beforehand, the sternness of age relaxing by their approach, lovers becoming more ardent, and young damsels setting their caps with greater taste and dexterity—the *quality* of the company in at-

tendance; the splendid equipages; the liveried outriders that were to be seen daily on the course; the gentlemen attending the races in fashionably London made clothes, *buckskin breeches, and top-boots*; the universal interest pervading all classes, from the judge upon the bench to the little school-boy with his sachel on his back; the kind greetings of the town and country; the happy meetings of old friends whose residences were at a distance, affording occasions of happy intercourse and festivity; the marked absence of all *care*, except the *care* of the horses; the total disregard of the value of time, except by the competitors of the races, who did their best to save and economize it—every thing combined to render race-week in Charleston emphatically the *carnival* of the State, when it was *unpopular*, if not *impossible*, to be out of spirits, and not to mingle with the gay throng.”

The picture is a glowing one, but it is not complete until we add that clergymen and learned judges sat side by side when the horses were running, taking a deep interest in the contest and the animated scene around them. We see much of the style and good feeling described at Jerome Park on gala days; but the fashions have slightly changed between 1786 and this year of grace 1870. Instead of gentlemen appearing on the course in tight breeches and top-boots, they introduce their servants to the gaping crowd in this peculiar garb.

The history of the Newmarket Course closes with the year 1791, for in 1792 the South Carolina Jockey Club took possession of the Washington Course, the following gentlemen being the original proprietors: General C. C. Pinckney, General Washington, O'Brien Smith, John Wilson, James Ladson, William Alston, H. M. Rutledge, Gabriel Manigault, General Reed, Colonel Mitchell, General Wade Hampton, James Burn, Captain White, L. Campbell, William Moultrie, General M'Pherson, Colonel M'Pherson, Colonel Morris, E. Fenwick, and William M'Cleod.

The Jockey Club increased in strength as the years went by; and, up to the breaking out of the war caused by the firing on Fort Sumter, the history of the Washington Course was a history of uninterrupted success. The races were the fashionable event of the year, and the race-week was one of gayety and royal display. But one meeting was held each year, always commencing on the first Wednesday in February and continuing throughout the week. On Wednesday the Jockey Club gave their annual dinner—a dinner which brought together all the choice, convivial spirits of the State; and Friday evening was set apart for the great Jockey Club ball. No expense was spared in the effort to make this ball *the* social event of the season, and success always attended the effort. Bright, very bright is the picture; but the brightness faded when Beauregard rallied the people around his standard and rode forth to battle. Charleston suffered terribly, as we all know, by

the war; and now the glory of the South Carolina Jockey Club and the Washington Course is a feature of the past. We understand, however, that Dr. John B. Irving, the former secretary of the club, has been making an effort to reorganize the shattered forces, with the hope of inaugurating a new turf era at Charleston in the autumn of 1870.

Immediately subsequent to the Revolution racing stables were established in Virginia and Maryland, as well as in South Carolina. Among the early patrons of the turf in Virginia were Colonel John Tayloe and the Messrs. Hoomes, Selden, and Johnson. Upon the turf roll of Maryland we find the names of Governors Ogle, Ridgely, Wright, Lloyd, and Sprigg. Racing has been truly named the “sport of kings;” and wherever it has flourished in America it has received the support of our wealthiest citizens and most eminent men. More than eighty years ago race-courses were established at Petersburg and Richmond. When the two quarter nags, Twigg and Polly Williams, were rivals, and engaged in frequent battles, owing to the absence of currency, tobacco was freely wagered upon the races, sometimes as much as one hundred thousand pounds depending upon a single contest.

Although we can trace racing back to the very infancy of our history, the turf was not conducted on a systematic plan until about the year 1815; at least, records of running prior to this date are not authentic. The people of New York, like those of the more southern States, indulged in racing before they even dreamed of going to war with Great Britain; but there was little organization, and the result of each contest was not officially recorded. Mr. Herbert, better known as “Frank Forester,” expressed himself very emphatically upon this subject. “To draw a parallel, as nearly as I can draw one,” he wrote, “I regard the old Virginia turf, prior to the fifteenth year, at least, of the nineteenth century, as neither more nor less authentic than that of England up to the time of English Eclipse; and I consider that the era of the importation and covering of Diomed and Messenger in the United States as parallel to that of O'Kelly's wonderful stallion in the Old Country. From the day when the sons and daughters of these noble animals began to run upon the turfs of England and the tracks of America, all is plain and on record, so that who runs may read.”

American Eclipse, got by Duroc out of Miller's Damsel, by Messenger, was foaled at Dozon's, Queens County, Long Island, May 25, 1814, just one year in advance of that from which Mr. Herbert dates the authentic era of the turf in this country. And this bright era of the turf did not close until about the year 1845. The South met the North in wholesome rivalry, and the fruits of the rivalry, conducted under such men as Johnson, Tayloe, Van Mater, Wade Hampton, Bingaman, Stevens, Livingston, Stockton, Jones, and Gibbons, were ap-

parent in the wide dissemination of blood, and the improvement of the thorough-bred horse. Long Island was the chosen battle-ground of the champions, and year after year the tracks there resounded with the drum roll of feet.

Our limits will not allow us to trace the history of the blood-horse, link by link, from the earliest times down to the present. Volumes are required to make the annals of the turf complete. We make pretension to only a glance at the history of racing, desiring to show the vitality of the sport, and the prominence it has enjoyed.

There were race meetings in the vicinity of New York anterior to 1819; but it was not until that year that the people of Gotham seemed to take a lively interest in the transactions of the turf. In 1819 an association was formed, and a course established at Bath, Long Island; but the location was not most desirable, and in 1821 the same association purchased a plot of ground eight miles from Brooklyn, and inaugurated it as the Union Course. Large purses were now offered for speed contests, and racing was established on a respectable and firm basis. The Union Course stands prominently on the page of history, since it was the theatre of some of the grandest turf battles ever decided on American soil. The great race between Henry and American Eclipse, if no other had been run on the track in Queens County, would have given an enduring fame to the Union Course. The racing career of American Eclipse had been one series of brilliant successes. He was a Northern-bred horse, and as such was the rival of Southern studs. The turfmen of Virginia, Maryland, and South Carolina regarded him with envy, and they sought to defeat, if not to disgrace him. In 1822, so great was his fame, and so feverish the racing pulse, that the gentlemen of the South made a bold effort to humble Northern pride. Mr. James J. Harrison, of Brunswick, Virginia, challenged Mr. Van Ranst to run his horse American Eclipse against Sir Charles, over the Washington Course at Charleston, four-mile heats. The challenge was promptly accepted, each gentleman staking \$5000 on his horse, and fixing the 20th day of November for the race. Sir Charles having met with an accident, Mr. Harrison was obliged to pay forfeit; but he offered to run his horse a single four-mile heat against Eclipse, for \$1500 a side. This offer was accepted by Mr. Van Ranst; the horses were prepared for the race, and the Northern champion achieved an easy victory, Sir Charles breaking down on the last mile.

The South felt humiliated; and in the evening of the same day, that Napoleon of the turf, William R. Johnson, Esq., of Petersburg, Virginia, pledged himself to produce a horse, on the last Tuesday in May, 1823, to run four-mile heats against Eclipse over the Union Course, Long Island, for \$20,000, \$3000 forfeit. On the part of several gentlemen from the North this challenge was promptly accepted by Mr. John C. Stephens. Such, in brief, are the

facts which led to the most exciting race ever run on this continent.

Throughout the long winter nights the proposed match was the subject of earnest discussion and speculation; the North was pitted against the South, and the event aroused sectional prejudices and appealed to sectional pride. A battle between two great armies could not have excited deeper anxiety than this race between Henry and Eclipse. The 27th day of May, 1823, dawned in beauty, and by twelve o'clock it is estimated that not less than sixty thousand people had assembled at the Union Course. The Southern party had brought five horses with them; and from this five, Henry, a son of Sir Archy, and out of a mare by the great Diomed, was selected as the competitor of Eclipse. John Richards, a four-year-old, was Colonel Johnson's favorite, and Henry his second choice; but the former having fallen lame, the fortunes of the Southern gentlemen were staked upon the latter. The race was run amidst the wildest enthusiasm—Henry winning the first heat by half a length. Mr. Purdy, an experienced jockey, and one who had piloted Eclipse to many victories, changed places in the saddle with Crofts for the second heat; and when it was observed that Purdy was astride the son of Duroc, we are told that Northern hope revived. Eclipse was a horse that required punishment to force him to his speed; though not so fleet of foot as Henry, he was a horse of great stoutness, and it was this stoutness which made him invincible in a four-mile struggle. Purdy understood this fact full well; and when they received the word for the second heat he drove the chestnut forward, giving Henry no respite. The tactics were good, and they won the second heat.

At this stage of the battle the excitement was most intense, for a heat had been placed to the credit of each contestant. One more struggle, and the race would be over, and victory would perch either upon the banner of the North or that of the South. A few fleeting minutes, and the pride of one section would be exalted, while the hopes of the other section would be blasted. Thousands trembled in the balance; and not thousands only, but the glory of victory or the shame of defeat. Arthur Taylor, a skillful rider and a trainer of experience, mounted Henry for the third heat, the boy Walden not having ridden him with sufficient tact in the former heat to receive the admiration of the backers of the son of Sir Archy. Purdy took the lead at the start, and making good use of his whip and spurs, kept Eclipse hard at work throughout the four miles. Henry made a gallant struggle for the front, but the hardy champion of the North could not be passed; and Henry was too weak, in the last half-mile of the race, to astonish the multitude with one of his marvelous flights of speed down the home-stretch. He lost the race, and the North was exultant; while Southern hearts felt sore, and Southern pride was humbled.

Over two hundred thousand dollars changed hands at the Union Course on that 27th day of May, 1823. And that night mail packets and mail couriers carried the news south, north, and west from New York. In every country town the people gathered in great numbers, hours before the courier could possibly arrive, in eager anticipation of the news. The race created national interest, and it was regarded as a contest of national importance.

Those were the palmy days of the turf, and the Union Course was then in the zenith of its fame. General Ridgely of Baltimore, Captain Cox of Washington, and John Allen, Esq., of Philadelphia, were the judges of the race; and they reported that the first heat was run in 7 minutes 37½ seconds, the second heat in 7 minutes 49 seconds, and the third in 8 minutes 24 seconds; thus making the aggregate time 23 minutes 50½ seconds, which is equivalent to an average of about one mile in 1 minute 59 seconds. American Eclipse, as an aged horse, being nine years old in the spring of 1823, carried 126 pounds, while Henry was burdened with 108 pounds; the advantage in weight clearly being on the side of the former, since the latter was his junior by five years. This great four-mile match led to much speculation before it was decided on Long Island soil in the presence of a vast multitude of people; and after the race the history of the struggle led to almost endless discussion—a discussion which is kept up even until this day. It is maintained by one party that had Purdy been in the saddle from the start Henry would not have won the first heat, and that eight miles instead of twelve would have finished the race. Another party insist that Eclipse would have been defeated had Colonel Johnson been on the ground to direct the running of the race. They argue that Henry was badly managed in the second heat, and that this bad management lost him the race. Both sides are plausibly argued, and we simply mention the fact without presuming to decide the controversy. Certainly, the Southern gentlemen maintained confidence in the son of Sir Archy in spite of his defeat; for they offered to make a new match, Henry to run a race of four-mile heats against American Eclipse, in the fall of 1823, for any sum from twenty to fifty thousand dollars—a proposition which was firmly declined by the Northern party. The Virginians were of the opinion that the absence of Colonel Johnson from the Union Course on the 27th of May was the main cause of Henry's defeat; and this opinion was strengthened when the Eclipse party declined to enter into a second match.

But why was the Napoleon absent on that eventful day? Ay, why? Simply because he was too weak to resist temptation. He attended a supper-party the night before the race, met convivial friends, and wine and lobsters made him a helpless invalid when his strength should have been greatest, his nerves calmest, and his intellect most unclouded. That brilliant but

eccentric man, Hon. John Randolph, of Roanoke, witnessed the race between the champions, and he was the author of the since often quoted remark, "It was not Eclipse, but the lobsters, that beat Henry." Apropos of Randolph, the Virginia statesman was a careful breeder, and one of the most devoted patrons of the turf. His horses were usually trained and run by his friend, W. R. Johnson. Randolph's peculiarities and sarcastic tongue made him enemies on the turf, as well as in political circles. Although he provoked the distinguished Kentuckian, Henry Clay, a patron of the turf, like himself, to stand face to face with him in a duelistic encounter solely that he might gratify his inordinate greed of notoriety, we can not forget how chivalrously he received Clay's fire. This duel made him the warm friend of the sage of Ashland; and when Randolph, weak and dying, visited the Senate chamber for the last time, his soul shone out in all its true nobility, and he paid a touching and beautiful tribute to the oratorical powers of the great Kentuckian, in asking to be raised up from the sofa in order that he might for the last time on earth hear Henry Clay speak. These were his words: "Raise me up; I wish to listen to that voice once more." Beautiful, are they not, especially when we think of them in connection with the arrogance of the patrician representative from Virginia to Speaker Clay in the winter of 1815-16?

The game qualities of American Eclipse were transmitted by him to his descendants. His daughter Ariel was one of the greatest racers ever on the turf. In her memorable career she run fifty-seven races, aggregating 345 miles, and was a winner forty-two times. She was bred in 1822 at Flatbush, Long Island; her dam was by Financier, her grandam Empress by imported Baronet, and her great-grandam by imported Messenger. She was a very handsome mare, a gray, of good proportions, fine action, and about fifteen hands high. Her greatest race, or at least the one which attracted the most attention, was with General William Wynn's bay mare Flirtilla by Sir Archy, dam by Robin Redbreast. When it was announced that the Northern mare Ariel was matched against the Southern mare Flirtilla, a race of three-mile heats, for \$20,000, an enthusiasm was awakened in the two sections surpassed only by the great conflict between Henry and Eclipse. The same strains of blood were brought together, for Flirtilla was the half-sister of Henry, and Ariel the daughter of Eclipse.

The race was run on the Union Course, October 31, 1825, in the presence of the largest turf-gathering on Long Island since the battle fought by the two chestnuts on that never-to-be-forgotten 27th day of May. Ariel was but three years old, while Flirtilla was five; so the advantage of age this time was on the side of the South. Colonel Johnson trained Flirtilla, and he directed her running in the match, having learned prudence, and to avoid lobster sup-

pers on the eve of battle. Ariel won the first heat, and Flirtilla the second and third, thus retrieving the honor of the South.

The time of the running in this race was very good, both of the animals exhibiting qualities of speed and endurance—qualities that challenge the admiration of the turfman, and qualities that the breeder always aims to combine. Famous as a racer, Ariel was next to a failure in the breeding stud. Her first colt was foaled in 1832; it was a filly, and strongly inbred, the gray mare having been bred back to her own sire, American Eclipse. Ariel produced two other colts, but none of them ever achieved much of a reputation on the turf.

It is thought by many who have given serious study to the problem that a long and trying career as a racer renders a mare unfit for the breeding stud. The course of training is very severe, and, if it is kept up for a series of years, it is claimed that it has an injurious effect upon the reproductive powers. Be the argument true or not, certain it is that the produce of many of our most celebrated race-mares have failed to reflect honor upon their dams. Mary Randolph, a gray mare of excellent breeding, sixteen hands high, got by Gohanna, a son of Sir Archy, foaled in March, 1829, was a brilliant performer on the turf; but in the stud she was a total failure. She ran in nothing but heat races, and in all she had to struggle to win. For two years the strain upon her nervous system was kept up, and when she was retired from the turf the glory of her life was at an end. She replenished the earth with the fruit of her womb; but not one of her offspring was worthy to wear the crown that she had won for herself. Fashion, the chestnut mare, the daughter of imported Trustee and Bonnets o' Blue, by Sir Charles—she who astonished the world by her gameness and marvelous speed—was on the turf for about ten years, during which time she ran many hard races, but did not give satisfaction as a brood-mare. Her first three colts were worthless—a fact that may partially be accounted for on the theory that consanguinity of blood impairs constitutional vigor; for Fashion, for three successive years, was bred to Mariner, her half-brother. Her fourth foal, Young Fashion, by imported Monarch, proved a good brood-mare, but was not highly successful as a racer. Her eighth colt, Dangerous, by imported Bonnie Scotland, was a successful turf horse—was dangerous not simply in name, but on the field of battle.

Facts, we see, are somewhat conflicting; but without going to the extreme that Mr. Blenkirn, an eminent English breeder, goes, who has frequently said that he would rather have the sister of a Derby winner for a brood-mare than the Derby winner herself, we may safely claim that a long and arduous career on the turf is calculated to weaken rather than improve the breeding powers of an animal. And when the life of the reproductive powers has been temporarily impaired by the ordeal of training, rest and the act of generation for two or three succeeding

years seem to restore wasted or restricted vitality. Alice Corneal, the dam of the immortal Lexington, came of good racing blood, and was a fine race-mare herself; but owing to her bad temper, when at the post waiting for the tap of the drum, she was early withdrawn from the turf. She passed through no exhausting ordeal as a racer, and as a brood-mare she was a success. But Lexington was her fifth foal. Reel, the dam of Lecompte, Prioreess, and Stark; and Picayune, the dam of Doubloon, Lou Dore, etc., were promising racers in their early forms; but breaking down young, and going into the stud, they were made famous through their descendants. Had neither met with an accident, we question not but that both would have won laurels on the race-course, and possibly would have failed to make reputations as brood-mares. These facts do not stamp the turf as an agency injurious to horse-flesh; but they impress upon us the importance of practicing moderation in racing, as we are required to be moderate in all things.

Whether or not any one of the sixty thousand people who thronged Union Course on the day that Henry was pitted against Eclipse, in the hour of wild excitement, saw visions of future greatness through the union of the blood of the two champions, it would be idle to guess. But the currents did flow together, and the result was a marvel, named Black Maria. This mare was bred by Henry Hall, of Harlem, New York; was foaled June 15, 1826. She was got by American Eclipse, and her dam was the celebrated Lady Lightfoot, by Sir Archy; and Sir Archy, the reader will not forget, was the sire of Henry. Two days after Black Maria opened her young eyes upon this fair earth she was left motherless, Lady Lightfoot dying from the effects of a violent cold. The handsome black filly developed into a grand racing-mare. She was on the turf six years, during which time she started twenty-five times, and won thirteen races. Eleven of her contests were three and four mile heats. Her purse winnings alone amounted to nearly \$15,000.

Her most memorable race was for the Jockey Club purse of \$600, four-mile heats, over the Union Course, Saturday, October 13, 1832. Four started—Lady Relief, Slim, by Flying Childers, Black Maria, and the nonpareil Trifle. Black Maria won the first heat, made a dead heat with Trifle for the second; the third heat was taken by Trifle, the fourth by Lady Relief, and the fifth and race by the dashing daughter of Eclipse and Lady Lightfoot. The track was heavy, and yet, to achieve a victory, twenty miles had to be run.

We wonder if there is a horse on the turf to-day that could stand up under such a performance as this? We fear not; for, unfortunately, the English dash system of racing has become too popular on this side of the Atlantic for the good of our stock. We have learned to look too much for speed, and to pay too little attention to the more valuable quality of

endurance. The speedy horse, without lasting powers, is simply ornamental. The horse that can go fast and long is not only ornamental but useful. He is of some practical account, even when no longer able to carry the colors to the front, when opposed by younger and more nimble companions. It is a sad commentary upon our system of racing when a purse for a contest of four miles—a four-mile dash, not heats, please bear in mind—fails to secure a run worthy of the name of race.

In the age of such renowned racers as Timoleon, Florizel, Maid of the Oaks—the ancestors of Eclipse, Medoc, Boston, and Lexington—the age of Oscar, First Consul, Hickory, Sir Archy, Duroc, and Miller's Damsel, Washington had her race-course, and it was the arena of many brilliant exploits. Gentlemen of education, position, opulence, were the patrons of the turf, and many drove out in coaches-and-four to witness the games.

The Washington city race-course was laid out in 1802, on the Holmead Farm, about two miles north of the President's house. It was managed by a jockey club composed of the leading citizens of the capital, Colonel Tayloe for a number of years being the president of the club. Among the most distinguished members of the club was Hon. Gabriel Duvall, Judge of the United States Supreme Court, by the appointment of President Madison. Judge Duvall, after his retirement from office, being then an old man, was in the habit of riding on horseback from his residence, a distance of twelve miles, to the National Course, witnessing the races, and then returning home in the saddle. He must have been vigorous in his age to have found pleasure in such a journey as this.

Mr. Tayloe is authority for an amusing anecdote affecting the Judge: Duvall and his friend Giles were members of Congress when that body sat in Philadelphia, and both were boarders of Mrs. G——, whose daughter was neither young nor taciturn. The two members of Congress were accustomed, when conversing by themselves, to speak lightly of the talkative maiden lady. In after-years Duvall and Giles met in Washington, one as the Comptroller of the Treasury under President Madison, the other the great debater in the Senate, when the latter inquired of the former, "What has become of that d—d cackling old maid, Jenny G——?" "She is Mrs. Duvall, Sir," was the surprising and stately reply.

The National Course was often graced by the Presidents, from Jefferson down to Van Buren. General Jackson took the liveliest interest in the races. He once started one of his colts on this course, entered in the name of his private secretary, Major Donelson, but was much chagrined to suffer defeat by Commodore Stockton's imported Langford. John Quincy Adams was also fond of the sports of the turf. One time he walked out to the course from the Presidential mansion, saw the race decided, and then walked back again. This was in the

most glorious era of the turf, when the wealth and fashion of the city rolled to and from the races in equipages that reminded the traveler of the royal displays of Europe. Possibly Mr. Adams, occupying the highest office within the gift of the nation, sought to set an example of republican simplicity by trudging along quietly on foot when others dashed by in their carriages, each aiming to outshine his or her neighbor with costly and gorgeous trappings.

The second epoch of the National Course at Washington was from the year 1822 up to about 1844. During this period the course resounded with the footfalls of such horses as Eclipse, Sir Charles, Boston, Blue Dick, Fashion, and Revenue. As at Charleston, so at Washington there were Jockey Club dinners and Jockey Club balls, attended by the beauty and fashion of the land. The last president of the club was Governor Samuel Sprigg, of Maryland. In 1844 the prosperity of the turf at Washington began to decline; and in 1846, after a few sickly, spasmodic efforts to inaugurate a fresh era, racing was abandoned on the National Course. The men, like the horses, who gave to it its renown are now sleeping in their graves, and we remember its glory as only a dream of the past. Since the war one or two attempts have been made to revive racing at the city of Washington, but each attempt proved abortive. The right kind of men have not taken hold of the matter, and it is not surprising that failure should attend their efforts. The turf is a pastime depending for support upon the purest, and, at the same time, the wealthiest, men of the country. It is an expensive amusement, requiring a heavy outlay of money to keep up a racing-stable. And as the sport is so open to question, men of honor and position must be its chief directors, in order that the character of the sport may be colored by the character of the gentlemen connected with it. Racing is not knavish, in the abstract; but, unfortunately, the knaves too often make it the medium of carrying out their knavish designs upon the public. When men of position and integrity are at the head of the turf, the pastime is the noblest in the world; but in the hands of sharpers it is the most corrupt institution that ever blackened the age of civilization.

WAMPUNSUNG GAP.

YESTERDAY I stumbled upon some news of Wampunsung Gap. It appears that the mining interest there is looking up, and that during the late season there was a wonderful yield of pure ore. I didn't so much mind the prosperous condition of the place, although it has my good wishes always, but the name touched me a little, and brought back a throng of memories. Wampunsung Gap! I cut the paragraph out, and sent it to some friends of mine, who will look upon it with interest; then I indulged in a little retrospection. It seems only the other day that Dolph got back from

college, and I stood looking at him with amazement—such a great, glorious Apollo as he had ripened into! such hair and eyes! Such a straight nose, and wonderful white teeth! It seemed something to be thankful for, to have been able to help such a magnificent fellow in any way; and from calling him my half-brother, I took to dubbing him with the full kinship. He was my father's son, born to him late in life by the fair young creature who spent her last breath in bringing Dolph into the world. Father shortly after sickened and died; and it was long before I could forgive the young urchin for being the cause of all this woe in the household. But poverty is an excellent tonic; and the wolf almost stood at the door when the two great gloomy bills were settled. I couldn't even afford the luxury of grief. But it was a great thing to be able to step into my father's shoes—I don't say I filled them as well as he, nor do I think I shuffled along as easily. It was tough work at times; I got grizzled and gaunt, and stiff and angular; and the Polyphemia Merivale that looked at me in the glass wasn't very pleasing to the eye.

But then, I had managed to scrape through all these years. Youth, troublesome and wayward—unreasonable, yearning youth was safely behind me, and here was Dolph, a great, handsome fellow home from college.

"I've brought home Teddy Delaney with me, Polly," said Adolphus; "he's my best friend, and a capital fellow in every way."

"Any friend of my brother's is heartily welcome," I said, holding out to him my hand. Teddy made a great salaam, and we all went out to supper, where Teddy and I fell into a strain of unconscious adulation, and let fall a great many admiring words of the young gentleman who did the honors of my poor little home so gracefully.

Shortly this adulation became a habit, and Adolphus accepted it as his due; so that, when it was withheld from him, he, in a measure, took umbrage. After he had spent three months in the coal business, six in real estate, a year in a government office, and then began to talk of going out to Wampunsung Gap, the fact dawned upon me that this brother of mine was a little vacillating.

"Better stay where you are," I said. "A rolling stone gathers no moss."

"And 'the ganging foot is aye getting,'" rejoined Adolphus. "I'm sick of hanging around home. A fellow with an adventurous turn of mind can't stand it. It'll do very well for Teddy; he likes it."

"Small blame to him," said Teddy, scribbling away for dear life. I can see the lad now, with his handsome, ugly face—a face that only a few could see much beauty in; but those few, having discerned the charm, found it irresistible. His mop of reddish-brown hair hanging down about his neck; his projecting forehead, full of suggestive bumps; his nondescript of a nose; and his great, gray, womanish eyes!

I can see him at the old table, scribbling away with his little nervous hand, jotting down in a most abominable caligraphy the pleasant and pretty fancies with which his brain was teeming. For Teddy was a great help and comfort to me. When I finished one of my stiff, pungent articles—forcible perhaps, and to the point, but sadly lacking in eloquence and feeling—I handed it over to Teddy, and lo! with a few magic touches here and there, the wilderness was made to blossom as a rose, and the *Hammersville Herald* became famous in its way. Then in the poets' corner, once in a while, appeared a wondrous bit of rhyme, full of a vagabond genius, delicious with color and tenderness, and glowing with warmth and feeling. Straightway it was copied into some powerful journal, and the nice little words neatly printed over it, "From the *Hammersville Herald*." So, thanks to Teddy, we were getting on.

Of course it is all out now. The way I got a living all these years was by editing a country newspaper; and now that the country was becoming a town, I was proprietor as well as editor, and Teddy was my comrade and assistant. We lived alone—Dolph, Teddy, and I—in an old brown house on the outskirts of Hammersville; and every thing went well with us, until Dolph, getting tired of his government office, talked of going out to Wampunsung Gap with a mining expedition. "Be it ever so humble, there's no place like hum," sang Teddy, in a rich Milesian tone.

"That's all very well in its way," said Adolphus; "but I haven't much appetite for humility in any shape. I'd like a taste of the good things of life with the rest of them."

"What are the good things of life?" asked Teddy.

"Isn't there something in 'purple and fine linen, and faring sumptuously every day?'" said Adolphus, veiling his covetousness under a quotation.

"There's something very tormenting in it, I should fancy," said Teddy. "God preserve me from the experience. I don't much care for fine linen; and I know purple would be trying to my complexion. As for faring sumptuously, I'd rather have a crust in comfort—wouldn't you, Polly?"

I grunted out something in reply, and Dolph sauntered off to his business.

A month or two later there was a great stir and bustle in Hammersville; and there appeared, in one of the columns of our paper, a Jenkinsish article stating that the rich and beautiful young widow, Mrs. Diana Debrell, would shortly take possession of her imposing mansion on the hill; and as her term of mourning had expired, there might be a few festivities expected upon this occasion.

Later there appeared many more Jenkinsish articles describing the predicted festivities, and that winter was a merry one in Hammersville. The rich, young, and lovely widow seemed also to be amiable and good-natured, and invited

every body she liked without regard to caste. Adolphus said no more about Wampunsung Gap, and the mining expedition went off without him. He took to wearing "purple and fine linen," and Teddy declared, with his usual lack of envy, that purple became Dolph so mightily that it was a thousand pities he shouldn't wear it forever. In the mean time Teddy had his hair cut off as an effort at comeliness; but stopped there, because the poor fellow saw that the experiment was a failure.

"Faith, there's something in the theory that a man is but one remove from an ape—eh, Polly?" he said, looking in the glass dolefully. Then seeing the horror and dismay I exhibited at his shorn locks, he cried out, cheerily:

"Don't mind, Polly dear. I'm a second Samson. They'll grow again directly."

"Don't bother with Delilahs, Samson," I said. Teddy blushed, poor lad, innocently enough.

"Here comes the Samson that delights this Delilah," he said, as Dolph came up the garden path.

"If that's a pun, Teddy," said I, indignantly, "it's a more wretched one than you've perpetrated this many a day."

"It's the truth!" said Teddy. "All Hammersville declares that Dolph has found favor in the eyes of the beautiful widow. What a handsome couple they are, to be sure!" he added, with a sigh.

"Well, it's better than going out to Wampunsung Gap," I said.

While we were looking out of the window, a pretty little phaeton stopped at the garden gate, and Dolph started back, lifting his hat gracefully to the fair occupant, and hastening to assist her in alighting. Then he went on down the road, and the widow walked up to the house.

"What does the fair Diana want here at this hour in the morning?" I said, turning to Teddy. The lad had suddenly darted from the window, his face in a flame.

"Tut, man," I said, snappishly, "she'll not come into the sanctum, you know. I suppose she's going to propose for Adolphus—the age is so progressive. I'll give my consent with more eagerness than dignity, I'm afraid."

A knock at the door startled us both. "Don't let her come in!" said Teddy, rumpling his hair in affright. I think I also made an effort to improve my toilet by taking off an apron that I had been using for a pen-wiper.

"She can't eat you, Teddy," said I; "and, besides, you look better in that jacket than you do in your dress-coat. With your neckcloth untied that way, and 'flowing free,' you bear a great resemblance to Lord Byron. Come in!" I added, boldly. And there entered the most enchanting figure in the world—a goddess, imperial and glorious—Venus, not as she rose from the sea, but attired in the very latest fashion—Mrs. Diana Debrell!

"Oh, Miss Merivale," she said, looking

about her curiously, "I'll go right away again! I wouldn't interfere with your literary duties for the world! But your brother said I might come in."

"Just like his impudence!" I replied. "But as long as you're here, you may as well stay."

Teddy began making an ingenious detour of the room, ambitious of getting out of the door without attracting attention to himself; and had already his hand upon the knob, when the fair widow turned and smiled sweetly upon him.

"Oh, Mr. Delaney, pray don't let me drive you away!" she said.

Teddy was rooted to the spot, burning and blushing in a pitiable state of delighted embarrassment.

"I want a favor of Miss Merivale," she pursued, in the most mellifluous of accents, "and perhaps you can help me in coaxing her to consent—all Hammersville have made up their minds that they will have it as a crowning festivity—but I'm afraid she'll think I'm very bold."

I own I was a little taken aback. Can it be possible, I thought, that she has really come to smooth the way for the wedding? Already I had the leading points of an editorial in my mind entitled, "Progress," when she turned to Teddy, and said, softly:

"We want a charade, you know—an original charade."

"A charade!" said Teddy. "Ah, yes; I know; of course—a charade!"

"And what may that be?" said I. "Perhaps, if you know so well, you'll tell me something about it; but I tell you beforehand, if it's any thing in the shape of a conundrum, you couldn't come to a worse person."

"It's a kind of parlor drama," said Teddy, "constructed out of one word. You take each syllable and make an act of it; then the whole forms a word, and the audience guesses it. It's a capital amusement—we used to play at it sometimes when I was—" Teddy stopped, blushing furiously.

"Speak out, man," said I; "when you were in Ireland, you mean. Mr. Delaney's family, madam," I said, turning to the widow, "at present only occupy the left wing of the battlements on the ramparts of the ruins in the castle Espagne. They have to climb up by a ladder now, and it's a little inconvenient; but the view is beautiful when you climb over the turret to the tower, and look over the moat. In happier days there were great festivities there—the Lord Lieutenant himself sojourned there once when he was belated at a hunt; and, if there's any obligation about it, it's thought to be on the nobleman's side. The hereditary title of the family is 'The Delaney Dun;' but my friend here scorns every thing of that kind. He's a sort of bonnet-rouge, and pays his debts honestly enough to make his ancestors' bones rattle in their coffins."

The widow looked at me open-eyed, not understanding a word that I said; but, somehow,

when she left us, I discerned a little reverence in the bow she gave to Teddy.

I turned to him, laughingly, when she went away, but there was a great look of reproach in his face, and his eyes flamed with indignation.

"I didn't think you'd be capable of it, Polyphemia," he said. And when he called me by my whole name I knew he was in earnest. "I'd rather you'd have struck me with the ruler than made fun of me that way before her!"

"Tut, you goose," said I; "it was she I was making sport of."

"And how could you?" he said, with solemn amazement. "Isn't she beautiful? Was there ever so glorious a creature? Did you notice her eyes, Polly? So deep, and dark, and luminous! And the sweet, short upper lip, and the graceful poise of her head! And her hand—oh, Polly, did you look at her hand? If you could make sport of a creature like that, there's nothing too sacred for you!"

"She's very handsome, Teddy," said I; and, to mollify his wrath, I consented to assist in writing the charade.

The day after the *Hammersville Herald* came out Teddy and I shut ourselves up in the sanctum; and, although I say it who ought not say it, we made an excellent day's work of it. The charade was certainly a success.

"The fact is, Teddy," said I, "we'll have to take to writing for the stage; there's absolute genius in this little thing."

"Well, if there isn't genius in it, it's *ingenious*," said Teddy. After that I kept the ruler in my hand, and he made no more puns that day.

The difficulty was to make Adolphus study his part. Of course he had to be the hero. I suggested to Mrs. Debrell that if she wanted the thing to go off handsomely, she'd better consent to throw over Adolphus, and give Teddy the character.

"If you want the elder Kean back again," said I to her, "there you have him in Terence Delaney. I tell you, Diana" (we'd grown pretty intimate by this time), "if you'll have Teddy for the hero we'll astonish Hammersville!"

"But Mr. Delaney's so ugly," she said, poutingly, "the beautiful costume will be quite thrown away on him; he's nice, I know, but he's so ugly," she repeated, idiomatically.

"Oh," said I, "you think so, do you? Well, let Adolphus have it, then."

"He's so handsome and talented," said Diana, blushing brightly; "he can't help but do every thing charmingly!"

"It's a free country," said I, "and every body has a right to an opinion; but I think, madam, your swan is a goose."

He was worse than a goose, he was a donkey, and a conceited donkey at that.

Let me quote just one little scene in the charade, to show the rock upon which we were wrecked.

Scene—Lady Angelica's drawing-room. *Time*

—twilight. Lady Angelica seated at her writing-desk, her head resting upon her hand, an expression of deep sadness upon her face. Enter Ignatius, disguised as a peddler—rough coat, green goggles, etc. He contemplates the scene before him, and thus apostrophizes the idol of his heart: "Do I see thee again, oh, my beloved? What madness is this that seizes upon my brain? What agony is this that assails my heart? Can I not resign thee, then, sweet empress of my heart? Ah, let me enter paradise, let me bask in the warmth of thy presence for one little moment more, and I shall be gone forever!" A smothered sob falls upon the ear of Lady Angelica; she starts, and, turning suddenly, discovers in the peddler at her feet her long-lost lover Ignatius.

Surely it was a touching and pathetic episode in the play. The subdued light, the enchanting figure of Mrs. Debrell seated at her writing-table, her beautiful face half turned from the admiring audience, the folds of her deliciously fitting, marvelously trimmed robe lying yards behind her. It fills me with indignation now, to think that Dolph couldn't bear to wear the peddler's disguise.

"You wretched peacock!" I cried, indignantly; "aren't you contented with turning into a seraph afterward, and blazing down upon the audience in top-boots and a slashed doublet?"

"But the whole thing is such wretched twaddle," he replied, with brutal frankness. "Come now, confess, Teddy; have the manliness to say what you think."

"I think it's beautiful," said dear old Teddy; "of course it's a little boshy in parts, but that only serves to show off the tragical points with effect."

The tragical points Teddy rehearsed charmingly. Coming in with a lantern in his hand, and discovering Ignatius at the feet of Lady Hidalgo, he is torn with remorse when he finds it is his preserver and benefactor.

But what mattered it how well Teddy did his part, or that Diana rivaled Mrs. Siddons, when neither threats nor entreaties could prevail upon Adolphus to go through one rehearsal with ordinary credit—when day after day passed by, and the eventful night was at hand, and he persisted in lounging in and out of the scenes without life or interest, slurring over the touching and pathetic parts, and turning the tragic points of the play into buffoonery? It was too late to draw back. It was well known that an original charade, by Miss Polyphemia Merivale, was to be performed at the mansion of Mrs. Diana Debrell. All Hammersville was on tip-toe with enthusiastic expectancy. The die was cast, my reputation was at stake, and yet Adolphus persisted in saying that it was time enough to make an ass of himself when the time came!

At last the night came, and I found myself in the luxurious home of the beautiful widow, breathing an atmosphere tempered by hot steam, and made fragrant with spoils from the hot-

house, treading ruthlessly on master-pieces of art in the shape of carpets, gazing upon wonderful paintings and statues, and reclining upon divans that would have delighted the heart of a Turk. But, truth to say, all this magnificence was thrown away upon me. I was like a fish out of water—my black silk dress cut me in the arm-holes, a collar rasped my neck painfully, and some necessity in the shape of hair gave me a fearful pang when I moved my head. I'd rather—oh how infinitely rather!—have been at home in the dear old battered, manuscript-littered, ink-stained sanctum. When the house began to fill, and taking shelter upon the stage, I peeped out from a corner of the curtain upon the sea of faces in the great drawing-room, and actually heard the musicians commence the little operatic morceau that was to precede the charade, I confess that an ignominious cowardice prompted me to make my way out of the back-door, and fly homeward as fast as my trembling legs could carry me. "It might look a little eccentric," I said to myself; "but can't a literary woman be a little odd if she likes?" I was upon the point of gathering up my skirts for a retreat, when Teddy came up to me with the manuscript. He was happy enough, dear lad, his face glowing, and his eyes shining joyfully. It was plain to be seen he wasn't out of his element if I was, and for that night at least he was quite worthy of the long line of pedigree belonging to Castle Espagne.

"You'll act as prompter, won't you, Polly?" he whispered, giving me the paper.

"What's the use, Teddy?" I groaned. "Those that know their parts know them, and those that don't, don't! You can take a horse to the water, but you can't make him drink!"

"Ah, Polly, let's do the best we can," said the dear boy, and I took the paper without a word. Then the bell tinkled, the music ceased, and up went the curtain. This act went off capitally. It was confined to Lady Angelica and her waiting-maid, and the beauty and costumes alone of the amateurs would have enchanted the audience.

A night scene, in the second act, followed, where Teddy, in a Spanish cloak, sombrero hat, and lantern, made a decided hit. At last the eventful moment approached, and after an instant of agonizing suspense, I saw Dolph lounge into the gentleman's dressing-room, with the green goggles in his hand, and the rough coat of the peddler thrown over his arm. The bell tinkled and the scene opened, disclosing the fair Lady Angelica seated at her writing-desk, her brow upon her hand. Never had Diana looked so enchantingly lovely. A murmur of admiration arose from the audience; an appreciative silence reigned in the room. "Ah," thought I, "if only Dolph can go through his part decently, all will be well." My heart beat high with hope when he passed me and went upon the stage. The rough coat completely enveloped him, a pair of great boots went halfway up his legs, and a red handkerchief and

green goggles effectually concealed his handsome face. So far, all was good.

"Do I see thee again?" he said, very slowly, and without a particle of feeling; but I didn't so much mind that. "Do I see thee again?" he repeated, musingly; then he paused, standing in a graceful enough attitude; but I was painfully cognizant he was trying to remember his part.

"Do I see thee again?" he shouted, in a sort of prolonged roar that I hoped he meant for emotion; but he paused again. Ah, what a fratricidal heart I had at that moment!

"What is the cause of this agony?" he at last stammered out, and then must needs repeat it again—"What is the cause of this agony?" he said, in quite an argumentative tone, that caused a wag in the corner to shake his head and whisper, "he didn't know."

"Why," said the wretched Dolph, "do I feel in this—this devil of a state?" he added, and of course the audience burst into a roar. He walked over to the wing where I was standing.

"Give me a cue," he said. "Can't you see I've forgot it?"

Such a rage welled up in my heart at that moment that I was choked. "One little moment more," I whispered, frantically leaping to the last words of his part.

"A little more!" he roared out, and the audience listened with some degree of respect. "A little more!" he repeated, in a hopelessly stupid tone, and floundered again.

"A little more of kin and less than kind," said Teddy, in my ear. Diana was pale as death at her writing-desk, and I flaming as a coal at the wing.

"Come off!" said Teddy, signaling to Dolph to fly from the stage. Diana's head sank for a moment, then lifted itself proudly again. I think at that moment she trusted to Teddy.

"Give me the toggery!" said Teddy, pulling the boots from Dolph's legs and wrapping himself in the peddler's cloak.

"We'll change parts," he whispered, hurriedly, "and do you, Polly, post Dolph up in mine. All he has to do is to come in with the cloak and lantern, and shout, 'Ah, villain!' But in Heaven's name be careful of the lantern, for it's filled with kerosene!" Then Teddy leaped upon the stage.

"Do I see thee again, oh, my beloved?" cried the sonorous voice of dear old Teddy, and a roseate flush overspread the face of Diana. I took heart of grace and threw aside my manuscript to listen. "What sweet madness is this that seizes upon my brain?" he cried, in the richest of monotones. "Can I not resign thee, then, sweet empress of my soul? Ah, let me enter paradise, let me bask in the warmth of thy presence for one little moment more, and I shall be gone forever!" He threw himself at her feet—his voice broke into a sob—the disguise was thrown aside—it was her lover, Ignatius!

Truly Teddy was an alluring fellow just then; there was that in his face that was better than beauty—there was genius, and feeling, and heart—there was goodness!

Diana took up her part with earnestness and grace—her voice was melody itself; her great dark eyes shone luminously; not a word did she forget. As she held out to him her charming hand, Teddy gazed upon her with rapture. The agony of his abnegation, of his immolation of self, was quite lifelike and real; he burst into a rhapsody of eloquence that startled and delighted the audience. They applauded rapturously. Diana's voice trembled in the reply; nothing could exceed the sweetness and majesty of her expression.

"Oh, Dolph," I whispered, in an agony of hope and trepidation, "surely you can say the two words, 'Ah, villain!' But take care of the lantern, I beg of you!"

"You have saved me from an act of madness," said Lady Angelica. "Oh, how I love your brave generosity!"

"It's your turn, Dolph," I whispered, and he went on the stage.

"Ah, villain!" shouted Adolphus, and, horror of horrors, he actually brandished the lantern over his head. Out tumbled the lamp, and falling upon the floor, a tongue of flame seized upon the drapery at his feet, and rapidly licked up fold after fold of the beautiful robe of Diana. Shrieks of affright burst from the audience! All was confusion and dismay. Dolph and I sprang forward to save Diana, but Teddy was first. She fell into his arms, pale and unconscious, but quite unhurt, thanks to the friendly coat of the peddler that lay within reach of Teddy's frantic grasp. The flames were soon extinguished, and a crowd of sympathizing friends rushed upon the stage.

"Give her to me, Teddy," I said, "and get home as fast as you can. Your hair is burned off this side of your head, and your face is all black and singed. Tell me, boy—tell me truly, are you hurt—are you badly burned? Come home and get some salve on your poor hands!" For in truth the boy's flesh was of more consequence to me than that of the most beautiful woman in the world.

"Never mind the salve, Polly," said Teddy, "I'm thinking of *salv*-ation just now." And in the face of this most atrocious pun he put Diana into my arms and went home. Then I put her into the arms of her housekeeper, and went after him, followed by Dolph, who insisted that it was all the fault of the lantern.

"To fill a lantern with kerosene!" he said, indignantly. "Who ever heard of such a thing?"

We found Teddy walking about the floor, his face swollen and red, his hands blistered and raw, his right eye completely closed, and not a vestige of eyebrow or eyelash about him. This pitiable sight touched Dolph to the heart. He would much rather have been killed outright than disfigured thus seriously, and he judged Teddy by himself.

"You'll never forgive me," said Dolph. "I'd kill any body that was the cause of such a calamity to me."

"You've done me a great service, unconsciously," said Teddy. Then seeing a look of stolid amazement upon Dolph's face, he added: "I was such an insignificant fellow before, you know, if it leaves a decent scar, people may turn to look at me once in a while."

"I don't see what we wanted of the lantern, at all," said I; "when the horse is gone there's no use shutting the stable-door; but what was the use of the lantern?"

"Didn't Polly put it in the play?" said Dolph.

"It was an *interpol*-ation of Providence," said Teddy, with a villainous accent upon the "pol."

The next morning nothing would do but he must come down into the sanctum.

"What will you do there, you singed monkey?" I said. "You can't write, and you can hardly see."

"But I can dictate," said Teddy; "and I won't have the editorials spoiled; and oh, Polly, let me come down and sit by you! You're the only one that's fond of me in the world!"

I helped him down, and we grew quite merry together, in spite of his pain, for I didn't see much use in spoiling his bravery by crying over him; but in my heart of hearts I honored and loved him the more that he bore his pangs like an Indian.

My head was bent over the paper, and I was slinging the ink furiously around me, when suddenly a little tap at the door startled us.

"It can't be the printer's boy; and Dolph never knocks," said Teddy, in an agonized whisper. "Oh, Polly, I think I'll run!"

"You'll have to make a charge over somebody's body, then," I replied, "for there's only the one door. Come in!" I added; and I confess I gulped down a strong exclamation, when, upon the threshold, we saw Diana, as bright and beautiful as ever; more bright and beautiful, for, upon seeing the battered and bandaged Teddy, her face became enchanting with emotion, a glow leaped into her cheek. Once, twice, she opened her lips as if to speak, but her voice faltered.

"His—his—eyes," at last she stammered out. "Oh! they're not hurt, are they?" Then, without waiting for an answer, she went over to the poor lad, and put both her hands tenderly upon his. "You've saved my life, Mr. Delaney," she said; "but I'd rather have lost it than that you should lose your eyes!" Her own filled with tears. I spilled a great dab of ink on my article.

"Tell her you can see, Teddy," said I.

"Just as well as ever," said Teddy; "and I'm very thankful to God for it, just now, at least. As to saving your life, Mrs. Debrell, it was only a lucky chance threw the boon to me. I happened to be nearest you, and the cloak was within my reach."

Teddy was pale as death, but he spoke bravely, and with his old merry accent.

"I'm glad it was you!" said Diana, still holding his hands. "I'd rather owe my life to you than any one in the world!"

Dolph entered just then, and Diana went up to him and commenced bantering him about his awkwardness with the lantern.

"All my carpet ruined, and my pretty dress; the statue of Cupid and Psyche broken to atoms; and such an awful odor of kerosene!"

Presently Dolph and she went away, and walked down the garden path together.

"Polly, Polly," said Teddy, "if there's any whisky or brandy in the house, give me a bit, for I think I'm going to faint."

"And no wonder," said I, reaching down a glass from the mantle. "Why hadn't the woman more sense than take hold of a man's hand, when the touch was agony to him?"

"Ah!" said Teddy, "why was the touch denied me? But through these triple bands of linen I felt it; I swear to you, Polly, I feel it still. Polly, Polly, miserable wretch that I am, how is it that I dare love—"

Dolph put in his head at the door.

"I'm going home with Diana, Polly," he said. "She's asked me, and I can't very well refuse; and say, I think, on the way, I'll propose. It's all a fellow can do, you know; and I may as well have it over with. Don't wait lunch for me." And Dolph went down to the phaeton that was waiting for him at the gate.

"You were saying, Teddy," said I, holding a glass of punch to his lips, "that you loved somebody—"

"It was you, Polly—I love you!"

"Don't be unhappy, then," said I, "for your passion is reciprocated. There's no necessity for any thing feeding on your damask cheek on my account."

"It's a damaged cheek, just now, Polly; and it never was a damask one. But there's Dolph; he's all roses and lilies!"

"And daffydowndillies," said I; "and he's gone to take tea in the arbor."

"Who says that all men are created free and equal?" said Teddy, fiercely. "We're trampled from our birth. Why is one man made like an Apollo, and another like an ape?"

"Why is one man given brains, and another none?"

"So that the one with brains may suffer the most," said Teddy.

These bitter words sounded very strangely from his lips, so we kept silence for a while.

As Teddy and I were alone, I determined to have something nice and warm brought to us in the sanctum; but just as the table was laid for two, and we were waiting for a delicious little game-pie to be heated, who should stalk in but Dolph? I saw from the look of his face that he had been rejected. If ever mortified vanity was depicted any where, it was there.

"She's thrown me over," he said, with his

usual frankness, scowling down upon Teddy and me.

There was a struggle in Teddy's face between relief and sympathy; but he said nothing.

"She's a cursed coquette," pursued Adolphus; "but she can't play fast and loose with me; she'll never get another chance, never!"

"It's a pity to be too hard upon her," said I. "Don't be cruel, Dolph!"

But he never noticed the sarcasm at all. "She'll find out I'm not the man to be trifled with!" he said, as we sat down to the table.

"I'll tell you what," said Dolph, helping himself to half the pie; "I'm sick of this sort of thing; I'm going out to Wampunsung Gap!"

"For a man that's crossed in love," said I, "you have an excellent appetite. Fair play with the pie, Dolph; share and share alike, you know. It was quite an unexpected pleasure having you to lunch, and we weren't quite prepared for it."

Seven days after Dolph came home with a complete trapper's outfit. He said he didn't intend to confine himself to mining; there was nothing like having two strings to one's bow. When he told me he'd given up the government office, I began to believe that he might possibly go to Wampunsung Gap; and the womanly part of my nature stirred a little, as it will at parting with one you are in the habit of fraternizing with. I found out I was a little fond of Dolph, and petted the great handsome fellow to his heart's content. Teddy had got over his injuries, and had given up hoping for the distinction of a scar; his eyebrows and eyelashes were beginning to grow, and his hands were well as ever; but he seemed unable to settle himself to write. There was no bantering at the table, and Dolph ate all the dainties himself, for Teddy had no appetite, and I was out of sorts. The fair widow had flitted away somewhere, and the great house was closed, and somehow a cloud hung over every thing.

One day the cloud resolved itself into a thunder-bolt of this kind. Dolph had gone out hunting for a rubber cover for his new rifle, and Teddy and I were alone in the sanctum. I was writing away, pretending never to notice Teddy, but once in a while stealing a look at his gruesome face as he shadowed it with his hand.

"Polly," said Teddy, suddenly, "I wish you'd let me go with Dolph!"

I dropped my pen and looked at him. "To Wampunsung Gap?" I gasped.

"Yes, Polly dear, it's the only thing that'll save me! I'm getting unfit for any thing—I want to go, Polly; oh, my good friend, my comrade, my more than sister, be generous to me!"

The boy's arms were about me, his face close to mine. I drew down his head and whispered in his ear, "Stay! Take hope! Who knows?" But he drew back, flushing painfully. "No, Polly, it is impossible! Hope would be insanity!"

From that hour it was settled. In ten days they were gone, Dolph and Teddy—gone to Wampunsung Gap!

Fancy it, ye who can, the old brown house without them! Fancy the miserable, lonely woman, gaunt and grizzled, forlorn and desolate, as destitute of joy as the stuffed owl over the sanctum door! To eat, and drink, and sleep, to dip one's pen in gall and write—ah, it was sad!

A month later a great joy leaped up in my heart only to vanish, and leave it more desolate than ever. There was a tremendous bustle at the door—the little servant burst into acclamations of delight. She bounded into the sanctum unrebuked. "Oh, ma'am," she said, her face in a flame, "here's Mr. Adolphus home again!"

My legs refused to hold me. I sat down, but looked eagerly at the door. Dolph came in and embraced me warmly. I still looked at the door. "Teddy?" I said, interrogatively, and half rising to my feet.

"Well, you see, Polly," said Dolph, "Teddy would go on."

"To Wampunsung Gap?" I said, sinking back in my chair.

"Yes," said Dolph. "The fact is, it's madness! The Indians are as thick out there as blackberries in August. Twenty-seven men were scalped and left in one place on the plains. I had an offer to go into the lumber business, and I took it up. I offered Teddy a half interest, but he would go on. Here's a letter he sent you."

I read the letter without even wiping my spectacles. After all what mattered it? I knew I never should see him again.

"DEAR POLLY,—To confess the truth I'm longing to go back. I never saw any thing so dreary in my life as this long waste of prairie, and the grass is so high now that you can fancy it quivering with redskins; but I feel somehow as if it would be cowardly to retreat, and we've heard so much from Wampunsung Gap I'd like to see it. When I get there I'll write you a glowing letter for the *Herald*, and in the mean time I'll send you some scraps jotted down by the way-side. This, for your ear, dearest of Pollys, I've got over the old weak puling despair altogether—I'm a man again, ready to do all that a man can do. Away down in my heart is the old passion: love is hard to kill, dear; but I'm none the worse for it. As for my scalp, I shall tell my red brethren I'm not an ordinary hairy person; I'm *liter-hairy*; perhaps it'll save the wretched mop that seems destined to come to grief.

"Always, my incomparable Polly,

"Your devoted

TEDDY."

That was the last scrap of his dear old hieroglyphics that came to me. Days and weeks fled by, Dolph went off to his lumbering, and married the rich lumber proprietor's daughter. The fair widow came back to her mansion on the hill. I was alone again in the old brown house—alone with the serving-maid, now rapidly strengthening into a sturdy woman. I watched and waited for the postman's ring, and scanned the letters at first with a trembling hand and a choking in the throat; but after a while quite hopelessly and mechanically.

There were none from Wampunsung Gap, not even the glowing descriptive one. I gave him plenty of time, even allowing for accidents. I was lavish in hope and patience; but all was useless, the boy was dead!

It made me mad when Dolph insisted that he might be alive. "Alive," I said, "and not write to me!"

"Well, but, hang it, Polly, when a fellow is journeying about that way, meeting with all sorts of adventure, he don't get a chance."

"Teddy isn't a fellow, he's a gentleman, Dolph," I said; "and if he was alive, he'd write to me as a gentleman ought. You see, Diana," I said (turning to the widow, who was kind enough to spend some of her time with me), "the Delaneys of Castle Espagne are of the old chivalrous, knightly order, that would scorn to keep a poor old woman like me in an agony of suspense. Teddy's without fear and without reproach, wherever he may be, that you may be sure of."

One night we sat in the sanctum alone, Diana and I, and suddenly we heard a long, loud wail outside; it was a melancholy shriek enough, and Diana fell back almost fainting.

"What's the matter, child?" said I, hastening over to her; for she had got to be dear to me for her own sake as well as for that of somebody else.

"Oh, perhaps it's the Banshee!" she said, lifting her great eyes to mine swimming with tears. "I've heard that, when any one belonging to one of those old Irish families dies, the Banshee is sure to come to their home and lament over them."

"I think it's Pluto, the tom-cat," said I; and then I was ashamed to keep up the story of Teddy's ancestry any longer, and, however it was, I told her every thing I knew of him—that he was the soul of honor, and the brightest, cheeriest, bravest, best lad that ever walked, and that his great love for her had cost him his life. I brought out his letter and showed it to her, and I gave her a beautiful little poem he wrote to her eyes, and put into her hand a sketch of her profile that he drew from the sanctum window.

"But why didn't he stay at home and tell me, if he cared for me so much?" she said, innocently enough, and then she blushed very brightly. "When I saw the flames ready to devour me that night I stretched out my arms to him, and, as he wrapped the peddler's cloak about me, he whispered, 'Don't be afraid, darling;' and I wasn't afraid. I knew he'd save me; but the next morning you saw how cold he was. I couldn't say more than I did, Polly; but it didn't matter; and now he's been murdered by those dreadful Indians. Oh, Polly, why don't they kill them all?"

"I'm coaxing the government to, all I can, Diana; but since Teddy's gone the Hammersville *Herald* hasn't much influence."

And all this time I never shed a tear for the lad! It seemed as if all within me was a great

arid desert, and not a life-spring to be found. The wound gaped wide, refusing to be healed. Day after day I sat in the sanctum, my only companions Pluto, the big black cat, and the stuffed owl over the door; and if Diana had not taken compassion on me, and once in a while come over, I'd have turned to stone.

One blustering March day I expected her to tea, and as the light began to wane, I stood by the window wondering if she'd dare venture out in a snow-storm, for the flakes began to gather and whirl madly about. I hoped she would, for all that day I had been unspeakably lonely and sad. I turned away from the window and sat down by the table again; but I couldn't read, I couldn't write, I couldn't think. In truth, I was tired and wretchedly out of sorts. Hearing a step in the hall, I was glad to think it was Dolph, and called out to him to come in. But a stranger entered; a brown, burly man, with green spectacles, and a wonderful amount of hirsute appendages; his hair hung down about his shoulders, and a tangled beard nearly reached to his waist. I thought he was a Mussulman, and bowing gravely, motioned him to a seat. I was about calling for strong coffee, and sending Hannah next door to borrow some pipes, when he took from the pocket of his coat a package.

"Madam," said he, in an accent that was not quite American, and yet not Oriental, "I am from Wampunsung Gap!"

I fell back motionless, stretching out my hand for the package.

"It's my painful duty, madam," said the man, in a sepulchral tone, "to break to you a melancholy piece of news, and to deliver into your hands this package."

"Give me the package," I said, "and never mind the news."

"It's the first time I ever heard of a person in your pursuit that didn't care for news," he said. "I hope the paper hasn't gone to the dogs?"

"But I know the news," I said. "I've felt all day as if something was going to happen to me—the worst of the blow is over. God has prepared me for it, Sir; but don't say it, for I can't bear it. I know my boy is dead, and these are his last words to me; but don't say it, Sir; I'm getting old, and I've suffered greatly. Give me the package, Sir, in Heaven's name!"

A sudden pallor overspread the face of the stranger. He half arose from his chair.

"Be—be calm, madam," he said, his voice breaking a little out of the gruffness. "I want to be certain you're the person I'm to give it to. Are you Polyphemia Merivale?"

"Yes, yes," I replied, impatiently.

He took off his gloves, and I saw that his hands were brown and weather-beaten, but singularly small, and ah, how familiarly nervous they looked!

"Editor-in-chief of the Hammersville *Herald*?" he said.

I nodded eagerly, for I couldn't speak.

"I—I—be calm, madam, I beg of you. I—I will give you the package, but I beseech of you to be calm."

I looked at him fixedly. It seemed to me that I should awake pretty soon, and find it all a dream. My heart thumped up and down in my breast. I saw through the spectacles a pair of great loving gray eyes, filled with honest tears. If it had been a dream, it would have been merciful to have let me die there and then.

"Be—be—calm," he repeated, getting upon his feet, his voice breaking into a sob; "be—be—*hang it, Polly*, can't you be calm?" Then he threw away his spectacles and caught me to his heart.

Oh, ye who have suffered, who, after long grief and pain, find the arms of your true love round you once again—only ye can tell the unspeakable joy of that moment! I was long past forty; what then? Is there no powerful love but the one?

"You spoiled it all," said Teddy; "you wouldn't be calm, do what I might. I was going to make you show me the mole on your left arm; but, in truth, Polly, my heart was full to bursting. Oh, Polyphemia Merivale! my dear old Polly, thank God you are alive and well! And how is Dolph? Married? Don't be afraid to tell me, dear. It's all gone; the old passion is burned out—not even a cinder left. I've been a captive among the Indians, Polly; and what with fire-water and the treachery of the whites, they've got sadly demoralized, and they're not a nice set of people to live with. They're a little drunken, and dirty, and given to lying and stealing, and a few other sins. I've been a medicine-man, Polly, and I've killed a few of them with the aid of Providence. But I've written it all out for the *Herald*. It's a beautiful thing. It'll bring tears to your eyes. Sensational, you know, with an impossible Indian princess in it, just to show, you know, what they might be, if they were the old imaginary heroic race. I've scraped up a goodish bit of money, Polly, and we'll spend every penny of it on the *Herald*, and live in the old sanctum, like gods together, Polly, heedless of mankind."

"Then you don't care for Diana, Teddy?"

"Not a straw, dear, except as one human creature cares for another. We all love one another, I hope, Polly."

"I'm sorry for her, poor thing!" said I.

"Why, why, what's the matter?" said Teddy. "Don't keep me in suspense, Polly. Out with it at once. She—she—she's alive, Polly?"

"Oh yes, alive and well, and beautiful as ever, and wonderfully sweet and kind. It's a pity for her; it is, indeed."

"Has she married unhappily, Polly?"

"No, she isn't married at all; but she might have been, if I'd known your character better."

"Now, Polly, what upon earth do you mean? Haven't I been tortured enough? I've had my

scalp hanging by only one hair many a time. There's tattooing all over me from the crown of my head to the sole of my foot. A fire was built on my stomach once, and would have been lighted if some horse-stealing Camanches hadn't spoiled the sport of my captors. Don't torture me any more, Polly. Tell me at once. What's the matter with Diana?"

"Why, the fact is, Teddy, I thought you loved her, you know, and I've been fool enough to teach her to love you. She's coming here to tea to-night, and you'd better keep out of her way. There's no use breaking her heart."

"You've taught her to love me, and she's coming here to tea?" repeated Teddy, growing red and pale by turns.

"Yes; if you'd staid at home you might have married her long ago."

"I! Diana! Polly, you're the soul of honor. You—you wouldn't deceive me. Oh, best and dearest of Pollys, I'm the happiest man alive!"

Then he suddenly got upon his feet, and raising his hands devoutly to Heaven, he lifted up his voice, and gave vent to one of the wildest yells it was ever my fate to listen to. It raised the hair on my head, and froze the blood in my body; it echoed and re-echoed about every rafter in the old house; it set the glasses to jingling in the cupboard in the kitchen; and the maid came running up to see what was the

matter. I was paralyzed, and stood looking at him in horror, but he turned gently to the servant.

"Don't be frightened, Hannah," he said. "I've been showing Miss Merivale the triumphant whoop of the Sioux. When they've gained a great victory, and the scalps of their enemies hang in scores about them, and they're overwhelmed with joy, that is the way they give vent to their feelings. When fifteen hundred braves or so join in a cry like that it's a grand thing to hear, when the tympanum of the ear isn't too delicate."

"I should think so," I said, gaspingly; "it's a little too much for civilization. Since you've been away we've got a corps of police in Hammersville. There's a ring at the bell. Maybe you'll please repeat it for their benefit."

"I should be happy to please the p'lice," he said, with his old villainous play upon words.

But it wasn't the police; it was Diana; and I needn't go on, I suppose. My story is too long already; I'm getting old and garrulous, I think. I've lost the happy faculty of putting things in as few words as possible; but I'll cut out this paragraph about Wampunsung Gap, and send it up to Teddy and Diana. They'll be glad to see the name in print. As for me, I live in the old brown house still; but I'm very happy, and I'm very seldom alone any more.

WINE IN AMERICA AND AMERICAN WINE.

OURS is truly a land of plenty. Whatever may be said of American cookery, all must admit that the variety and abundance of things good to cook which grow and multiply in the shadow of the spreading eagle is fully equal to the worthiness of the people; and, as compared with what any portion of Europe north of the shores and peninsulas of the Mediterranean can boast of, the superiority in quality too is with us. Humid climates, where rain falls a hundred and fifty or a hundred and seventy-five days in the year, may impart bulk and succulence to vegetables and fruit, and tenderness and juice to meats, but savor and aroma distill best from fair skies and generous sunshine, such as bless America.

Considering the profusion and excellence of the feast which Nature, at Heaven's command, has spread before this should-be happy people—considering green corn and Lima beans, tomatoes and sweet-potatoes, summer squash and marrowfats, egg-plant and okra—considering, also, buckwheat-cakes and johnny, Indian-pudding and hasty, corn-dodgers, fritters, muffins, waffles, and hoe-cakes, with hominy, big and little—considering water-melons and cantelopes, apples, peaches, and strawberries—considering, moreover, long clams and round, oysters, lobsters, and scollops, shad, white-fish, and sea-bass—considering, besides, canvas-backs, prairie-hens, and pigeons, quail, partridge, and deer, and turkey, wild and tame—considering, to con-

tinue, beans-and-pork and pumpkin-pies, maple-molasses, rosy butter, and cranberry-sauce—considering, in fine, Connecticut geese, Kentucky beef, and White Mountain mutton—it is not wonderful we should have set apart in every year one day for holding a high-mass of thanksgiving; the only wonder is, that we do not hold two of them. But maybe the institution of a second festival of gratitude is being reserved for the time when Divine Bounty shall vouchsafe to us, in addition to all this wealth of solid comfort, a liquid worthy to moisten it. We have nothing to drink.

Nothing to drink—but water! Is this as it should be? Is it consistent with Nature, is it worthy of Providence, is it in accordance with the true order and fitness of things that, while earth, air, and flood, multiplying themselves by the many differences of soil, and again by the many differences of climate, and all of them by the successive stages in the march of the seasons, combine to produce an ever-renewing variety of food to delight the palate in all its changes and fancies, our only liquid aliment should be the one tasteless, colorless, odorless, inert, cold, sad element condensed from gloomy clouds and showered down from weeping skies? Is this a drink fit for man—a spiritual being, with nerves finely strung to know all the delights of sense, for whose eye colors are, for whose ear melodies and harmonies are, and for whose breathing odors—man, created with manifold

capability, and requiring manifold incentive to put him to his proper activity? For the beasts of the field, that eat grass, yes; but for man, no!

Not water, but WINE, is the natural and providential drink for civilized and refined humanity. Wine is positive; water is negative. The one is compound, the other simple. The one corresponds to spiritual truth in the arcana of the New Jerusalem; the other, in the same arcana, to natural truth. Water quenches thirst as it puts out fire; wine, while satisfying a need, brings pleasure to the senses also, with exaltation of power to every mental and physical faculty. Water is not food, but less than food; wine is more than food. It has color, sparkle, fragrance; is fine, spiritual, ethereal, dynamic; has quality, variety, occult property, mystery, interest, value, good, and evil.

Yes, it is good or it is evil according as it is received, as all blessings are which God bestows and man receives—be it a wife, a beef-steak, or a steam-engine. Which brings to mind that many excellent and intelligent people in this country refuse to admit wine to be good at all, but, on the contrary, fixedly believe it to be wholly and outrageously evil; and that before going further into the subject of wine supply it is proper to consider in a brief way the basis of their belief. Of the good or evil effects of drinking pure wine Americans have small means of judging. The dogmas of total abstinence have been built upon facts existing in two countries where pure wine is an almost unknown thing—upon British and American facts. Not in France, not in Spain, or Portugal, or Italy, or Switzerland, or South Germany, are gathered the awful statistics of the temperance lecturer; but from Britain, from America, and other countries, where a kind of necessity, or at least a controlling fatality, has led to the using as a beverage what in grape-growing climates is hardly known save as a medicine. The advocates of abstinence, having made out their case against distilled spirits, demand judgment against wine also. Having shown that drinking whisky or rum tends in a dangerous degree to make men drunkards, they jump to the conclusion that wine-drinking must also tend in a like degree to the same calamitous result. By such reasoners it is assumed:

First, that alcohol as found in distilled spirits and alcohol as found in wine that has not been distilled exists in both cases under identically the same conditions, and has on the drinker the same effects.

Secondly, that the foreign wines which are usually consumed in America and Britain are the same as what the people of the countries which produce them drink at home, and the same as what we should drink in case we grew our own wines at home.

But distilled and undistilled alcohol exist under very different conditions, and have very different effects. And to reason from port,

sherry, and Madeira, and other liquors that come to us in ships, to the wine that will spring from our own soil, if our vine culture be blessed, is by no means admissible.

Simple alcohol is not a drink at all. It is never taken without a large admixture of water, and usually of other substances. Brandy, whisky, and rum contain nearly as much water as they do of alcohol, even before being diluted for drinking; while wine is in its nature a very delicate combination of various ingredients, with all of which we are not yet fully acquainted. Alcoholic drinks, then, being essentially compounds, either naturally or artificially formed, they can not be fairly judged without considering the properties of the various substances which compose them, the proportions they bear to each other, and the manner in which they combine. And to assert that the alcohol which condenses in the worm of the still from the vapor of boiling wine is the very same thing to the drinker of it—to his stomach, brain, and nerves—that it would have been if it had remained united with all those other constituents, with the sugar, acids, tannin, resin, salts, and ethers which were its companions in the vine sap, were elaborated with it in the leaf, and ripened with it in the grape, is to say what requires the very strongest proof to sustain it. But no such proof exists; while the contrary can be abundantly shown.

It has always been known that distilled spirits, diluted to the strength of wine, are much more intoxicating, more heating, and quicker in its action than the latter; for which reason and others it was, not very long ago, thought that alcohol, as such, did not exist in wine. Macculloch as well as Henderson, in their works on the subject, fully recognize the difference; and so does Carpenter, the highest authority against alcoholic drinks, the latter remarking that even the brandied wines drunk in England “give a more continued support, with less of stimulation,” than spirits do. Mr. Redding, in his valuable work, says, in reference to the same subject: “How this difference between combined and uncombined alcohol happens baffles the research of science to explain; but it is sufficient to know that such is the incontrovertible fact.” Macculloch, to account for it, conjectures that alcohol may be, like carburetted hydrogen, subject to variations of composition; while Carpenter supposes the difference may result from “the peculiar state of admixture” of the alcohol that is in wine. But we can now do something better than conjecture. We now know that distilled alcohol combines very much more feebly with water, and whatever else it is mixed with, than the alcohol that inheres in wine does with the water and other various substances with which it is there naturally associated. There is a difference, then, between the two in their modes of combination. This fact of itself goes far toward solving the problem, even if we forget to consider, as some of the above writers seem to have done, the modi-

fyng power of those other substances, and the proportions they bear to each other. And now to prove the fact.

M. Delarue, a French chemist, in giving instructions how to detect adulterations of wine with spirits, says: "Take some of the wine to be tested in a porcelain capsule, which place over an alcohol lamp. Float in the wine a nut-shell filled with oil, in which put a floating taper. Ballast the nut-shell with shot till its edges are brought even with the surface of the surrounding liquid. Light the lamp and the taper. Now if you place a thermometer in the bowl, you will see that at 45 degrees of centigrade alcoholic vapors will rise from the wine and catch fire, forming round the taper a reddish halo. Repeat the experiment with natural wine, and the vapors will not show themselves *until the wine has reached 90 degrees of centigrade, almost boiling-point*. In the first place the alcohol was in the condition of a simple mixture; in the second it was in a state of combination, or, we may say, *intimate incorporation*, and retained by a cohesive force not to be broken *except by a high degree of heat*."

The difference thus established between alcohol as a constituent of a natural compound and as an artificial extract from that compound is most marked, and its consequences must needs be such as, if duly considered, will release wine-drinking from all logical connection with spirit-drinking, and entitle it to a separate trial on its own merits. The temperature of the stomach is about 36 degrees of centigrade, so that distilled alcohol, which passes into vapor at 45 degrees, needs only nine degrees more of heat than it finds there to set it free from the water and whatever else it may have been mixed with, and from the modifying influence of such, while 54 degrees above the heat of the stomach are required to liberate the alcohol held in wine. In other words, the one would require *six times* as much force to set it free as the other would, whatever that force might be.

Though we have as yet no light by which to follow all the processes of nature through the labyrinths of the human system, and learn the actual consequences of the difference in question, yet certain of them will readily suggest themselves as reasonably to be inferred.

Distilled liquors, after reaching the stomach, will very soon decompose, the alcohol going one way and the water, etc., going another; these last, following the usual course of fluids, being taken up by the absorbent vessels and carried into the general circulation. Pure wine, there is every reason to believe, also follows the usual course of fluids, and without undergoing any change in its component parts. But even if a portion of its alcohol be liberated while in the stomach, and before the absorbents have time to act—of which, however, there is no proof—it must be but a small portion, owing to the cohesive power which holds it to its fellow-components. All, or nearly all, of the wine, then, will pass out of the stomach *as wine*, and as such

go through the channels of circulation; and the alcohol contained in it will circulate and act in connection with and qualified by all those various substances of high qualifying power which Nature, in her own wise way, has given to conduct it to its proper uses and restrain it from perverted ones. Of those substances and their efficacy in combination we know something, but by no means all; and what we know, as well as what we do not know, alike admonish us not to condemn wine as a whole for the sins of any one of its detached parts. Thus what insight our small chemical knowledge affords concurs with exterior indications in bringing us to the conclusion that when wine is drunk that is pure its alcohol acts, not independently, but in combination; not abruptly, but gradually; and as it circulates, economizes and slowly distributes its power through every organ and member with an even, a balanced, and a mild effect, continuing long and disturbing little; exciting moderately, but sustaining much. On the other hand, the alcohol of brandy, whisky, and rum, escaping easily soon after entering the stomach, goes free and uncontrolled to work its will upon the tissues of the drinker; for which Nature is not responsible, but man, whose art has wrested the powerful fluid from its native envelopment, and man must bear both the consequences and the responsibility.

But not only can distilled alcohol, when drunk, thus easily separate itself from its mixtures, but it can, as has been shown, pass into the form of vapor *six times* as readily as the other; and vapor is the form in which it is quickest and strongest. Liebig says: "Owing to its volatility and the ease with which its vapors permeate animal membranes and tissues, alcohol can spread throughout the body in all directions." A dog, into whose stomach Doctor Percy injected simple alcohol, fell almost instantly dead; breathing and pulsation ceasing in two minutes. Upon dissection the stomach was found nearly empty, while the blood was strongly impregnated with alcohol. The vital forces had converted it into vapor, which had immediately pervaded the whole body without regard to the channels by which fluids find their way. Now there is nothing to show that the alcohol of pure wine vaporizes at all while in the body. For aught we can learn it remains liquid until finally decomposed in the lungs and at the surface of the skin into the vapor of water and carbonic acid gas, though possibly it may vaporize to a partial extent. However this may be, the greater quickness which the one alcohol, as compared with the other, passes into the subtle and potent form of vapor of itself establishes between the two another most important difference. It was the suddenness of the conversion into vapor that killed the dog. Had the process of vaporization occupied an hour the animal would have lived. "Alcohol is alcohol," says the chemist; but the difference between a gradual decomposition and a sudden explosion is such as renders combined

and uncombined alcohol, for present purposes, two and not one.

The chief danger attending the habitual drinking of distilled spirits is, that a craving for them may result which the will is impotent to control. This craving amounts to insanity, and is in fact a veritable bodily disease, known among physicians as "oinomania." Doctor Carpenter, in his celebrated essay against alcoholic drinks, says of it, that it "is an inordinate and uncontrollable thirst for excessive quantities of intoxicating drinks." Drinkers not thus afflicted, he says, "possess self-control, and can at any time refrain from stimulants; but those affected by the disease can not do so." Again he says: "I repeat that the disease does not consist in the mere act or habit of becoming intoxicated, but in the irresistible impulse which drives the unhappy being to do what he knows to be pernicious and wrong, and which, in the intervals of his paroxysm, he views with loathing and disgust."

This disease it is which makes drunkards of men, and makes all spirit-drinking a peril. This it is whose dreadful consequences have brought opprobrium on every thing from which alcohol may be extracted, and involved in moral, religious, and even legal interdiction the very liquid which can prevent it more effectually than can morality, religion, and law combined.

To create such a disease it is easy to see how infinitely more potent must be an artificial extract, whose quickly generated steam attacks immediately and directly the linings of the stomach, shocks the nerves and brain with rude explosions, and flits unhindered through every chamber of the body, than can possibly be the milder compound of nature's make. Indeed, it is hard to conceive that wine should ever create the disease in any case; and accordingly wine-drinking is rarely opposed on any other ground than that it leads to and educates the taste for stronger and more dangerous liquids. That this should be the common opinion in America is not astonishing; for it is formed from observation of the results of drinking imported wines, and these, with rare exceptions, contain a considerable mixture of distilled alcohol. What spirits and water can do, spirits and wine can also do, and yet the wine itself remain as innocent as the water. The three British wines, as port, Madeira, and sherry may be called, are so largely adulterated that, instead of containing about nine per cent. of alcohol, like what is drunk in wine-growing countries, they contain from twenty to twenty-six per cent. French red wines, known as claret, are usually "fortified" before shipment with no trifling proportion of distilled alcohol, the laws of France allowing the addition, free of duty, of as much as five per cent. The same is true of importations from other countries than France, as well as those from California. Port, Madeira, and sherry scarcely merit the name of wines. They are concoctions, rather,

made up to please the palates and cravings, and possibly to answer the physical needs, of dwellers in the damp and chilly climate of the British Isles, from whom our own countrymen have derived a taste for the same factitious liquors, by inheritance and the force of fashion. As for the imitations of these last, which are manufactured in America and sold cheap, they are considerably worse than common whisky. French and German and other European light wines, as well as those from California, are "fortified" merely to preserve them on the voyage of shipment, and ought not to be discarded so long as nothing purer can be had. Still, in measure as they are fortified, they all contain an element of danger. Bearing these facts in mind, and also the peculiar action of distilled alcohol on the human system, we can not wonder it should be a common opinion in America that wine-drinking is only a school for brandy, whisky, and rum drinking.

But is the drinking of pure wine, as practiced in grape-growing countries, and as we may expect it to be practiced in our own, if the vine shall thrive here, attended with the same objection? Who believes it is, that knows any thing of those countries? True, it is sometimes boldly, desperately asserted that the people of France are as drunken as Americans are; and such assaults upon reason and fact are confusing and difficult to meet at first, for they bring all testimony into discredit; but, with a little reflection, they may be completely disposed of.

The wine-drinking that leads to spirit-drinking, so soon as it has developed in the victim incipient oinomania, is abandoned for the stronger drink. Port, sherry, and Madeira, when once they have created the insane craving, are found insufficient to satisfy it. It must have what is quicker, hotter, and stronger than either of them. The drunkard will take wine only when he can not obtain spirits. And the people of any country, whom the use of wine has taught to love brandy, will no longer drink the first if they can get the last. This seems evident. And this being so, then, if pure wine is no better than impure, what are we to make of the French people? The whole living generation of them have been schooled in drunkenness (if the free consumption of red wine can so school them) ever since they were weaned; and if the drunkard's thirst be hereditary, as it doubtless is, then the whole nation have been taking the same kind of instruction during some twenty centuries; yet have they not abandoned wine, nor taken to strong drink. One proof they have not taken to strong drink is that they have not given up wine; and another is that they do not manufacture any considerable quantity of strong liquors to drink, but remain content with the mild beverage of their fathers in its simplest form, instead of distilling it into the pabulum of drunkenness. The production of wine in France is growing yearly larger, the last crop having amounted to near 1800 millions of gallons, and the aver-

age yield is equal to half a bottle daily for every inhabitant; so that, allowing for what is exported and distilled, and taking into account the consumption of cider, perry, and beer, and the reduced allowance of children and very poor persons, it may be assumed that the Frenchman who earns full wages consumes a whole bottle every day. The yearly production of brandy in France, though the wine crop would yield 200 millions of gallons if distilled, is only about 16 millions of gallons. The production of other spirits and the importation from other countries about counterbalance the exports, so that the 16 millions of gallons must supply all home demands. About 4 millions are needed in fortifying wines exported abroad, and if we allow one-half of the remaining 12 millions to be consumed in the arts, in the form of simple alcohol, there remains for drinking only little more than a pint to each person. Thus Frenchmen, largely aided by foreign sojourners of every wicked class, take only a little more brandy in a whole year than they do of wine in a single day. If wine is the preparatory school for rum, our people are apter scholars than they. With only a few millions of gallons yearly of instruction, in the shape of fortified foreign wines, and under the discouragement of a strong public sentiment allying morality, piety, and law against it, we annually produce 100 millions of gallons of whisky, and drink almost every drop of it at home; and this, although not one in ten of us habitually takes wine, nor one in ten touches whisky at all. Truly, if drinking wine leads to spirit-drinking and drunkenness, it is by a long road and at a slow pace. The nine per cent. red wine of the French breakfast and dinner table is, in fact, neither a fit liquor for inducing drunkenness nor for satisfying it. It stimulates, to be sure, as do a hundred other unforbidden things; but, so far from its unduly exciting the head, there is doubt if the Frenchman, accustomed from infancy to drink it, but seldom doing so between meals, derives as much excitement from his wine as his cup of coffee affords. He is gayer than an American, to be sure, but gayety is hardly a sin.

Other testimony in favor of the temperate habits of the French people is found in their preferring red wine to white, although the latter is one-fifth stronger, and so much quicker in its action as to be perhaps one-half more intoxicating. All grapes will not make red wine, but all will make white; yet so much more do they love the milder form of drink that only under peculiar circumstances are white grapes grown or white wines made. A French gentleman traveling in this country was offered some of our American wines to drink. He remarked: "It appears as if your people made wine for the purpose of getting drunk with it. In France we make it to drink when we are thirsty, and therefore make it red whenever we can. In Germany perhaps the climate may render stimulating white wines such as are there produced necessary, or, at any rate, harmless;

but in the climate of France we do not find it so. Perhaps it is the German vine-cultivators have introduced in America the plan of making wine with the press; you would do well to engage some Frenchmen to show you how to make it in a vat." Red wine, as is well known, is made by merely crushing the fruit, and then flinging it into a vat to ferment, while white wine is made by fermenting only the juice which a strong machine presses out. In the one case all parts of the grape contribute to make up the compound, or rather the original combination remains undisturbed, and all that can enter into a fluid state is allowed to do so; in the other all the more solid parts, including seeds and skins, are rejected, and the wine thus produced is in the nature of an artificial extract or concentration, which well accounts for its more rapid and exciting effects. The nature of our climate, our natural preference for "clarets," and many other circumstances, show that for the greater portion of our people red wine should be the drink. By beginning with making white wines, whatever were the inducements to do so, we made a false start, which should be corrected. In judging new varieties their fitness for producing red wine should be a controlling consideration; and if the *V. labrusca*, fox family, which has chiefly supplied us with plants thus far, will not give what is needed, the *V. æstivalis* will abundantly suffice.

But to return to France and to temperance. Whatever may be said of the French nation by their hereditary enemies and habitual traducers, they possess some virtues that do not usually grow in the soil of intemperance. Drinking seas of wine has not prevented their being more industrious, saving, prudent, and orderly, more polite to strangers and respectful to each other, more dutiful to their parents, more devoted to their children, and more obedient to law, than either the English or Americans. As Lincoln said of the whisky that Grant drunk, if such be its results, we might do well to get some wine "of the same brand." Where shall we get it?

Not from abroad. Wines transported by sea are almost sure to be "fortified." Such as are brought in bottles do not need it, and are more like to be pure; but such are only for the rich. We might bring over claret in its pure state, in midwinter of the first year, but we do not. As a rule, imported wines will be "fortified" at the best; and therefore the interests of temperance demand we should grow our wines at home, and consume them as near to where produced as may be. But another consideration settles the question. If we become a wine-drinking people our present population will need 1000 millions of gallons yearly. This quantity, estimated at the average value of wines in France, in first hands, which is 19 cents a gallon, would cost nearly 200 millions of dollars there; but estimated by present retail prices in New York the figures swell to the skies, and put quite beyond possibility the obtaining of a supply from Europe.

"Clarets" that sell here when bottled and boxed for from \$4 to \$6 a dozen—equal to \$2 and \$3 a gallon—only cost to the merchant of Cette, when he buys of the producer in Languedoc, from 10 to 20 cents a gallon, or to the Bordeaux man, when he buys of the cultivators of the inferior parts of the Bordelais, from 20 to 40 cents; while California wines, which it was hoped would prove a means of cheap and plentiful supply, though costing no more at the places where they are grown, sell in the Atlantic cities even dearer than the French. At any such rates as these our yearly drinking would cost as much as ten cotton crops would pay! And so the question of wine-drinking in America resolves itself into the question of grape-growing in America.

Though the slow and unsatisfactory progress our grape cultivation has thus far made seems to answer this last in the negative, yet it must be considered that, owing to the rude changes of temperature in our climate, foreign vines have failed us, so that we have been forced to go into the forest, and, as it were, create our grape plants out of the raw material which savage nature affords; and it must also be considered that just at the time when our experiments seemed resulting in success there came out of the skies to blast our hopes the first and only disease ever sent upon the vine since it was planted on the slopes of Ararat; therefore patience!

The discoverers of the continent, wherever they touched the coast, or however far they explored the interior, found the grape growing. Gigantic vines clambered over cliffs of granite and ledges of limestone, bore down with their weight great trees of the primitive forest, festooned with beauty the borders of rivers and creeks, and, before European herds came to browse them away, ramped down to the very shores of the sea. A cargo of voyagers approaching the coast of North Carolina, while as yet more than a hundred miles off, were met, as they told, with a perfume of welcome so sweet and strong it enveloped and pervaded their ship as if she were sailing among gardens. It was the breath of vine-blossoms, borne on western breezes from that land of the grape. As long as the forest itself had stood it had been the home of the vine, whose generations produced and reproduced themselves within its shelter, waiting for man to come. Three families there were, known to botany as *Vitis labrusca*, *Vitis æstivilis*, and *Vitis vulpina*, otherwise named after the fox, the frost, and the bull. They were mostly hard, thick-skinned, and sour, for their energies were expended in reproduction, to the end that their species might be preserved through the many dangers that beset their wild condition. Yet from time to time they would fling off luscious varieties; seedlings of chance, though fulfilling design; fit for the use of man, yet needing the fostering of his hand, because fine and delicate, and perishing without it. And thus those wild originals of the vine will con-

tinue to do while the forest stands; for the rude changes of our climate destroy the tender plants brought from Europe, and a hardy stock is needed that is native to the soil. Seedlings of chance and foundlings of the woods are our Herbemont, Lenoir, and Norton's Virginia, members of the frost family; the Catawba, Concord, and Delaware, with many more, members of the fox family; and the Scuppernong and others, of the bull. These we know and have, and others we look and hope for. How many as good or better than they have perished in their bleak nursery for want of adoption none can guess.

But we have vines enough, and they are good enough to grow wine to satisfy the hemisphere, even though another variety should never be discovered. All needed is, that we know how to place and how to cultivate and preserve them; and richly furnished as is the board of our national feast, the drink that shall fill its now empty crystals will be worthy of it. The same conditions which produce good apples and peaches can produce good grapes. Diversity of soil and climate will give diversity of product; warm sunbeams, clear skies, and a dry atmosphere will insure sweetness and flavor in the fruit, and richness, body, and bouquet in the wine. In most of our varieties there is an excess of flavor to be tempered down by cultivation. Many of them are superabundant in sugar, while others yield a juice whose color is so deep that it too might be deemed excessive, if it were possible for wine to be too red. And if the musky flavor of the foxes is by many disliked, be it known that the important family of frost grapes, *Vitis æstivilis*, have none of it whatever, but only such delicate bouquet and savor as the most fastidious European taste may accept. With such materials we must be poor cultivators indeed if we fail soon to produce something better than what Europeans now send for our drinking, and in time something equal to what they keep for their own.

Though few or none of our grape-growers have yet planted in soils poor enough for growing fine wines, and though for various reasons the culture remains still in its infancy, there have already been some good results obtained. The ill-used and much-abused Catawba, whatever may be thought of it as a still wine, has, by virtue of its excess of tartaric acid, such an affinity, so to speak, for sugar, that if, while yet in the greenness of its first year, it is properly compounded with sugar and ice, a summer drink is made of unequaled excellence. A cobbler of new wine, grown in the valley of the Ohio, or Missouri, where the Catawba ripens almost to blackness, drunk when the dog-star rages, lingers in memory for life. The exile from his native land, whom summer heats overtake, will long for it even on the Rhine or Garonne, whose borders supply no drink to match it; nor can the sherbets of the Orient or cliquot frappé make him forget the cobbler that repaired his soul in the Western bar-room. For the same reason (its happy mode of combining with

sugar) sparkling Catawba, properly made and from choice selections of raw material, is fully equal to the average quality of the Champagne we import. The Scuppernong, too, put up in sparkling form, though in respect to acidity quite opposite to the other, can make as good a drink, to say the least, as Moselle. Delaware and Herbemont, the one for the South and the other for the North, have already proved themselves capable of great things, though every one may not yet know it. Finally, the Norton's Virginia seedling, even when grown on strong corn land, gives an abundant yield of wine that is pure to the taste, vinous, full-bodied, red as blood, yet clear as rock water, which none would require to be taught how to love. Let this only be produced in sufficient quantity, and it will be at once accepted as a substitute for all ordinary sorts of claret; while for such as shall be grown on fine soils an altogether higher destiny awaits: all which is written by one who is fully aware that American wines have been immeasurably overpraised.

But there are few persons outside of the Catawba districts that have ever tasted a genuine cobbler. The inequality in sparkling Catawba has discouraged its best friends. Of red Norton or sparkling Scuppernong little enough is known, and the same is true of Delaware and others, on which good judges who know them build great hopes. But why should we have only hope to drink? and when will something more liquid be poured into our glasses? It is a whole generation since vine-culture begun in the neighborhood of Cincinnati. Nearly every one of the plants just named was discovered more than twenty years ago; and yet down to the present time very little wine that is tolerable has been produced, and none that is cheap. None of it has yet made for itself a respectable market in the large cities outside of the neighborhoods where it is grown; and through the country generally American wine is but little known and poorly esteemed by habitual wine-drinkers. Very different from this was promised by the enthusiastic pioneers in grape-culture of thirty years ago. Alas, there is a lion in the path! There are two; one called "Mildew," and the other and lesser one "Black rot." Other impediments there have been, such as retard all new enterprises; but were it not for mildew, otherwise known as "oïdium" and black rot, otherwise known as "charbon," nothing had hindered the promises of 1840 being fulfilled before 1870.

Those who labored in the beginning dreamed little of the disasters in store for their beautiful enterprise; for of the two scourges just named one had not yet been let loose upon the earth, and the other they had never heard of. The vines earliest planted by Mr. Longworth and his co-laborers came rapidly into bearing, yielded abundantly, and were exceedingly profitable. The proclamations of success then made, and promises of great results, remind one who reads them now of reports often heard since then con-

cerning the Missouri, Lake Island, Lake Shore, Crooked Lake, and California grape districts. More than a thousand gallons of Catawba "must" to the acre were sometimes produced. Eight hundred gallon crops were common, and, all allowances being made for frost and other casualty, the result of the first six or eight years' experience showed that, with good cultivation, a yearly average of four hundred gallons to the acre could be counted upon. Success most brilliant seemed assured. The plain wine of the Catawba, a little too hard and sour to be loved at first tasting, was gladly received as being at least healthy, pure, and our own, and people set themselves to learn to admire it. But when it took the sparkling form, in bottles just like those of Champagne, popping, frothing, and prickling just like it, and often tasting quite as well, a truly patriotic sentiment was aroused in its favor. Orders came faster than they could be supplied. Gold medals and silver cups were showered in from exhibitions and fairs. The enthusiasm of the pioneers was met by a receptive enthusiasm full as high on the part of the people, and all got exhilarated with the wine that was promised in advance of its coming.

But a blight came upon our vines, and a mildew on our hopes. To-day the forty vineyards which Longworth planted are being cut up, root and branch. The large wine-house he built in Cincinnati is converted into an oil-refinery, and the half million of dollars he embarked in the undertaking has sunk and gives no account of itself. The great valley whose slopes he hoped to see adorned like those of many a river in the Old World—as fragrant at blossom-time, and as purple and joyous at vintage—has become, for the vine, a valley of desolation. When he died, in 1863, the doom of his hopes was sufficiently evident, though not as yet fully accomplished; but to the last he refused to despair, and it was well enough he should pass away without knowing how nearly had failed the great work of his life. Among his last words before losing consciousness was an inquiry if the writer of this had arrived: he wanted to tell him, he said, of a new vine he had found which would neither mildew nor rot. He never found it in this world.

About the time the progress of grape-growing was arrested in the district where it originated some new seedling plants were introduced which found favor with cultivators in the new vine districts that had been meanwhile developed in Missouri, in the islands and borders of Lake Erie, and the borders of Crooked Lake, in New York, and which, being new, had as yet escaped the calamity that overtook the older one. These plants were the Concord, Delaware, Diana, Ives' seedling, and Norton's Virginia seedling, and others of less note. In the new districts these remained healthy and produced well during several years, which was partly because they were new varieties, and partly because the plantations were young; for while its youthful vigor

lasts the vine will triumph over almost every disadvantage and danger. And for a good while even the Catawba flourished so well in those districts (excepting that of the Missouri) that it was largely retained in connection with the others. But the cultivators in the neighborhood of the Ohio were too discouraged to pay much attention to the new-comers until after their success in other places had established their value and sent their fame abroad. Then some of the more courageous were induced to believe in the invulnerability of the Concord and Ives, of which so much was heard, and planted a few vineyards of them among the very graves of defunct Catawbas.

The good success which, for a while, attended this new development created a fresh enthusiasm, under whose impulse grape-growing took a wide extension. Ohio statistics, the most reliable we have, show the "acreage" of vineyard in that State to have more than trebled in the five years following 1864. Crops which yielded at the press from 1000 to 1500 gallons of wine, worth within the year from \$2 to \$3 a gallon, or which when sold as fruit brought as good a return, quite turned people's heads. Land in vine neighborhoods mounted rapidly in value, as high sometimes as \$1000 an acre. Enormous prices were paid for rooted plants, when cuttings would have done better; and the plants, as soon as they came into bearing, were allowed to bear twice what they could ripen well or their permanent vigor endure. All fears of disaster were derided, and the sad fate of the cultivators of the Ohio Valley, when cited, was met with the theory that all the new vines were safe every where, and that even the Catawba was safe in the newer of the new districts—merely a pleasant theory of hope which abandoned the old to decay, but promised indestructible vigor and immortal life to the new.

But for all this the destroyer has found them out. The experience of the last two seasons, and especially of the very last, has proved that no vine, nor soil, nor situation can be accounted safe. By the Ohio statistics of 1868 it appears that, notwithstanding the large extent of new vineyard coming into bearing, the crop of that year fell off one-half. And though the report for the year 1869 is not yet made, it is well known that it was far more disastrous than the other, and that the ravages of mildew were such as, if continued, must effectually finish grape-growing in America. The destruction that visited the old vineyards was no swifter than what is now accomplishing the ruin of the new ones. Where the disease comes, it comes to stay; and it is blindness not to see that, with few exceptions, which no man can promise will continue to be so, the same calamity that happened to the Catawbas of the Ohio has happened, is happening, or will happen to all other vines in all other places—will happen unless a remedy be found.

The black rot is a carbonic deposit of intense black, which forms on the green surfaces of the

vine-stalk, its foliage, and fruit. It also appears on other kinds of fruit, and especially the apple, which has been of late years very seriously injured by it; the pippin suffering the most, it is said. On the grape, however, its ravages are the most serious. The causes which immediately act to bring on its attacks are rain, heavy dew, or fog abruptly followed by a warm sunshine, while the conditions which predispose to its attacks are want of drainage, or of ventilation, or both. It is of the nature of rust in wheat, and is likened to it by a writer who described it as afflicting the vines of Greece two thousand years ago; ever since which time it has haunted the Mediterranean shores, where it attacks grapes, apples, pears, olives, mulberries, and other fruit. They call it in France "charbon" and "black sickness." Now, nothing could be more inviting to this black evil than vines planted in the undrained stiff clay soil of the hills of the Ohio; and it is not strange that, in so warm and foggy a valley, it should make its appearance as soon as the newly-trenched soil had time to again compact itself, and the first vigor of young vines had become exhausted. But the black rot, though sufficiently troublesome, is still an endurable affliction. In the Mediterranean countries it has always existed, and though in very damp seasons it has been known to destroy a third of a crop of some varieties, it is there esteemed of small account when compared with the fell oidium, the only disease properly so called that has ever visited the grape, and which has been let loose upon the earth so inopportunistically for us.

This oidium was first observed in the year 1846, when it appeared upon the vines of a hot graperie in Margate, England, having been bred there, as some suppose, by the unnatural fattening process common in such places, as hog cholera is thought to have been developed in swill-fed distillery pens. From the Margate hot-house it went forth to afflict the free vines of open-air culture with the penalty of a sin of which they themselves were innocent, and in four or five years had spread over all Europe, playing havoc every where, but proving most fatal in the warmer districts, and filling cultivators with dismay. It soon reached the island of Madeira, where it was so destructive that the vine culture was generally abandoned, the plants uprooted, and the ground devoted to raising food for the famine-stricken inhabitants. The same would have been done in the greater portion of the European districts, had not the discovery been made that powdered sulphur sprinkled dry upon the vines, by means of a bellows or dredge-box, if often and thoroughly enough done, would effectually cure the disease, by destroying in its early stages of growth the mushroom parasite whose presence constitutes it. It had early been proved that sulphur, scattered on the heating pipes, where it soon turns to vapor, was an effectual way to keep the disease out of hot-houses; but it needed a long while to demonstrate to the sat-

isfaction of the parties most concerned the efficacy of the same drug in the open air. To obtain general faith and acceptance for the remedy among the panic-stricken cultivators of France, the combined and persistent efforts of philanthropic gentlemen, agricultural societies, and governmental administration had to be continued during several years. Those efforts were, however, successful at last, and the vine was saved.

Though it is generally believed the oïdium originated as above, yet it may possibly be true that it was an old thing on this continent before ever heard of in Europe, and co-operated with black rot to ruin our early vineyards before the date when it is said to have come across the ocean. However this may be, we know that soon after it got abroad in Europe, the oïdium, or something essentially like it, was observed on the vines of this country; and though their tougher foliage and fruit helped them to resist it stubbornly and long, they have finally succumbed, every variety of them of any established value, and in every district of all our vine region, not excepting California. And whatever may be said to the contrary, the vine culture in America is at a point when the question before all others is, Who shall be master of the vineyard—the planter of it, or the invader that is there? Until this is decided it is mere waste and folly to lay out ground for new plantations, or hybridize for new varieties; and to promise flowing wine for the thirsty no better than mockery.

The Europeans cure their disease, can we cure ours? Strange to say, we have never yet seriously tried to do so. There have been partial trials and partial success, and sometimes supposed failures. But the methods and principles which science and practice have discovered and explained for the guidance of vine-growers in Europe were never promulgated here until the writer of this lately attempted to do so,* and of course could not be properly followed. The writer himself tested the efficacy of the sulphur-cure during the pestilential season of 1869, in an old and badly diseased vineyard of Catawbas in the Ohio Valley, and with the most complete success. This has encouraged him to write a small volume,† in which will be found the necessary practical instructions for applying sulphur to the cure of American vines. Since this little work is the only one of the kind accessible to American vine-growers, he makes no scruple of calling attention to it here for the benefit of whoever may be willing to co-operate in the salvation of the vine.

Black rot is not curable with sulphur, nor any thing else, it being a mode of decay, and not a disease. In certain situations and soils, and in wet seasons, and with varieties peculiarly susceptible to it, the black rot will be a bad vis-

itor. It may be in large measure prevented, however, by the methods used in France, which are good drainage and good circulation of air; so that if we can but conquer the oïdium, or mildew, there will remain nothing to frighten us from continuing the endeavor to draw a supply of wine from our native soil.

Thus the question of wine supply having, as has been seen, resolved itself into that of grape-growing, this last in its turn resolves itself into the question of the curability of the grape disease. Between the promoters of the cause of pure wine and the accomplishment of their aims nothing now stands but a small, a contemptibly little parasite mushroom, an erysephe, a cryptogam of the family of Mucedines. Look at it! To the naked eye it appears only as a white or whitish dust; but in a microscope this dust is perceived to consist of a multitude of fungi, slender and of club-like form, which sustain themselves upon a net-work of long, rambling roots covering the surface of the stalk, leaf, stem, or fruit. The roots soon throw downward little claws, which pierce the outer skin and grapple to it, the wounds thus given resulting in all the multiform mischief which the vine suffers from the presence of the parasite. The mushroom is at most the $\frac{1}{175}$ th part of an inch in height, and the $\frac{1}{2500}$ th part of an inch in thickness. Behold our enemy!

And if we can not kill this thing, then the merry industry founded by Noah and Bacchus, the promise of the fruit clusters from the land of promise, the blossoming in June and the purpling in August, the joyous vintage, the ruddy press-floor and the bubbling vat, the miracle of Cana and parable of the vine, the poetry, imagery, and song, and all that comes to us from afar telling of wine—wine the restorer—wine the sustainer—wine the enlivener—are made foreign and remote to the generations of this continent forever by the interposition of a microscopic stool of an infinitesimal toad!

FAREWELL TO MAY.

AMONG the falling apple flowers
The mated robins sing;
The hyacinths are fading fast—
It is the last of Spring;
Its sweet, last day! "Oh, why,
Fair maiden May," we sigh,
"Wilt thou not linger?" Hush! for June
Delays until she goes;
And we must see the violets fade
Before we pluck a rose.

'Tis only losing we can win,
And giving we can take;
Our pleasures, tarrying too long,
Our sorest trials make.
The hearts that grieve to lose thee, May,
Would sorrow more to have thee stay.
Farewell, farewell, then, gentle Spring!
Our blessing with thee goes;
Above the withering violets
We see the opening rose!

THE STORY OF SIX WEEKS.

I HAD lived my life of twenty years in the cathedral town of which my father, Doctor Dennet—Doctor of Music—was the renowned organist: lived it quietly and uneventfully, when a change came that wrested my girlhood from me, and made me what I am now—a woman of the world.

My father was not only a renowned organist, but he was a very justly celebrated teacher of music, and an author of considerable repute. The subjects on which he chiefly exercised his pen were connected with the science of the art he loved so well. His treatise on thorough bass and his essay on harmony marked an epoch in the musical literature of our country; consequently his position socially was very superior to that which was ordinarily held by organists, however proficient, thirty years ago.

Doctor Dennet being what he was, I, his only daughter, was early imbued with a great loving admiration for the literary part of his profession—an admiration that roused the spirit of emulation which is inherent in every feminine breast, and made me, too, long to make something or somebody “famous by my pen.”

Though we were living a hundred miles from London, which was then, as now, the great centre of literary and artistic life and activity, still we were held to be within reach by many of those who were giants in those days. As a curly-headed, starry-eyed little child, I was accustomed to be patted on the head by the men whose names were familiar as household words to the great masses of the cultivated British public. And as a young girl I was suffered, even encouraged, to throw myself into all the intellectual discussions which took place at our house with interest and avidity.

The scribbling *dementia* seized me at a very early age. But my crude and immature efforts were wisely condemned to the flames by my father, who spared no pains in cultivating my taste and widening my understanding. I was a voracious and insatiable reader, and the limits he set to my range were so wide that I never transgressed them: a course I recommend to every parent who values the integrity equally with the intellect of his child. The result of his method with me was that when, at twenty, a tale in one volume of mine was published, it was received with a consideration by the critics that *he*, the most valued of them all, avowed to be no greater than its merits deserved.

I was a very happy girl when I first felt myself authorized to write my imaginative ideas and make them public. Here, I thought, was a fathomless well of delight—a never-ending panorama of bliss stretched around me on all sides. “Whatever comes,” I told myself, “I shall always have this to turn to for comfort.” And this was very remunerative too; for, girl as I was, I had touched a chord in people that thrilled most responsively.

About this time a friend of mine, some five

years older than myself, who was suffering greatly in body and mind, was ordered to a quiet West-of-England watering-place by her medical attendant. She was that most miserable of all women, a deserted, unloved wife; and about the time of which I write she had been compelled by her own family to institute legal proceedings against her husband with a view to obtaining a divorce. He had openly left her, and another woman was living with him as his wife; therefore my poor, unhappy friend, Mrs. Bellamy, had a strong case to go into court with, and naturally won it.

We reached Dawlish the last day of July, and took up our abode in quarters that had been secured for us in a whitewashed cottage-villa that stood some way back from the sea, on the bank of that trickling “Dawlish-water” which so exquisitely divides the two portions of one of the prettiest places on the coast of Devon. And here, the following day, we quite settled down comfortably to our several occupations in our respective sitting-rooms; for my father had counseled me never to give up the boon of many hours’ solitude every day, for reading and writing purposes, while I could secure it.

Behold us, then, as we were in those days at the commencement of the six weeks whose story I am about to tell. Flora Bellamy lying on the sofa, with a newspaper in her hand (she could not concentrate her attention on any thing of a less ephemeral nature), in a loose white wrapper trimmed with ribbons as blue as her eyes; a sweet, pale, Madonna-faced woman, with soft, shining bands of nut-brown hair brought low on her forehead; with a form that was meant by nature to be rounded and generously full, but that was now attenuated by anxiety and suspense; a woman with a voice like a silver bell, and with a manner that was full of little subtle flatteries and caresses to those about her. Altogether a decided contrast to myself. I had inherited from my mother, who died when I was a child, and who had been married and idolized for her almost Cleopatra-like beauty, a fiery ardor of purpose, which expressed itself in my physique. Though not above the middle height, I always gave people the impression that I was tall, in consequence of the way I had of holding myself very erect, and keeping my head rather thrown back. The bronze-brown hair, that had been curly when I was a child, was only wavy now; but it was long and luxuriant, and I wore it rolled in soft coils round my head in a way that was unusual then, when leech-like curls, or braids brought down low on the cheek in a line subversive of all beauty, were the fashions that obtained. My face was a small oval, and I had a clear, glowing, almost olive complexion, that gave me a southern look, which was intensified by eyes of so dark a violet that they were often mistaken for black.

I was very busy in my own room the morning after our arrival at Dawlish, when I heard Flora’s voice feebly calling me by name: “Frances, Frances, here’s a surprise!” I went in to her

at once, and she handed the *Dawlish Gazette* to me. "Look among the arrivals at the Royal Hotel," she said, "and you will see the names of Mr. and Mrs. Winstanley, from the Isle of Wight. They're my uncle and aunt."

"I suppose you are glad," I said, half discontentedly. "For my part, I'm sorry; they'll break up our quiet."

She smiled at my impatience. "When they know what your employments are they won't disturb them," she said. Then she went on, sadly: "Poor things; ours will be a miserable meeting, for it was at their house I met Captain Bellamy, and from their house that I married him. We haven't met since my misfortunes." Then she shed a few tears, and I kissed her, and pitied her, and went back to my story in hand, to pen a sentence eloquent in its indignation against man's heartlessness. Unconsciously I was working some of the facts of my friend's case, or, rather, some of the fancies I had about it, into fiction.

My name was becoming known as a contributor to one or two of the leading periodicals of that day; and when I went in to luncheon I was in high spirits, for I had just finished and posted a story into which I had thrown all my young nerve and vigor. "How happy it makes you, Frances," Flora said, half enviously; "you will always be able to shake off trouble, even if it comes upon you. What puzzles me is, how you can write love-stories when you have had no love experiences; at least, I don't know of your having had any: have you?"

"None," I said, shaking my head, and laughing and blushing at having to make a confession of being unwooed as well as unwon.

"I suppose, as you have finished your tale of bricks for the day, you won't mind going with me to call on the Winstanleys this afternoon, will you, dear?"

"I shall be delighted," I said; and accordingly we went.

The meeting between the uncle and aunt and their poor deserted young niece was a heart-rending one. They were old people; and great grief, when expressed by old people whose feelings ought not to be harrowed up, is a very sad thing to witness. They evidently loved her as a daughter, and smarted, as parents might, at the slights and injuries she had received. I left them alone after a short time, and went out for a walk on the sands by myself. Lured on now by a piece of sea-weed, now by a crested wave, now by a swooping gull, and generally by the extreme beauty of the day and scenery, I found myself at length close to Teignmouth, and very tired. Taking out my watch I found that I could not possibly get back to Dawlish by our dinner-hour, seven o'clock; and being hungry, and accustomed to act for myself, I went into a pastry-cook's, on the Dea, and ordered a plate of cold chicken and ham and a glass of wine.

While I was eating it, and laughing to myself over the unorthodox nature of my repast

and the state of consternation that Flora would be in, a gentleman sauntered into the shop and called for sherry and soda-water. Yes; He has come on the stage at last. In the story of *Six Weeks* it was inevitable that "He" must appear sooner or later.

He was a young, handsome, fair man—bronzed, apparently, by a foreign climate, but with crispy, blonde hair and large, light blue eyes. He was fashionably dressed in a morning costume, and struck me altogether as being better style than any one else I had seen down here. I knew that both Dawlish and Teignmouth were full of visitors, and adjudged him at once to be one of these latter, and not a son of the soil.

Presently I had to pay for my refreshment, cease from my speculations respecting him, and start on my homeward walk. I caught a glimpse of myself in a large pier-glass as I walked out of the shop, and I blushed a gratified blush at perceiving how very pretty I was looking. Aspiring authoress as I was I was always quite alive to the claims of the toilet, and to-day my brown holland dress and jacket, thickly braided with white, and my little cavalier hat and feather, were particularly becoming to me. (N.B.—I was very much given in those days to making myself the ground-work, as it were, of every heroine, until my readers must have been rather tired of my bronze-brown hair and vivacious expression.) That parting glance sent me out on my homeward walk with a brighter red in my cheeks, and a quicker throb at my heart, and a greater spirit of conjecture rife in me as to whether that man had thought as well of me as I had thought of him.

Glancing back once as I was pausing to look at the gallant "white horses" that were coming rolling in, I saw that he was behind me, walking along leisurely, oblivious of me in a well-bred manner, as if we had been in Regent Street.

He passed me presently, walking with a slinging stride that showed off his fine athletic figure admirably. I began to wonder about him. Who and what was he? Had he a wife, or a love, or was he fancy-free yet? What had brought him to Dawlish? for he looked in perfect health—very far from needing the restoratives of sea-air. Above all, was I seeing the last of him now as he turned the corner of that jutting rock and passed out of sight?

It was nearly half past eight when I reached home, and Flora was, as I had anticipated, in despair. "I made sure you had got on that sea-wall and fallen into the water. Never do it, Frances. I have been in an agony, and have begun a hundred letters to your father in imagination, telling him of your accident." Then she forgave me, and I told her "my adventure," as I termed it already.

I noticed that the interest she took in my recital was of a very flaccid order, and when I had concluded she explained why it was so by saying:

"I have hardly heard a word, dear; I have been thinking so much about the Winstanleys."

"Are those old people alone?" I asked.

"No; their son is with them for six weeks. Such a dear fellow he is, or used to be, when I knew him. He's a clerk in the Treasury."

"Did you see him to-day after I left?"

"No; he was out." Then she leaned back and closed her eyes, and appeared to go to sleep; and I quietly went off to read for a couple of hours.

I was engaged at that time in a course of reading which interested me deeply, namely, the biographies and principal works of the dramatists of the seventeenth century, with a view to writing a series of essays on them. I meant this to be my next literary work, and was bending my mind very earnestly to the task that was really a labor of love for me; and so my "two hours" prolonged themselves far into the night. When I rose up at last, wearied and heated, to go to bed, I opened the window and leaned out for a minute or two to refresh myself, and there, just opposite to our house, smoking a cigar, and apparently watching Dawlish-water as it trickled by, was the gentleman I had seen that afternoon.

The natural frivolous, girlish thought that came into my mind at once was: "He noticed me more than I thought; he has been watching me while I have been reading." In another moment I had softly closed the window, drawn the curtains, and crept up to bed.

The next day I was introduced to him as Mr. Augustus Winstanley, and the romance of my life began.

It came to pass that he was with us a great deal, for he was Flora's first-cousin, and so no difficulties intervened in the way of our meeting. He had that gentle, deferential manner which is so winning to women; and he contrasted vividly with the men I had known previously, who had been men of learning and of letters, and not men of fashion. My fever of first love was soon at its height. Frequently he was my sole companion, for Flora was too weak to sit out upon the sands for hours as we did; and then I would be steeped in a delicious stupor, from which I would rouse myself with a start to remember that I was passing another idle day, and that my knowledge of the dramatists of the seventeenth century was not deepening. I could not concentrate my thoughts or attention on any thing but him. My books and my pen were alike neglected. I felt that all my former pictures of love had been empty and expressionless, no more like the real thing than I was like my former self. I arose from dreams of him to long to see him so fervently that I could not eat my breakfast. I was wildly impatient for our morning walk, that we might meet him; that I might hear the sound of his voice, and feel the touch of his hand for one moment. When Flora would say, "Frances bears the interruptions that I have brought upon her so much better than I thought she would, Gus," I used to feel my face burn with the thought that he was reading my feelings,

and knew the reason *why* I bore them so well, and appreciated it. In vain I struggled against the infatuation. It grew upon me; and when at the end of a fortnight he was called to town for a few days, the world seemed to have grown suddenly dark.

Even during these few days of his absence I could not resume the avocations in which I had but the other day delighted. I gauged all things by his taste now, and with all his delicate attentions to me he had never shown any interest in my literary efforts. Indeed the night before he left, when we had all been down on the beach together, he had taken my hand that was covered with sand and sea-weed, and said: "I would rather see this bit of a hand in this state than with one spot of ink on it."

"But I never ink my fingers," I had expostulated.

"Don't you? I thought authoresses always did; inked their fingers and wore dowdy dresses, and were generally regardless of their personal appearance," he said, laughingly.

"Ah, vanity is not extinct in me," I said, gayly; but gayly as I spoke I felt a pang that he should, even jestingly, suppose that I should grow dowdy and unattractive.

It was of no use! I could not write or read, or *think* of any thing save him. His absence gave me no more time than had been my portion while he was at Dawlish. That unruly palpitation of the heart which made life seem one throb to me now effectually prevented my "inking my fingers" or doing any thing else that involved mental labor. In vain my father wrote to me and besought me to "report progress." In vain he and other old friends of mine sent me tempting packages of books fresh from the binder's hand. I could only think of my love, and as I could neither read nor write of it, I would not read nor write of aught else.

What chivalric, feminine, feeble plans I made in those days to be sure! I was going to work in secret (when I could command time and my own feelings) until I made myself famous, and then I was going (figuratively) to lay that fame at his feet. I resolved to deck myself in the brightest and most attractive garbs of the period—not out of vanity, but out of my intense feminine desire to appear fair in his eyes. He was not a rich man—he had told me this in the course of conversation about nothing particular on more than one occasion himself; I would work for him! "He was in no haste to marry," I had heard his mother say; I would wait for him. Meanwhile I dreamed and idled away my time, and became captious in my demeanor toward Flora.

"You're a little humbug, like the majority of girls, after all, Frances," she would say to me. "You profess to be earnest and busy and absorbed in your books and literary pursuits when you're with people with whom such professions take, but directly you get away from them you're as absolutely idle as mindless me;

much you have got up about the dramatists of the seventeenth century since you have been here, for instance!"

"I must have time to digest what I have read before I begin writing about it—even you will allow that," I retorted.

"The process of digestion is a rather long one," she said, dryly. "However, all I can hope is that your fit of masterly inactivity will last—it gives me more of your companionship."

The day after this conversation he came back to Dawlish, and the old habits were resumed. Flora seemed to me to give way daily more and more to the languor under which she was laboring, and Mr. Winstanley and I were thus thrown more and more together without the saving presence of a third.

"How much longer are you going to remain at Dawlish?" he asked me one evening when he had persuaded me to step out through the French window of Mrs. Bellamy's sitting-room and walk up and down in front of the house, while Flora tried to recruit her strength by a sleep on the sofa.

"How much longer? Oh, three weeks I believe," I said.

He paused, and, by the light of the moon, made an entry in his note-book. Then he laughed and rejoined me, and I asked him what he was taking notes about.

"Before you leave Dawlish I am going to take a most important step—the most important a man can take, I think," he replied. And then he offered me his arm, and as I laid my hand upon it he said:

"I registered a vow to take this step under the purest light that can shine upon the world; that ought to be a good omen, ought it not? Tell me, you little romancist?"

I trembled in every limb, but I steadied my tongue to say,

"I think so;" and soon after that, with my heart full of happiness, we went in to tea, and by-and-by Flora roused herself and sang to us, and I sat in the shade of the window curtains and thought how I loved him! how I loved him! and how worthless every thing else in the world was compared to that love.

The next day my father sent me a copy of a new work by a lady who justly ranked highly in the literary world. We all read the book with interest, and it pained and surprised me to hear him presently speak of it with an expression of strong distaste.

"Thank the Lord she isn't my wife!" he said.

"Would you not be proud? Oh, you *would* be proud of her!" I ejaculated, impetuously, while Flora laughed.

"Not a bit of it. I'm of the opinion of the old fellow in 'The Last of the Barons,' who says it's enough for a gentlewoman to know how 'to spin and be virtuous.' You say this book has been 'well received.' Heavens and earth! I should go mad to read even favorable remarks made by cads of the press about my wife; such 'fame' would be infamy to me."

He spoke very strongly and earnestly, and I abjured literature at once. The following day I wrote and told my father that, "on further consideration, I did not deem myself competent to undertake the task of critically reviewing the lives and writings of the dramatists of the seventeenth century;" and then I went on to add, in a very priggish way, that "I thought a woman should never strive to shine out of her own domestic sphere." My cheeks burned as I reflected on what would probably be my father's facial and verbal expression as he read this twaddle; but they paled directly afterward with the delicious pallor of love as I thought of how perfectly and entirely Mr. Winstanley would agree with my sentiments.

I could fill three volumes easily with a history of the thoughts and emotions that went to the making up of the sum of the days of the remaining three weeks. But I find it difficult to indicate, much less to fully express them, within the limits of a short story in one chapter. Probably that I am restricted to these limits is a boon and a blessing to my readers, to whom the subtle analysis of a young girl's heart might not be an attractive thing. However that be, the onus is upon me of doing the best I can for and with my materials and the space they may occupy.

Dawlish-water! Dawlish-water! how many silent vows you must have felt me utter as I strolled along your brink, in a state of intellectual coma, in the soft, warm evening air! I was going to be such a wife, such a household treasure, and domestic goddess! I was going to sacrifice myself in every way. Had I not already offered up my schemes of ambition on the altar of his high-minded and refined (?) prejudices? What a fool I was! But still, "for a' that and a' that," I would rather my daughter should develop into such another confiding fool than that she should grow up a prudent, calculating girl, distrusting every thing save expediency.

My heart thrilled as it took in and appreciated the perfect approbation with which the old Winstanleys regarded our intimacy. I could not be blind to their palpable observance of all that was going on. They joked me delicately and mildly about the hardship it would be to "Gus," as they all called him, to return to his official duties. They bade me arrange our little daily schemes of pleasure with him. They presupposed my interest in all that concerned him—in the property that would be his, the family connections, the prospects of promotion. In short, they identified me with him completely. And still Flora made no sign of seeing any thing or suspecting any thing. I lived a lifetime in those few weeks. He revolutionized all my ideas, and reorganized them, without seeming to trouble himself much. He taught me to think lightly of those I had hitherto revered or admired: taught me to think lightly of them, not by abusing them, or even laughing at them, but simply by letting me understand that he had

never heard of them; that they were not in his world; that they were outside and utterly beyond the pale of his sympathies. "Where do those fellows put themselves?" he would ask, in accents of most sublime indifference. "They never go any where. I don't meet them." When he would say that, I, weak woman that I was, would blush for my former friends—for the men who could not pervade the pitiful haunts of fashion, not for Mr. Winstanley.

How did he obtain this influence over me? I was infinitely cleverer than he was; and I knew, at the time that I was most abject to him, that I was the cleverer of the two. And yet, for all this knowledge, he had the power over me of putting me down or lifting me up just as he listed. I loved him, and believed that he would make me happy by-and-by when I should be wholly his, though he did not make me happy now. Fond, futile, foolish belief, born of that besotted credulity which submerges the intellect of the cleverest woman when once Love saps her strength!

I think one of his charms to me was his invincible good temper. Nothing fretted him. He was never peevish and irritable about trifles; and there was a great charm to me in this, for I had frequently winced under a sense of incongruity when I had witnessed a fit of petulance in some man whose strength on some given subject was as the strength of ten. Gus Winstanley's good temper was proverbial. Inferiors, servants, satellites of all kinds adored him. He had the winning word and the winning way. Little children worshiped him, and pestered him with their little attentions; and it seemed to me so grand a thing on his part to be so condescending that I followed the example of the little children as far as worshiping him too went.

One night—the night before his six weeks' leave of absence from the Treasury expired—he came in just as we were about to sit down to dinner, with some message from his mother—some message which involved the necessity of Flora going over to her aunt and giving a verbal reply. Mrs. Bellamy made a little face, expressive of dissatisfaction at this necessity; but at last gave way to it affably, saying that if he would stay and dine with us, and escort her to his mother afterward, she would go without a murmur. And when he agreed, she said: "And while I am with aunt, you must come back and take care of Frances, Gus." And as he acquiesced in this arrangement, I felt that my fate would be sealed that night.

What a dinner that was! The viands and wine were food and nectar fit for the gods, I felt. It came to an end at last—not a bit too soon for me, though, for I was longing for Flora to go away, and for her cousin to come back and tell me the story of his love. I had a strong presentiment that I should hear it that night; and I did hear it.

They made a charming picture when they stood in the lamp-lighted room just for a mo-

ment previous to going away. Flora had thrown a black lace mantilla over her head, and her fair beauty shone out from its folds like a rose. He stood by her trying to help her adjust it. Such a fine, stalwart, splendid-looking young Englishman! My heart beat with pride as I looked at him, and I felt how inferior all the literary triumphs I had once hoped to gain were to the hope I now had that he was going to crown me with the avowal of his love.

I watched them from the window as they went away from the house—Flora, with her always faltering steps, resting and steadying herself on his arm. "She will be *my* cousin soon," I thought, affectionately; and I was glad that she was so lovely, in order that I might feel that he had deemed my charms superior to hers; for was she not free to be chosen and wooed now?

He came back in about twenty minutes, looking agitated, and he joined me at the window at once. "Tell my fortune by the stars," he said, abruptly; "tell me; shall I be fortunate in all I am going to seek to-night? I should like you to be the sibyl to prophesy good fortune for me."

"If I were you I should have no doubt, no fear, no misgiving," I said, trying to laugh as I looked up at the shining worlds above us, and pretended to humor his fancy. Then I turned away and seated myself at a little distance, for he was nothing to me yet, while to my heart he was every thing.

"Sing to me, will you, Miss Dennet? sing that 'Message' of Blumenthal's, or the 'Beloved Eye, beloved Star,' that I heard you singing like an angel the other night," he said, following me, and compelling me to meet his eyes.

"It was Flora you heard singing that," I stuttered. "Don't make me sing, Mr. Winstanley; don't ask me to sing," I went on pleading.

"Then talk to me!" he exclaimed. "For God's sake don't let me stand still and think!"

Startled and frightened by I knew not what, with all my faculties strung up to the uttermost by hope and love and expectation, and yet with a dull, deadening possibility of despair and disappointment hanging over me, I still strove to obey him. I tried to talk, but I could not. My mind and my tongue both refused to act; and at length both of us went to the window again, and stood there looking out, steeped in silence.

Was he mad? Was I a fool? Had he played with me? Had I deceived myself? I asked myself these and a hundred other kindred questions as I stood there during the awful ten minutes that ensued. Then he spoke. "Have I been here with you half an hour, Miss Dennet?" he asked, quickly.

I shook my head.

"Heaven be merciful, how the time lags!" he muttered. "I have permission to go for her to hear my sentence in half an hour from

the time of my coming back here." Then he commenced walking up and down the room, and I stood still in dumb despair.

Presently he came up to me.

"You have always been my friend; always aided me in seeing her, for of course you saw—"

I interrupted him with an ejaculation: "Oh, Mr. Winstanley, don't say I have done any thing—*please don't!*"

"You have only done what all good women do at some time in their lives," he said, looking impatiently down in the direction where his mother lived. "You have helped on a true love affair; I can't stand this any longer." Then he seized his hat and rushed out of the house, and I was left alone to ponder over his words, and to make what I could out of them and his actions.

What true love affair? Whose true love affair had I "helped on." My own? No, not my own, not my own! I realized this in a momentary burst of such agony as I can never feel again; because, you see, *this* was the waking from my first, my freshest love-dream. Then I sat down in a deep lethargy of pain, to wait for what would come next; and to remember how shamefully, how vainly, I had wasted my precious hours of youth and health and strength at Dawlish.

I will finish the story; I will tell out the tale of my disappointment and mistake, and their mutual love and happiness. They came back by-and-by. His mother—her aunt—had not added her solicitations to her son's in vain. They came back together, happy, betrothed, to tell me that he had loved Flora before she became Mrs. Bellamy, and that her divorce had been the signal for him to attempt to rehabilitate his happiness. She had had scruples for a long time. Especially had she deemed it probable that her aunt would not approve of such a marriage for her son. But the aunt had banished all these scruples during that long interview they two had had this night. And they were engaged, and very happy now.

He went back to town the next day, radiant, better tempered, and more agreeable than ever. I staid with Flora till her health was quite restored, and then I went back to my home.

It was a long time before I took an interest in any of my old pursuits. The ghost of that feverishly happy time at Dawlish would rise up and mock me so cruelly. But our best friend Time has brought me to feel that I may do some good in my generation still, though it will not be as a wife; which is a conclusion I should have deemed it a very sad thing to come to before those six weeks at Dawlish.

BORDER REMINISCENCES.

By RANDOLPH B. MARCY, U.S.A.

XVII.—STORY OF MRS. L.—'S CAPTURE AND ESCAPE.

THE verity of the somewhat paradoxical adage that "truth is sometimes stranger than fiction," was never more strikingly presented to my mind than upon an occasion when listening to a detailed account of the capture by the Comanches of a woman upon the Texas border, and the unparalleled achievements, sufferings, and fortitude connected with her captivity and her subsequent escape therefrom.

In order that the reader may get a full understanding and appreciation of the facts as they occurred, a few explanatory observations upon the peculiar features of the country where the scenes were enacted, and the character of its population, seem indispensable.

Before the inhabitants of Texas surrendered the sovereignty of their republic, by contributing their rising "lone star" emblem to swell and emblazon the constellation of the glorious Union galaxy, and, indeed, for many years previous to the achievement of their independence from Mexican rule, they were continually subjected to the merciless and bloody incursions of those barbarous freebooters of the plains, the Comanches and Kiowas, who have to this day kept up their outrages upon the border occupants of that State, in absolute defiance of all the efforts of our government to prevent them.

They have repeatedly been informed by our

authorities that Texas has become incorporated into the Union, that we are now one and the same nation, and that they would not be allowed to make any discrimination between the people of the two sections. Yet they do not seem to comprehend the existing relations, and the antagonistic attitude assumed by Texas toward the United States during the rebellion, which the Indians were perfectly cognizant of, only served to confirm their previous impressions, that there was no real national unity established between us.

These nomads range over a vast extent of country about the waters of the Arkansas and Red rivers, hundreds of miles removed from all white settlements; and in this unfrequented district they leave their women and children while absent upon protracted raids into Texas and Mexico.

In the execution of their atrocious ravages they are always well mounted, and pass stealthily along outside of the populated sections of the country, until they learn from their scouts when a favorable opportunity offers for the accomplishment of their purposes, when, like tigers pouncing upon their prey, they swoop in upon their unwary victims, murdering and scalping the men, and making captive the women and children, whom with their booty they carry hurriedly away to their distant haunts, where it is impossible to track or pursue them.

The chronicles of the wars between the early colonists of New England and the aborigines abound in thrilling narrations of heroic deeds and sufferings, of miraculous escapes from torture and the stake, as well as of the marvelous fortitude and courage evinced upon many occasions by the women of that eventful era; but I have yet to learn any thing, either from history or romance, that impressed me as being more remarkable or more deserving of commendation than the signal exploit of mental and physical valor and endurance which I am about to relate, and which can substantially be vouched for by several creditable living witnesses.

Beyond the extreme outer line of settlements in Western Texas, near the head waters of the Colorado River, and in one of the remotest and most sequestered sections of that sparsely populated district, there lived, in 1867, an enterprising pioneer by the name of Babb, whose besetting propensity and ambition consisted in pushing his fortunes a little further toward the setting sun than any of his neighbors, the nearest of whom, at the time specified, was some fifteen miles in his rear.

This proximity did not afford him quite as much "elbow-room" as he would have desired, for he was decidedly averse to human attrition, and the jostling consequent upon closely packed communities; but he was a kind and indulgent husband, and cheerfully suffered this little inconvenience for the gratification of his better half, who was rather more fond of society than himself, and objected to going any farther away from the settlements.

The household of the borderer consisted of his wife, three small children, and a female friend by the name of L—, who, having previously lost her husband, was passing the summer with the family.

As this woman is the heroine of our narrative, and performed a conspicuous rôle in the exciting scenes I shall attempt to depict, a brief description of her person and characteristics seems to be apropos in this connection.

She is represented as having been, at the period alluded to, about twenty-five years of age, with an erect and somewhat commanding presence, but possessing eminently a graceful feminine person of rather less than medium proportions; yet she was no delicate, ethereal, hot-house exotic, who required constant shelter and protection from every unusual atmospheric asperity. On the contrary, she was a veritable type of our vigorous, self-reliant, border women, who encounter danger or the vicissitudes of weather without quailing.

Born and nurtured upon the remotest frontier, she inherited a robust constitution, and her active life in the exhilarating prairie air served to develop and mature into perfect symmetry and beauty a healthy womanly physique, which is rarely met with in the impure and enervating atmosphere of the cities.

The contour of her naturally graceful figure had not been squeezed and warped by those in-

struments of torture called corsets, into an outline entirely at variance with the inimitable model designed by the Almighty in his own perfect image; neither had she sacrificed her natural hair to the feverish, steaming ordeal of attaching to the back of her head a fish-net, stuffed out with a huge coil of flax or defunct hair cable. She was no slave to such senseless and disgusting mandates of fashion, and suffered her long glossy locks to hang in massive waving curls all over her shoulders.

Her features were regular and classic, and the glances from her jet-black eyes, surmounted by exquisitely penciled brows, were, when she was excited, as vivid and piercing as the dazzling scintillations from calcium lights.

Her complexion did not carry that pallid, sickly hue so characteristic of city women; neither had she been inducted into the mysteries of rouge, cosmetics, or other appliances of the toilet; for her cheeks required no such artificial adornment. By constant impact with the salubrious prairie breezes they had become tinged with a shade of rich brown, and when under the influence of excitement or exercise, the rapid pulsations of crimson pigment, which flashed from her heart beneath her transparent skin, rendered her complexion more beautiful than any thing within the power of art.

Her costume was designed and made for comfort and use, without regard to the arbitrary dictates of fashion. There were no elaborate puckered frills, flounces, furbelows, or dromedary-like humps to load down or deform her person; nor was the crown of her head surmounted by a Tyrolese doll's hat; yet the *toute-ensemble* of her limited wardrobe was comely and appropriate.

Besides her other personal attractions she is said to have possessed a large element of vivacious, social *bonhomie*—a spontaneous Di Vernon-like abandon, which attracted and fascinated all who came within the sphere of its influence.

She probably seldom, if ever, during the entire course of her life, rode in a carriage; and the only means of locomotion familiar to her, aside from that bestowed upon her by the Creator, was upon horseback.

At an early age she had been taught to ride, and in after-life it had been one of her chief sources of pleasure to mount her horse in the cool of the morning, and gallop away for miles over the verdure-clad expanse of the plains, where the spicy aroma from an ocean of fragrant flowers saturated the entire atmosphere with a pungent and exhilarating perfume, and where her free, independent, and fearless nature had ample scope.

In the saddle she felt perfectly self-confident; and while dashing at full speed over the gentle undulations of the prairie upon her favorite horse, her long locks streaming in unconfined luxuriance in the breeze, and her lithe, supple person yielding in centaur-like unison with every movement, pulsation, and breath of the

generous animal that shared her enthusiasm, she presented an equestrian model of bewitching beauty and grace.

The cares, perplexities, and luxuries of civilized society were unknown to her, yet she was contented and happy; and here she would probably have passed the remainder of her days had nothing occurred to break in upon the monotony of her career.

But, alas! like the capricious mutations of all other human calculations, the current of her peaceful and innocent avocations and pastimes was destined soon to encounter a most abrupt and unforeseen interruption, the details of which will constitute the burden of the following narrative, which was related to me by the agent of the very Indians concerned, and may therefore be relied upon for truth and accuracy.

Upon one bright and lovely morning in June, 1867, the adventurous borderer before mentioned set out from his home with some cattle for a distant market, leaving his family in possession of the ranch, without any male protectors from Indian marauders.

They did not, however, entertain any serious apprehensions of molestation in his absence, as no hostile Indians had as yet made their appearance in that particular locality; and every thing passed on quietly for several days, until one morning, while the women were busily occupied with their domestic affairs in the house, the two oldest children, who were playing outside, called to their mother, and informed her that some mounted men were approaching from the prairie. On looking out she perceived, to her astonishment, that they were Indians coming upon the gallop, and already very near the house. This gave her no time to make arrangements for defense; but she screamed to the children to run in for their lives, as she desired to bar the door, being conscious of the fact that the prairie warriors seldom attack a house that is closed, fearing, doubtless, that it may be occupied by armed men, who might give them an unwelcome reception.

The children did not, however, obey the command of their mother, believing the strangers to be white men, and the door was left open. As soon as the alarm was given Mrs. L—— sprang up a ladder into the loft, and concealed herself in such a position that she could, through cracks in the floor, see all that passed beneath.

Meantime the savages came up, seized and bound the two children outdoors, and entering the house, rushed toward the young child, which the terror-stricken mother struggled frantically to rescue from their clutches; but they were too much for her, and tearing the infant from her arms, they dashed it upon the floor; then seizing her by the hair, they wrenched back her head and cut her throat from ear to ear, putting her to death instantaneously.

Mrs. L——, who was anxiously watching their proceedings from the loft, witnessed the fiendish tragedy, and uttered an involuntary shriek

of horror, which disclosed her hiding-place to the barbarians, and they instantly vaulted up the ladder; overpowered and tied her; then dragging her rudely down, they placed her, with the two elder children, upon horses, and hurriedly set off to the north, leaving the infant child unharmed, and clasping the mangled corpse of its murdered parent.

In accordance with their usual practice, they traveled as rapidly as their horses could carry them for several consecutive days and nights, only making occasional short halts to graze and rest their animals, and get a little sleep themselves, so that the unfortunate captives necessarily suffered indescribable torture from harsh treatment, fatigue, and want of sleep and food. Yet they were forced by the savages to continue on day after day and night after night for many, many weary miles toward the "Staked Plain," crossing *en route* the Brazos, Wachita, Red, Canadian, and Arkansas rivers, several of which were at swimming stages.

The warriors guarded their captives very closely until they had gone so great a distance from the settlements that they imagined it impossible for them to make their escape and find their way home, when they relaxed their vigilance slightly, and they were permitted to walk about a little within short limits from the bivouacs; but they were given to understand by unmistakable pantomime that death would be the certain penalty of the first attempt to escape.

In spite of this, Mrs. L——, who possessed a firmness of purpose truly heroic, resolved to seize the first favorable opportunity to get away; and with this resolution in view, she carefully observed the relative speed and powers of endurance of the different horses in the party, and noted the manner in which they were grazed, guarded, and caught; and upon a dark night, after a long, fatiguing day's ride, and while the Indians were sleeping soundly, she noiselessly and cautiously crawled away from the bed of her young companions, who were also buried in profound slumber, and going to the pasture-ground of the horses, selected the best, leaped upon his back, *à la garçon*, with only a lariat around his neck, and, without saddle or bridle, started quietly off at a slow walk in the direction of the North Star, believing that this course would lead her to the nearest white habitations. As soon as she had gone out of hearing from the bivouac, without detection or pursuit, she accelerated the speed of the horse into a trot, then to a gallop, and urged him rapidly forward during the entire night.

At dawn of day on the following morning she rose upon the crest of an eminence overlooking a vast area of bold prairie country, where, for the first time since leaving the Indians, she halted, and, turning round, tremblingly cast a rapid glance to the rear, expecting to see the savage blood-hounds in eager pursuit upon her track; but, to her great joy and relief, not a single indication of a living object could be discerned within the extended scope of her vision. She

breathed more freely now, but still did not feel safe from pursuit; and the total absence of all knowledge of her whereabouts in the midst of the wide expanse of dreary prairie around her, with the uncertainty of ever again looking upon a friendly face, caused her to realize most vividly her own weakness and entire dependence upon the Almighty, and she raised her thoughts to Heaven in fervent supplication.

The majesty and sublimity of the stupendous works of the great Author and Creator of the Universe, when contrasted with the insignificance of the powers and achievements of a vivified atom of earth modeled into human form, are probably under no circumstances more strikingly exhibited and felt than when one becomes bewildered and lost in the midst of the almost limitless amplitude of our great North American "pampas," where not a single footmark or other trace of man's presence or action can be discovered, and where the solitary wanderer is startled at the sound even of his own voice.

The sensation of loneliness and despondency resulting from the appalling consciousness of being really and absolutely lost, with the realization of the fact that but two or three of the innumerable different points of direction embraced within the circle of the horizon will serve to extricate the bewildered victim from the awful doom of death by starvation, and in entire ignorance as to which of these particular directions should be followed, without a single road, trail, tree, bush, or other landmark to guide or direct—the effects upon the imagination of this formidable array of disheartening circumstances can be fully appreciated only by those who have been personally subjected to their influence.

A faint perception of the intensity of the mental torture experienced by these unfortunate victims may, however, be conjectured from the fact that their senses at such junctures become so completely absorbed and overpowered by the cheerless prospect before them that they oftentimes wander about in a state of temporary lunacy, without the power of exercising the slightest volition of the reasoning faculties.

Such instances of mental alienation, as strange as it may appear, are by no means uncommon; and I have myself seen several persons whose minds for days, after having been lost and found, were greatly deflected from the channels of sanity.

The inflexible spirit of the heroine of this narrative did not, however, succumb in the least to the imminent perils of the situation in which she found herself, and her purposes were carried out with a determination as resolute and unflinching as those of the Israelites in their protracted pilgrimage through the wilderness, and without the guidance of pillars of fire and cloud.

The aid of the sun and the broad leaves of the pilot-plant by day, with the light of *Polaris* by night, enabled her to pursue her undeviating course to the north with as much accu-

racy as if she had been guided by the magnetic needle.

She continued to urge forward the generous steed she bestrode, who, in obedience to the will of his rider, coursed swiftly on hour after hour during the greater part of the day without the least apparent labor or exhaustion.

It was a contest for life and liberty that she had undertaken, a struggle in which she resolved to triumph or perish in the effort; and still the brave-hearted woman pushed on, until at length her horse began to show signs of exhaustion, and as the shadows of evening began to appear he became so much jaded that it was difficult to coax or force him into a trot, and the poor woman began to entertain serious apprehensions that he might soon give out altogether and leave her on foot.

At this time she was herself so much wearied and in want of sleep that she would have given all she possessed to have been allowed to dismount and rest; but unfortunately for her those piratical quadrupeds of the plains, the wolves, advised by their carnivorous instincts that she and her exhausted horse might soon fall an easy sacrifice to their voracious appetites, followed upon her track and came howling in great numbers around her, so that she dared not set her feet upon the ground, fearing they would devour her; and her only alternative was to continue urging the poor beast to struggle forward during the dark and gloomy hours of the long night, until at length she became so exhausted that it was only with the utmost effort of her iron will that she was enabled to preserve her balance upon the horse.

Meantime the ravenous pack of wolves, becoming more and more emboldened and impatient as the speed of her horse relaxed, approached nearer and nearer until, with their eyes flashing fire, they snapped savagely at the heels of the terrified horse, while at the same time they kept up their hideous concert like the howlings of ten thousand fiends from the infernal regions.

Every element in her nature was at this fearful juncture taxed to its greatest tension, and impelled her to concentrate the force of all her remaining energies in urging and coaxing forward the wearied horse until, finally, he was barely able to reel and stagger along at a slow walk; and when she was about to give up in despair, expecting every instant that the animal would drop dead under her, the welcome light of day dawned in the eastern horizon and imparted a more cheerful and encouraging influence over her, and, on looking around, to her great joy there were no wolves in sight.

She now, for the first time in about thirty-six hours, dismounted; and knowing that sleep would soon overpower her, and that the horse, if not secured, might escape or wander away, and there being no tree or other object to which he could be fastened, she with great presence of mind tied one end of the long

lariat to his neck, and with the other end around her waist dropped down upon the ground into a deep sleep, while the famished horse eagerly cropped the herbage around her.

She was unconscious as to the duration of her slumber; but it must have been very protracted to have compensated the demands of nature for the exhaustion induced by her prodigious ride.

Her sleep was sweet, and she dreamed of happiness and home, losing all consciousness of her actual situation until she was suddenly startled and aroused by the pattering sound of horses' feet beating the earth on every side.

Springing to her feet in the greatest possible alarm, she found herself surrounded by a large band of savages, who commenced dancing around, flouting their war clubs in frightful proximity to her head while giving utterance to the most diabolical shouts of exultation.

Her exceedingly weak and debilitated condition at this time, resulting from long abstinence from food and unprecedented mental and physical trials, had wrought upon her nervous system to such an extent that she imagined the moment of her death had arrived, and fainted.

The Indians then approached, and, after she revived, placed her again upon a horse and rode away with her to their camp, which fortunately was not far distant. They then turned their prisoner over to the squaws, who gave her food and put her to bed; but it was several days before she was sufficiently recovered to be able to walk about the camp.

She learned that her last captors belonged to "Lone-Wolf's" band of Kiowas.

Although these Indians treated her with more kindness than the Comanches had done, yet she did not for an instant entertain the thought that they would ever voluntarily release her from bondage; neither had she the remotest conception of her present locality or of the direction or distance to any white settlement; but she had no idea of remaining a slave for life, and resolved to make her escape the first practicable moment that offered.

During the time she remained with these Indians a party of men went away to the north, and were absent six days, bringing with them, on their return, some ears of green corn. She knew the prairie tribes never planted a seed of any description, and was, therefore, confident the party had visited a white settlement, and that it was not over three days' journey distant. This was encouraging intelligence to her, and she anxiously bided her time to depart.

Late one night, after all had become hushed and quiet throughout the camp, and every thing seemed auspicious for the consummation of her purposes, she stole carefully away from her bed, crept softly out to the herd of horses, and, after having caught and saddled one, was in the act of mounting, when a number of dogs rushed out after her, and by their barking created such a disturbance among the Indians that she was

forced, for the time, to forego her designs and crawl hastily back to her lodge.

On a subsequent occasion, however, fortune favored her. She secured an excellent horse, and rode away in the direction from which she had observed the Indians returning to camp with the green corn. Under the certain guidance of the sun and stars, she was enabled to pursue a direct bearing; and after three consecutive days of rapid riding, anxiety, fatigue, and hunger, she arrived upon the border of a large river, flowing directly across her track. The stream was swollen to the top of its banks; the water coursed like a torrent through its channel, and she feared her horse might not be able to stem the powerful current; but after surmounting the numerous perils and hardships she had already encountered, the dauntless woman was not to be turned aside from her inflexible purpose by this formidable obstacle, and she instantly dashed into the foaming torrent, and by dint of encouragement and punishment, forced her horse through the stream, and landed safely upon the opposite bank.

After giving her horse a few moments' rest, she again set forward, and had ridden but a short distance when, to her inexpressible astonishment and delight, she struck a broad and well-beaten wagon-road; the first and only evidence or trace of civilization she had seen since leaving her home in Texas.

Up to this joyful moment the indomitable inflexibility of purpose of our heroine had not faltered for an instant; neither had she suffered the slightest despondency, in view of the terrible array of disheartening circumstances that had continually confronted her; but when she realized the hopeful prospect before her of a speedy escape from the reach of her barbarous captors, and a reasonable certainty of an early reunion with people of her own sympathizing race, the feminine elements of her nature preponderated, her stoical fortitude yielded to the delightful anticipation; and her joy was intensified and confirmed by seeing at this moment a long train of wagons approaching over the distant prairie.

The spectacle overwhelmed her with ecstasy, and she wept tears of joy while offering up sincere and heart-felt thanks to the Almighty for delivering her from a bondage more dreadful than death.

She then proceeded on until she met the wagons in charge of Mr. Robert Bent, whom she entreated to give her food instantly, as she was in a state bordering upon absolute starvation. He kindly complied with her request, and after the cravings of her appetite had been appeased he desired to gratify his curiosity, which had been not a little excited at the unusual exhibition of a beautiful white woman appearing alone in that wild country, riding upon an Indian saddle, with no covering upon her head save her long natural hair, which was hanging loosely and disorderly about her shoulders, while her attire was sadly in need of repairs. Ac-

cordingly, he inquired of her where she lived, to which she replied, "In Texas." Mr. B. gave an incredulous shake of his head at this response, remarking at the same time that he thought she must be mistaken, as Texas happened to be situated some five or six hundred miles distant. She reiterated the assurance of her statement, and described to him briefly the leading incidents attending her capture and escape; but still he was inclined to doubt, believing that she might possibly be insane.

He informed her that the river she had just crossed was the Arkansas, and that she was then on the old Santa Fé road, about fifteen miles west of Big Turkey Creek, where she would find the most remote frontier house. Then, after thanking him for his kindness, she bade him adieu, and started away in a walk toward the settlements, while he continued his journey in the opposite direction; but he still followed the exit of the remarkable apparition with his eyes until she was several hundred yards distant, when he observed her throw one of her feet over the horse's back, *à la femme sauvage*, and casting a graceful kiss toward him with her hand, she set off on a gallop, and soon disappeared over the crest of the prairies.

On the arrival of Mr. Bent at Fort Zara, he called upon the Indian agent, and reported the circumstance of meeting Mrs. L——, and, by a singular coincidence, it so happened that the agent was at that very time holding a council with the chiefs of the identical band of Indians

from whom she had last escaped, and they had just given a full history of the entire affair, which seemed so improbable to the agent, that he was not disposed to credit it until he received its confirmation through Mr. Bent. He at once dispatched a man to follow the woman and conduct her to Council Grove, where she was kindly received, and remained for some time, hoping through the efforts of the agents to gain intelligence of the two children she had left with the Comanches, as she desired to take them back to their father in Texas; but no tidings were gained for a long while. Meantime she formed the acquaintance of a man at Council Grove whom, as I understood, she married, and for aught I know may be there yet. Wherever she is, I most heartily wish her all possible happiness.

The two captive children were, as the agent informed me, ransomed at a subsequent date, and sent home to their father.

It will readily be seen, by a reference to the map of the country over which Mrs. L—— passed, that the distance from the place of her capture to the point where she struck the Arkansas River could not have been short of about five hundred miles, and the greater part of this immense expanse of desert plain she traversed alone, without seeing a single civilized human habitation.

If any other woman, either in ancient or modern times, has performed as signal an equestrian achievement as this, I have yet to learn it.

ANTEROS.

BY THE AUTHOR OF "GUY LIVINGSTONE," "SWORD AND GOWN," "SANS MERCI,"
"BREAKING A BUTTERFLY," ETC.

CHAPTER XI.

THERE is this advantage about a multiplicity of grievances, that the sufferer seldom frets long over any single one. In the earlier part of that week Philip Ashleigh had several small worries, and these gradually thrust into the back-ground the danger that had appeared so formidable on Sunday, till he began to consider it rather an imaginary one. Indeed, he said as much to Marian, and, when she declined to agree that her suspicions might have been groundless, was exceedingly peevish, giving vent to some sharp strictures on women's fancies and the like.

Marian had scarcely been in her wonted spirits since that incident at the breakfast-table, and she did not feel up to futile arguments; otherwise, perhaps, her reply would not have been so meek.

"I dare say you are right, Philip," she said; "I am sure I hope so."

The which submission her husband accepted with a sniff of superiority.

The Wednesday's post arrived in due course,

and Lady Marian's letters were brought to her, as usual, before she rose. There were several, as it chanced, that morning; but her eye lighted at once on the one in Lord Atherstone's handwriting, and she snatched it up, casting the others aside. However, in despite of this apparent eagerness, she held it in her hand for a brief space before, with a kind of effort, she tore open the envelope.

A more useless faculty can hardly be imagined—for how can it profit us to guess at the truth a few seconds before we are certified thereof?—but it is odd how even obtuse people are clairvoyant in this especial line. Lady Marian had received perhaps a score of letters bearing the same superscription, and there was no sort of reason why this one should not, like the rest, have related merely to ordinary domestic arrangements; but that such was not its character she felt as sure before she broke the seal as when she had perused it to the last word. As she read it through very slowly her countenance betrayed neither anger nor surprise; but there came over it a certain malign look of which before you would not have deemed

it capable, and this abode there after she had laid the letter softly down, and while she leaned back musing, with eyes half closed. The news was not unexpected, of course: indeed, for three days past she had almost reckoned on receiving some such a missive; yet the blow came home none the lighter. Perhaps you have not realized yet why it stung Marian Ashleigh so keenly.

Though she had little personal ambition, she was intensely fond of power; it was not for ostentation's sake, or even with a view to any substantial profit, that she sought it. In the mere consciousness and exercise of authority lay her delight. The mistress of such a household as the Ashleighs might prudently maintain, would be a very different personage from the *châtelaine*—in fact, if not in title—of Templestowe. Only very weak or well-disciplined natures can adapt themselves to those rapid descents, even where there is no degradation, without a murmur.

When it was noised abroad in Elba that the dethroned emperor was already so reconciled to the change as to begin to busy himself with the economy of his island, those who had him in ward ought to have doubled their precaution; for that placability, if not a feint, must surely have sprung from the certain knowledge that the bark was even now hovering in the offing that would bear him away to make another rally for dominion. Since the days of Walworth has the civic chair been filled by one so stout or so humble of heart as to have met without one pang of regret the uprising of the ninth sun of November?

But howsoever Marian Ashleigh may have chafed at the thought that her reign at Templestowe was nearly ended, this was not the darkest element in her present discontent. Philip, as you know, always had a grievance on hand, with which his wife—in outward seeming at least—generally contrived to sympathize; but there was a grief—a common grief—concerning which the lips of both were sealed: the grief of a childless marriage. Though most of her husband's maladies were as imaginary as his other troubles, Marian knew very well that the father surviving the son was scarcely an improbability; and in such a case—supposing, further, that another heir to Templestowe should be born from Lord Atherstone's second marriage—what chance would there be of her ever being "brought back to her own?" Pondering over these things, it is no wonder if her countenance lowered. After a few minutes she arose without so much as glancing at the rest of her correspondence, and throwing on a wrapper, went into her husband's dressing-room hard by.

In that brief passage her face had nearly regained its usual composure; nevertheless, Philip, who was not particularly sharp-sighted, guessed what had happened before she laid the letter in his hand. He took it and read it through, as it were, mechanically, his jaw dropping lower and lower; and when it was finished,

looked up at his wife with a blank helplessness that was almost pitiable. Perhaps she so interpreted it, or perhaps she thought a triumph under the circumstances too trivial; at all events she refrained from the feminine formula of, "I told you how it would be," and spoke very gently and gravely.

"It sounds hard now that it has come, doesn't it, Philip; even though we were half prepared?"

As Ashleigh set his teeth together there was a look of his father about the lower part of his face—weak and inane enough as a rule—and his answer was almost inaudible; it would have been better had it been quite so, for the syllables that caught her ear made Marian shrink a pace backward.

"Hush!" she said. "Such language would be too wicked even if there were cause. Lord Atherstone has done no more than he has a perfect right to do—no more perhaps than we had a right to calculate upon. You can not deny that he writes kindly and generously, and even considerately—for him."

"Generously!"

The word came out like the spit of an angry cat. Marian saw that argument with her husband, in his present temper, would be purely wasted.

"I am sorry you take it so," she said; "it won't mend matters. Perhaps by breakfast-time you will be in a more rational frame of mind, and then you can help me to think how we can make the best of it. Now I am going to read my other letters; I hope some of them may bring pleasanter news."

Indeed, though he brought small appetite to his morning meal, Ashleigh had then so far recovered from the shock as to be able to discuss, in his own fretful, querulous fashion, their own prospects, and the probable character of the future Lady Atherstone, with whom, as it chanced, neither he nor his wife was acquainted.

But with such vague speculation it was not likely that one of Marian's character would rest content. Before noon—unknown to Philip—she had dispatched a note to a certain cousin in town, praying him to furnish her with all the reliable information that he could gather bearing on Lena Shafton's family and personal history.

She could hardly have applied to a likelier source. By dint of long service Archie Carnegie had risen high in the Foreign Office: perhaps he would have risen higher, by dint of merit, if he had devoted as much time and trouble and talent to the practice of his profession as he had bestowed on domestic diplomacy. There were very few stories of late years written in cipher to which he had not sooner or later gained the key. He was not a mischievous person, for he was too cautious to be a gossip, and too humane to be a tale-bearer; nevertheless, people were afraid of him, simply because he was supposed to know so much, and would liefer have offended many loud-voiced and bitter-tongued satirists than this placid phi-

losopher. As he read his cousin's missive, a quiet, cunning smile wrinkled his lip; but he seemed to ponder somewhat gravely after he laid it down, and paused more than once while inditing this reply:

"MY DEAR MARIAN,—You know you may always command my resources, such as they are; and if one can not speak freely to one's cousin, there is an end of confidences; nevertheless I doubt—rather more than doubt—whether I am justified in answering your questions. Their object, of course, is very plain; for Miss Shafton's engagement was discussed last night at several tobacco-parliaments, I fancy, besides the one at which I assisted.

"There will be slaying of oxen and broaching of barrels and lighting of deal-fires, I suppose, when that same bride is brought home to Templestowe; but I do not suppose that her reception within doors will be absolutely enthusiastic. But then again, to find a house—castle, cot, mansion, or villa—where a step-mother—particularly a young step-mother, and handsome *par-dessus le marché*—might count on being honestly welcome, you would have to travel far, perhaps as far as the Undiscovered Islands, if any such remain. Now, in my humble judgment, when a bitter draught is inevitable, it is infinitely more sensible to open your mouth and shut your eyes and swallow it, like Margery Goodchild, than to submit the potion to all possible tests of taste, sight, and smell. You will see the application of this elegant allegory at once; but that it should for one moment influence you, would be far too much to expect. So having tried to satisfy my own conscience, I will try and satisfy your curiosity—always under protest.

"We will take the lady's family first. In point of descent it would puzzle the herald's office to peck a hole in the coat of the Shaftons of Blytheswold; but in a social point of view their garments for some generations past have needed much mending. It is of the males I speak, remember; for concerning the females history is comparatively silent. Ill-natured people have said that by the side of such *diabes déchainés* as their husbands and brothers, the womankind must needs have seemed quasi-angelical; for myself I prefer to believe that there was no evil to be told, rather than that it was smothered in comparison. At any rate against Miss Shafton's next ancestress—this is our diplomatic way of putting *mother*—there is not a word to be said. She has had very difficult cards to play with her late husband, and with one at least of her two children, and has played them, I have always heard, with great patience, honesty, and skill. The child I refer to is a prodigal, a very prodigal son, presently a lieutenant in the — hussars, who, if there is any left, is wasting his substance in the good old family fashion rather more rapidly than his sire and grandsire did before him—no small word.

"Next as to the *physique*. I should have guessed you would be curious on this point, even if you had not put it beyond a doubt by blinking that question altogether. Well, if the figure is not perfect on an imperial scale, I, speaking as a humble amateur, do not quite know where it is to be matched. In the face there are half a dozen faults, I dare say; but she has taken beauty-rank ever since I can remember her; and it is too late—or too soon—now to try to disqualify her.

"As to the *morale*—"

Karneguy came fairly to a check here, and, walking to the window, looked out over the Mall, seeking perhaps, as cleverer men have done before him, to gather inspiration from the thin brown trees seething and swaying in the sullen wind. He came back after a while, and wrote on again, but more slowly than before:

"As to the *morale*. We are on much more delicate and difficult ground here; and pray remember the few hints that I can furnish are founded entirely on

hearsay and guess-work, not on any personal knowledge of the subject. If my poor skill in physiognomy does not mislead me, I think I may fairly attribute to the lady a certain strength of will and passion, and a temper less violent than intractable. I can conceive her willful or reckless to any degree, but scarcely, under any provocation, cowardly, malicious, or mean. On the whole, very nearly a grand character, but of the kind which is wrecked much oftener than more ignoble ones. Now do not stretch or distort my meaning. I do not pretend to insinuate that she has come to any serious grief as yet; but that she was much talked about at one time I can not deny. This is no more than any handsome woman who lives up to the pace of the period ought to expect; but Miss Shafton had exceptionally bad luck in the name which was coupled with hers. You were very little in town before your marriage, and these matters belong to the Pre-Marianide Era; nevertheless, you must have heard more than once of Caryl Glynne. Perhaps the man is not a whit worse than many of his fellows; but he has an unlucky *spécialité* for compromising his female acquaintance. An 'acquaintance' is rather a mild way of putting the intimacy of these two while it lasted. I never heard any thing worse than imprudences alleged against her, such as open-air meetings held at uncanonical hours in the forenoon, and the like; but people made as much fuss about it as if the whole decalogue had been broken. I dare say Glynne would willingly have married her; but as his marrying any one but an heiress was and is a notorious impossibility, his good intentions did not count for much in extenuation. To do the mother justice, when the rumors flying abroad came to her ears she acted promptly and decisively; and if the meshes entangling the fair Lena were not broken then and there, it was no fault of hers. That they were so broken I am inclined to believe; indeed, I should feel absolutely confident of it if I had not remarked a certain change in Glynne's manner of life that makes me think that up till now, at all events, he must have had some hope or object of which the world was not aware. He is still very far from sanctity, no doubt; but since then he has certainly contrived to steer clear of any open scandals. Don't you admire the charity that can not confess improvement in one's neighbor without imputing to him covert, if not evil motives? At any rate, of late years the Shaftons have lived so very quietly and blamelessly that society may well afford to bury the hatchet; and if I can not congratulate you on your connection, I will not allow that you are greatly to be condoled with.

"So I have answered your queries with thoroughly unprofessional candor; and though I am sure that you will make no ill use of my weakness, I look at what I have written not without self-reproach and misgiving. Doubtless you would have heard of these *cancans* sooner or later, and, perhaps, in a more garbled fashion than I have set them down; nevertheless, it might have been better if I had chanced this.

"My acquaintance with the future Lady Atherstone is very slight; so you may believe it is not in her interest that I close this long letter with a short scrap of advice, which you may leave unread if you will. Does not the text run thus, 'Agree with thine adversary quickly, while thou art in the way with him?' My dear Marian, it was not to men only that these words were spoken; and there is more of wisdom in them—ay! even of worldly wisdom—than in most saws or proverbs. I pray you now, if ever, to lay them to heart; I feel certain that it will be easy for you soon to gain a fast friend and useful ally; also, it may not be hard to make a very dangerous enemy. Either way, may good wishes follow you! but in the latter case, with all possible respect for your science and courage, I fear that some day you will have to call a truce, and that, if granted, it will be not on your own terms.

"I hope that the next service you require at my hands will be less distasteful to me than that which I have just performed, though I do not begrudge you even this. Always affectionately yours,

"A."

It was characteristic, both of the writer and of the person to whom this document was addressed, that it never alluded to the possibility of Philip's sharing in its confidences. In truth, you would have thought such a caution thoroughly needless if you had watched Marian Ashleigh during the perusal. She did not attempt to open the Foreign Office dispatch when it came with the other letters; but locked it away in a casket, and there let it lie till her husband had departed to the Petty Sessions at Heslingford. Then she shut herself up in her boudoir with the precious packet; and while she studied it to the last syllable, and weighed the last grain of its meaning, the great bell overhead might have rung out alarms and she would never have stirred. After a while—a long while—she dropped the letter, envelope and all, into the heart of the fierce fire that burned close to her feet. Her eyes followed the light gray flakes as they vanished up the chimney with a kind of regret; and yet a more useless document than that just annihilated can hardly be conceived; for every line by this time was rewritten in characters more abiding than pen ever traced on paper; and before Marian Ashleigh will forget the lightest syllable therein she will forget the prayers they taught her when she was a little child.

CHAPTER XII.

ONE forenoon some twenty centuries ago Cambyzes, son of Cyrus, sitting in his summer-garden under the shadow of the planes, overheard one of his courtiers extolling the wondrous prowess of a certain Bactrian bowman. Now the king himself was a matchless archer, and his heart, as he listened, grew hot with envy. After a while, lifting up his head, he pointed to a single tree that stood afar off in the green-sward. "Thou seest yonder palm, Prexaspes," quoth he; "thinkest thou that this Bactrian of thine could aim at such distance at a hand's-breadth and not miss?" And Prexaspes made answer, "Nay, my lord, for I spake only of feats that may be compassed by mortal skill; and such a one is not of these." Said the king, "And if I myself were to make essay, thinkest thou that I should likewise fail?" Prexaspes answered, "My lord, I needs must think so; especially as yester even thou didst tarry somewhat long with the beakers." The great black eyes that, even when wrath or drink or lust inflamed them not, gleamed ever savagely, roved round the circle till they lighted on a boy beautiful above his page-fellows—the first-born of Prexaspes. Then said Cambyzes, "Go bind my cup-bearer fast to yonder palm so that he stir not a finger; and fetch hither the Macrobian bow." It was the self-same weapon that the spies had brought back from Ethiopia, with the challenge to any Persian to bend it; and, in truth, to that task none had been found equal save only the great king. He

strained it now till the horns nearly met; and as he drew the long arrow to the head, he glanced askance at the satrap, saying, "I aim at the heart." Then came a sharp twang, a shrill whistle, and the dull echo of a bolt smiting its mark; and those who were keenest of sight saw the fair child fall forward over his bonds, with all his limbs a-quivering. "Go now, Prexaspes," quoth the king, "and mark how my shaft hath sped." The father did as he was bidden. When he returned his face was white and riven, as the face of a slain man; but as he made obeisance he smiled meekly and piteously. "What am I," he said, "that I should have questioned my lord's strength and skill? His arrows are like the arrows of the god Horas, whom these Egyptians adore. The child's heart must needs be cloven in twain." And the great king laughed loud as he made answer, "Thou art forgiven, Prexaspes; only, when the Persians call Cambyzes drunkard, forget not to tell to what purpose, on the morning after a revel, he bent the Macrobian bow."

A courtly satrap—was it not? Nevertheless, courtiership was in its infancy then; nowadays, when a skillful archer has stricken down the hope or the object nearest and dearest to our heart, we do not even change color while we acknowledge his prowess; and if we do not always bid the bugle strike up in his honor, we can generally manage a grimace of congratulation.

Marian Ashleigh was no special dissembler; but you may guess that during the next two days she prepared herself to play her part decorously. It was much more trouble to tutor her husband: characters like his, from their very weakness and instability, are difficult to deal with. I remember a drill-sergeant saying years ago—"I don't care how rough the stuff is, so long as there's enough of it," and the sentiment appears no less morally than physically just. There was no fear of Philip's kicking over the traces, or giving any overt signs of rebellion; but as to keeping him up to the collar, and making him do his work pleasantly—that was quite another affair. However, by dint of much coaxing, a little urging, and perhaps just a shade of intimidation, his wife got him pretty well into her hand at last; and when Lord Atherstone arrived, he could scarcely have complained of his reception, even if he had been disposed to be captious. Marian's first embrace was more than sufficiently cordial, and so was her first speech, though it was low and brief.

"I do hope you will be happy."

Philip's remarks "were quite inaudible in the gallery;" but "he was understood to second the address."

Perhaps Lord Atherstone did not expect more; at any rate, his countenance showed that he was perfectly content; and not only throughout that evening, but for some days afterward, his manner toward both the Ashleighs was unusually gentle and kindly. Though he spoke very little about future arrangements,

he contrived to make them both thoroughly understand that he neither contemplated nor desired their immediate removal from Templestowe. So things went on smoothly enough throughout the following week; the baron hunted his five days as usual, bruising along just as determinedly as before he incurred fresh responsibilities. He accepted the congratulations and surprise of his friends and acquaintance—for by this time the engagement was fully noised abroad—with a wonderful composure, as if both were matters of course, and had for all nearly the same formula of acknowledgment.

On the ensuing Sunday it chanced that he breakfasted alone with his daughter-in-law; for Philip either was, or affected to be, too unwell to put in an appearance. You have not forgotten, perhaps, the peculiarity of the Sabbath post. When the letters were brought in, there was certainly something very odd in Marian Ashleigh's expression. It was like—yet not altogether like—that which her face had worn on the morning when she first began to doubt the stability of her tenure of Templestowe. Once more she watched Lord Atherstone, covertly but narrowly, as he took up his letters; but, besides vigilance, you might have detected a certain expectation in her eyes, not altogether devoid of dread; you might fancy just such a look on the countenance of a conspirator who, having lighted the slow match, lurks in a nook almost too close for safety to mark the effect of the train.

No need to ask from whom the first letter Lord Atherstone opened came; the smile—almost genial, for a wonder—hovering under his heavy gray mustache as he read, answered that question. The two or three that followed were evidently of no moment; but as he took up the last, Marian, who all this time, while apparently deep in her own correspondence, had never once relaxed her watch, could not repress a slight, a very slight, start, and she drew back yet further behind the cover of the great silver urn.

Lord Atherstone's glance was exceptionally swift and keen; nevertheless, he could not possibly have read half down the first page when he crushed the letter into a ball and flung it on the floor; and on his face there was less of anger than contemptuous loathing. Marian Ashleigh's countenance fell, and she bit her nether lip sharply. She had never studied Greek; yet perhaps the same thoughts crossed her mind just then as were in Teucer's mind when he muttered:

Ὀπόποι, ἡ δὴ παγχυ μάχης ἐπὶ μῆδεα κείρει
Δαίμων ἡμετέρης, ὃ τέ μοι βίον ἐκβαλε χείρος,
Νευρὴν δ' ἐξέρρηξε νεόστροφον, ἣν ἐνέδησα
Πρώιον, ὅφρ' ἀνέχοιτο θαμὰ θρύσκοντας ὕστους.

After a minute or two Lord Atherstone broke silence:

"Marian, did it ever happen to you to receive an anonymous letter?"

She started, quite palpably now; but being disturbed in her correspondence might well account for this; and her voice was perfectly

steady, though a very delicate ear might perhaps have detected in it some slight constraint.

"Never any thing worse than a valentine. I was rather fond of them when I was a girl; but when I became a matron I put away such vanities. You don't mean to say that you have been so favored this morning? Is it indiscreet to ask its purport?"

"I don't know it myself," he replied. "The first two lines avowed the letter to be anonymous; in the third was Lena Shafton's name. After that I would no more have read further, unless she bade me, than I would have gone on drinking poison after fair warning. Perhaps it ought not to be burned without her leave. What do you think? No man is a fit judge in such a case—I less than most men. You are a woman, wise and kind, as well as good. Think how you would have liked Philip to act, and answer me honestly."

She seemed to ponder deeply, and during that pause she was once perhaps moved to say, "Burn it instantly, and so let it pass away;" but that weakness endured scarcely for a second's space; and when she answered, it was with a purpose set and planned.

"I think if Philip had received such a letter as this seems likely to turn out, and had kept it a secret from me, I should have found it hard to forgive him—harder still to trust him thoroughly any more. However hateful it may be to you, you are bound to show it to Miss Shafton, and let her dispose of it at her pleasure. I am not as wise as you give me credit for; but I do believe I advise now what is best for you both."

"I suppose you are right," he said, discontentedly; and so picked up the letter; but he scarcely looked at it as he smoothed out the creases before replacing it in its envelope, and his face expressed the aversion of one who, for reasons good, forces himself to handle tenderly some noisome reptile that he would fain have trampled under heel. That his appetite was spoiled was very evident; for after one or two fruitless attempts to settle down again to his meal, he arose and began to pace to and fro, coming to a halt at last just behind Marian's chair; he paused there a little, as if considering, and then leaning forward, laid his hand on her shoulder softly.

"My dear," he said, "I so hope you will try and be kind to Lena."

There was something strangely pathetic, not only in the earnestness, but in the humility of that intercession, coming as it did from one who, perhaps, never in his life had craved favor or indulgence from any fellow-creature; and many men thus tested, if not absolutely moved to compunction, would have been so far embarrassed as to blunder or stumble in their reply; but in these delicate touches of the trail the feminine superiority is manifest. In falsehood, cruelty, or cunning, we are perhaps more than their match; but in doing their cozening gently, they teach us lessons that we shall

never learn. When a man is weaving a net to catch his neighbor's soul, if he looks not guilty or shame-stricken, he will at the best brazen it out in Mephistopheles's vein; but take a woman under the same circumstances, and by Saint Iago, she might be Gretchen at her spinning-wheel; and—mark you—even while she looks up innocently into your face, her lithesome fingers cease not to ply the shuttle.

There was nothing fiendish about Marian Ashleigh. Her Christianity perhaps went beyond formalism, and her morality was something more than surface-deep; but neither restrained her from using all lawful means toward a given end, or from interpreting "lawfulness" somewhat liberally. Howsoever she might choose to gloss the matter to her husband, she did in her heart consider that Lord Atherstone's present purpose was a manifest injustice, if not injury, to his family, and therefore to be thwarted, if that were possible, by all stratagem not absolutely sinful or shameful. She was not free to admit that either of these epithets could justly attach to the laying of an information which might possibly be true, or to the promise that she would essay a manifest impossibility. When she answered her father-in-law's appeal with a confidential smile and a whisper—"Can you doubt me?"—she knew it was more likely that oil would mingle with the running stream than that kindness would ever subsist between herself and Lena Shafton; nevertheless, of course she might "try." So, if my sweet cousin Alice, now in her fifth summer, were to set her affections on some bright particular star, I might promise to do my very best to fetch it down from its place in the firmament; but whether I should be justified in thus temporizing with this imperious young person, subtler casuists may decide. If all her *dévôtes* were to make full and free confession, I fancy such a question would not unfrequently be set before their conscience-keepers.

You have probably already attributed to the right source the authorship of the anonymous note. It was indeed Marian, and no other, that indited it and caused it to be posted in town by a sure hand. She ran a very slight risk here, for she could thoroughly trust her agent, and it was the only one she incurred. The handwriting was so cunningly distorted as almost to defy detection: besides this, she knew Lord Atherstone well enough to be certain that he would never allow any other eye than Lena's and his own to rest on those characters. Still she did think that he would have read the letter through, even if he had chosen to discredit every syllable of its contents; and her first feeling was one of sharp disappointment. Nevertheless, that it would be shown to Lena was a great point gained: then, at least, Lord Atherstone must be made acquainted with the contents; and if he should decline to credit or discuss them, the seed would still be sown, and sooner or later might fructify. Altogether it was not such a very bad morning's work.

An hour later Marian Ashleigh, kneeling in her place, besought of Heaven "to forgive her enemies, persecutors, and slanderers, and to turn their hearts;" and while she murmured this petition, stretching forth her hand she might have touched the man against whose peace she had already begun to contrive—a man who, however harshly and sternly he may have borne himself toward others, had ever kept a kindly word and look and thought for her, and whose bread she had eaten ever since she came forth from her father's home.

Once more, I see nothing monstrous in all this: there are vices and basenesses peculiar to either sex, of which the other is seldom guilty, simply from lack of temptation thereto. On the point of anonymous letter writing woman-kind seem to be affected with some strange cecity or obliquity of moral vision. For if the experts are to be trusted, we needs must believe that nine-tenths of darkling stabs are dealt either by female or by androgynic hands, and that of these more than a fair proportion may be traced to persons esteemed good by themselves not less than by the world—who hold their heads high in oratory as well as in church, and who perchance are in all other points of the law blameless. If by a rare chance such criminals be caught in the fact, do not expect to find them specially contrite or humble: they will probably bridle up, brace their lips, and say that they have done what they deemed to be their duty, and are content to be misunderstood; but, my brethren, for our comfort, let us believe something more: that our pious benefactresses may be brought to account concerning these matters yet once again; and that in such a Day it will be less tolerable for them than for some who, when their guilt was revealed, groveled before the accuser in a very agony of abasement.

THE GAMING-TABLE.

"It is possible that a wise and good man may be prevailed on to game; but it is impossible that a professed gamester should be a wise and good man."—LAVATER.

THERE appeared many years ago in a quaint old English publication an allegory giving the imaginary origin of gaming. It is said that the goddess of fortune, once sporting near the shady pool of Olympus, was met by the gay and captivating god of war, who soon allured her to his arms. They were united; but the matrimony was not holy, and the result of the union was a misfeatured child called Gaming. From the moment of her birth this wayward thing could only be pleased by cards, dice, or counters. She was not without fascinations, and many were her admirers. As she grew up she was courted by all the gay and extravagant of both sexes; for she was of neither sex, and yet combining the attractions of each. At length, however, being mostly beset by men of the sword, she formed an unnatural union with one

of them, and gave birth to twins—one called Dueling, the other Suicide. These became their mother's darlings, nursed by her with constant care and tenderness, and her perpetual companions. The goddess Fortune ever had an eye on her promising daughter, Gaming; and endowed her with splendid residences in the most conspicuous streets, near the palaces of kings. They were magnificently designed and elegantly furnished. Lamps always burning at the portals were a sign and a perpetual invitation unto all to enter; and, like the gates of the Inferno, they were ever open to daily and nightly visitants; but, unlike the latter, they permitted *exit* to all who entered—some exulting with golden spoil, others with their hands in empty pockets; some led by her half-witted son Dueling, others escorted by her malignant monster Suicide, and his mate, the demon Despair.

"Religion, morals, virtue, all give way,
And conscience dies, the prostitute of play.
Eternity ne'er steals one thought between,
Till suicide completes the fatal scene."

Such is the allegory.

From the day that Esau "went short" on "birthright," Jacob having "cornered" him, and called in all the "pottage" there was on the market, the passion of gaming has prevailed in all nations, with the single exception of the Mohammedans, whose religion prevents it. The determination of events by "lot" was a practice frequently resorted to by the Israelites; as, by lot it was determined which of the goats should be offered by Aaron; by lot the land of Canaan was divided; by lot Saul was marked out for the Hebrew kingdom; by lot Jonah was discovered to be the cause of the storm.

Plutarch tells a pretty Egyptian story, that Mercury, having fallen in love with Rhea, or the Earth, and wishing to do her a favor, gambled with the Moon, and won from her every seventieth part of the time she illumined the horizon, all which parts he united together, making up *five days*, and added them to the Earth's year, which had previously consisted of only 360 days.

Cards, which are commonly supposed to have been invented for the amusement of Charles VI. of France, were really invented ages ago by the Chinese, who have always been eager gamblers; indeed, they play night and day, and frequently, having lost all they are worth, go—and hang themselves.

Going northward to the regions of ice, we find the Greenlanders gambling with a board, which has a finger-piece in it turning round on an axle, and the person to whom the finger points on the stopping of the board, which is whirled round, "sweeps" all the "stakes."

The old Romans—those grand old fellows—what gamblers they were! In their "lotteries" were often prizes of great value, as a good estate and slaves, or rich vases; others of little value, as vases of common earth.

The Spaniards, as a people, are said to be

more addicted to gaming than any other nation. A traveler says: "I have wandered through all parts of Spain, and though in many places I have scarcely been able to procure a glass of wine, or a bit of bread, or any of the first conveniences of life, yet I never went through a village so mean and out of the way in which I could not have purchased a pack of cards." Voltaire, however, says the Spaniards were formerly very generous in their gaming. "The grandees had a generous ostentation; this was to divide the money won at play among all the by-standers, of whatever condition."

In England gambling prevailed during the reign of Henry VIII.; the king being himself a gamester of the most unscrupulous sort; and the practice was equally fashionable during the reigns of Elizabeth, James I., and especially in the times of Charles II. Writing on the day when James II. was proclaimed king, Evelyn says: "I can never forget the inexpressible luxury and profaneness, gaming and all dissoluteness, and, as it were, total forgetfulness of God (it being Sunday evening), which this day se'night I was witness of: the king sitting and toying with his concubines, Portsmouth, Cleveland, and Mazarine, etc., a French boy singing love-songs in that glorious gallery, whilst about twenty of the great courtiers and other dissolute persons were at basset round a large table, a bank of at least £2000 in gold before them, upon which two gentlemen who were with me made reflections of astonishment. Six days after, all was in the dust."

The *Harleian Miscellany*, of 1668, has the following curious allusion to the gaming of that day: "Betwixt twelve and one o'clock a good dinner is prepared by way of ordinary, and some gentlemen of civility and condition oftentimes eat there, and play a while for recreation after dinner, both moderately and most commonly without deserving reproof. Towards night, when ravenous beasts usually seek their prey, there come in shoals of hectors, trepanners, gilts, pads, biters, prigs, divers, lifters, mill kens, piemen, decoys, shop-lifters, foilers, bulkers, droppers, gamblers, donnakers, cross-biters, etc. (a goodly vocabulary!), under the general appellation of 'rooks;' and in this particular it serves as a nursery for Tyburn, for every year some of this gang march thither."

One of the largest gambling transactions on record is the Hindoo match between Duryodhana and Yudhishthira. Whatever the latter staked was met by the former; but Yudhishthira lost every game; first a very beautiful pearl; next, 1000 bags each containing 1000 pieces of gold; next, a piece of gold so pure that it was soft as wax; next, a chariot set with jewels and hung all round with golden bells; next, 1000 war-elephants with golden howdahs set with diamonds; next, a lack (100,000) of slaves, all dressed in good garments; next, a lack of beautiful slave girls, adorned from head to foot with golden ornaments; next, all the remainder of his goods;

next, all his cattle; and then the whole of his Raj, or kingdom, excepting only the lands which had been granted to the Brahmins. This was done with dice. The uniformity with which our friend Yudhishtira lost suggests to the Yankee mind that it was not a "square game." As they phrase it "on the Mississip"—"them dice was loaded."

Speaking of dice, it is known that that species of diversion was usual and fashionable at the Persian court in the times of the younger Cyrus (about 400 years before the Christian era).

Among the ancient Roman emperors gaming was fashionable. Augustus was greatly addicted to, and even gloried in, it. The Cæsars indulged in it. At the gaming-table Caligula stooped even to falsehood and perjury. On one occasion, after having condemned to death several Gauls of great opulence, he immediately went back to his gambling companions and said: "I pity you when I see you lose a few sesterii, while, with a stroke of the pen, I have just won six hundred millions." (Thirty millions of pounds sterling.) The Emperor Claudius played like an imbecile; Nero like a madman. The latter would stake four hundred thousand sesterii (£20,000) on a single throw of the dice. Claudius played at dice on his journeys, having the interior of his carriage so arranged as to prevent the motion from interfering with the game. Seneca, in his play on the death of Claudius, represents him as in the lower regions condemned to pick up dice forever, putting them into a box without a bottom. Caligula was reproached for having played at dice on the day of his sister's funeral. Domitian gamed from morning to night, without excepting the festivals of the Roman calendar. The day on which Didius Julianus was proclaimed emperor, he walked over the dead and bloody body of Pertinax, and began to play at dice in the next room. Finally, at the epoch when Constantine abandoned Rome never to return, every inhabitant of that city, down to the populace, was addicted to gambling.

In France, during the reign of Henry IV., gambling became the rage. Many distinguished families were utterly ruined by it. The Duc De Biron lost, in a single year, more than 500,000 crowns (about £125,000). "My son Constant," says D'Aubigné, "lost twenty times more than he was worth; so that, finding himself without resources, he abjured his religion." It was at the court of this king that was invented the method of speedy ruin by means of written vouchers for loss, which simplified the thing in all subsequent times. One can scarcely form an idea of the extent of gaming at this period. Bassompierre declares, in his Memoirs, that he won more than 500,000 livres (£25,000) in one year, and his friend Pimentello won more than 200,000 crowns (£50,000). Late in life Bassompierre won £50,000 at a single sitting, from M. De Guise, Joinville, and the Maréchal D'Ancre. But, like most gamblers, he died so poor that he did not

leave enough to pay the twentieth part of his debts.

Henry IV. was finally cured of gambling. Having lost an immense sum at play, he asked his minister, the great Duke of Sully, for the money. The latter demurred, so that the king had to send to him several times. Finally Sully took him the money, and spread it out before him on the table, exclaiming, "There is the sum!" Henry fixed his eyes on the vast amount. It is said to have been enough to purchase Amiens from the Spaniards, who then held it. The king thereupon exclaimed: "I am corrected! I will never again lose my money at gaming!"

Fouché, the minister of police, derived an income of £128,000 a year for licensing, or "privileging," gaming-houses, to which cards of address were regularly furnished. Besides this, the keepers of the houses were compelled to hire and pay 120,000 persons employed in those houses as *croupiers* or attendants at the gaming-table from half a crown to half a guinea a day; and all these 120,000 persons were *spies of Fouché*!

There were no gamestresses among the Greeks; and the Roman women were always too much occupied with their domestic affairs to find time for play. What will our modern ladies think when we state that the Emperor Augustus scarcely wore a garment which had not been woven by his wife, his sister, or grand-daughters! ("Veste non temerè aliâ quàm domesticâ usus est, ab uxore et filiâ nepotibusque confectâ." Suet. in *Vitæ Cesarum*.)

In France, women who wished to gamble were, at first, obliged to keep the thing secret; for if it became known they lost caste. In the reigns of Louis XIV. and Louis XV. they became bolder, and the wives of the great engaged in the deepest play in their mansions; but still a gamestress was always denounced with horror. "Such women," says La Bruyère, "make us chaste; they have nothing of the sex but its garments." Then, as now, the vice led to other crimes. The Countess of Schwiechelt, a young and beautiful lady from Hanover, was much given to gambling, and lost 50,000 livres at Paris. In order to repair this great loss, she planned and executed the robbery of a fine coronet of emeralds, the property of Madame Demidoff. She had made herself acquainted with the place where it was kept, and at a ball given by its owner, the Hanoverian lady contrived to purloin it. Her youth and rank in life induced many persons to solicit her pardon; but Bonaparte left her to the punishment to which she was condemned. This occurred in 1804.

Of English gamestresses Goldsmith mentions an old lady in the country who, having been given over by her physician, played with the curate of the parish to pass the time away. Having won all his money, she next proposed playing for the funeral charges to which she would be liable. Unfortunately, the lady expired just as she had taken up the game!

A lady who was desperately fond of play was confessing herself. The priest represented, among other arguments against gaming, the great loss of time it occasioned. "Ah!" said the lady, "that is what vexes me—*so much time lost in shuffling the cards!*"

A curious case is reported in the London papers of 1820 of James Lloyd, who practiced on the credulity of the lower orders by keeping a *Little Go*, or illegal lottery. He was brought up for the twentieth time to answer for that offense. This man was a Methodist preacher, and assembled his neighbors together at his dwelling on a Saturday to preach the Gospel to them, and the remainder of the week he was to be found, with an equally numerous party, instructing them in the ruinous vices of gambling. The charge was clearly proved, and the prisoner was sentenced to three months' imprisonment with hard labor.

The celebrated Mrs. Crewe, whose husband was in 1806 made Lord Crewe, was as remarkable for her accomplishments and her worth as for her beauty; nevertheless, she, like most of the grand ladies of the time, was a gamestress, and permitted the admiration of the profligate Charles James Fox, who wrote on her the following lines, which were said to be not exaggerated:

"Where the loveliest expression to features is join'd,
By Nature's most delicate pencil design'd;
Where blushes unhidden, and smiles without art,
Speak the softness and feeling that dwell in the heart;
Where in manners enchanting no blemish we trace,
But the soul keeps the promise we had from the face;
Sure philosophy, reason, and coldness must prove
Defenses unequal to shield us from love."

Nearly eight years after the famous election at Westminster, when she personally canvassed for Fox, Mrs. Crewe was still in perfection, with a son one-and-twenty, who looked like her brother. The form of her face was exquisitely lovely, her complexion radiant. "I know not," Miss Burney writes, "any female in her first youth who could bear the comparison. She *uglifies* every one near her."

During the last half of the last century many titled ladies not only gambled, but kept gaming-houses. One of these actually appealed to the House of Lords for protection against the intrusion of officers into her establishment on the plea of her peerage! The following record of it is in the Journal of the House of Lords:

"*Die Lunæ, 29o Aprilis, 1745.* — GAMING. — A bill for preventing the excessive and deceitful use of it having been brought from the Commons, information was given to the House that Mr. Burdus, Chairman of the Quarter Sessions for the city and liberty of Westminster, was at the door. He was called in, and gave an account that the claims of privilege of peerage were made and insisted on by the Ladies Mordington and Casselis, in order to intimidate the peace officers from doing their duty in suppressing the public gaming-houses kept by the said ladies. And the said Burdus thereupon delivered in an instrument in writing of said

Lady Mordington, containing the claim she made of privilege for her officers and servants employed by her in her said gaming-house, as follows: I, Dame Mary, Baroness of Mordington, do hold a house in the Great Piazza, Covent Garden, for and as an Assembly, where all persons of credit are at liberty to frequent and play at such diversions as are used at other Assemblies. And I have hired Joseph Dewberry, Wm. Horsley, Ham Cropper, and Geo. Sanders, as my servants or managers (under me) thereof. I have given them orders to direct the management of the other inferior servants, (namely) John Bright (!), John Hill, John Vandenvoren, as box-keepers, Gilbert Richardson, housekeeper, John Chaplain, regulator, Wm. Stanley and Henry Huggins, servants that wait on the company at the said Assembly, Wm. Penny and Jos. Penny, as porters thereof. And all the above-mentioned persons I claim as my domestick servants, and demand all those privileges that belong to me as a peeress of Great Britain appertaining to my said Assembly. M. MORDINGTON. Dated 8th Jan., 1774." But the House declared against her.

Proceedings were also taken against the famous Lady Buckinghamshire, a notorious gamestress, who, at the close of the last century, actually slept with a blunderbuss and a pair of pistols at her side to protect her faro-bank. On the 11th March, 1797, her ladyship, together with Lady E. Lutterell and a Mrs. Sturt, were convicted at the police court and fined £50 for playing at faro; and Henry Martindale was convicted and fined £200 for keeping the faro-table at Lady Buckinghamshire's. This fellow soon afterward "burst up," and went into bankruptcy owing £328,000, besides "debts of honor" amounting to £150,000. Going "up" for an odd \$2,500,000 far surpasses any "black-leg" failure that has yet occurred in this republican country. His assets yielded about seven cents on the dollar.

Beau Nash was in his palmy day a noted player, but in his last years abandoned it. When the Earl of T—— was a youth he was passionately fond of play. Nash undertook to cure him. Conscious of his superior skill, he engaged the Earl in single play. His lordship lost his estate, equipage, every thing! The generous Nash returned all, only stipulating for the payment of £5000 whenever he might think proper to demand it. Some time after his lordship's death, Nash's affairs being on the wane, he demanded it of his heirs, who paid it without hesitation.

The corporation of Bath so highly respected Nash that the Chamber voted a marble statue of him, which was erected in the Pump Room, between the busts of Newton and Pope. This caused Lord Chesterfield's stinging epigram concluding with these lines:

"The statue placed these busts between
Gives satire all its strength;
Wisdom and Wit are little seen,
But Folly at full length."

George Selwyn, one of the remarkable Englishmen of a hundred years ago, marred an otherwise exceedingly fine character by his passion for gaming. He had another peculiar characteristic—a morbid interest in the details of human suffering, and a taste for witnessing criminal executions. When the first Lord Holland was on his death-bed he was told that Selwyn, who had lived on terms of the closest intimacy with him, had called to inquire after his health: "The next time Mr. Selwyn calls," said he, "show him up; if I am alive, I shall be delighted to see him; if I am dead, he will be glad to see me." When some ladies bantered him on his want of feeling in attending to see the terrible Lord Lovat's head cut off—"Why," he said, "I made amends by going to the undertaker's to see it sewed on again." And yet this was the same man who delighted in the first words and in the sunny looks of childhood; whose friendship seems to have partaken of all the softness of female affection; and whose heart was never hardened against the wretched and oppressed.

The following are some of Selwyn's jokes relating to gambling:

One night, at White's, observing the Postmaster-General, Sir Everard Fawkener, losing a large sum at piquet, Selwyn, pointing to the successful player, remarked, "See, now, he is robbing the *mail*!"

On another occasion, in 1776, observing Mr. Ponsonby, the Speaker of the Irish House of Commons, tossing about bank-bills at a hazard-table at Newmarket—"Look!" he said; "how easily the Speaker passes the money bills!"

On one of the waiters, at Arthur's Club, having been committed to prison for a felony—"What a horrid idea," said Selwyn, "he will give of us to the people in Newgate!"

When the affairs of Charles Fox were in a more than usually embarrassed state, chiefly through his gambling, his friends raised a subscription among themselves for his relief. One of them remarking that it would require some delicacy in breaking the matter to him, and adding that, "he wondered how Fox would take it?" "Take it?" interrupted Selwyn; "why, *quarterly*, to be sure!"

Gibbon writes to Lord Sheffield in 1773—"You know Lord Holland is paying Charles Fox's debts. They amount to £140,000." This was mostly the result of gambling, and principally by losses at faro. Before he attained his thirtieth year he had completely dissipated every thing that he could either command or could procure by the most ruinous expedients. He had even undergone many of the severest privations incidental to the vicissitudes that attend a gamester's progress; frequently wanting money to defray the common daily wants of the most pressing nature. Of the Jews he borrowed great sums at exorbitant premiums.

His brother Stephen was enormously fat; George Selwyn said *he* was in the right to deal with Shylocks, as he could give them pounds

of flesh! On the death of Lord Holland he left Charles £154,000 to pay his debts; it was all "bespoke," and Fox soon became as deeply pledged as before.

Amidst the wildest excesses of youth, even while the perpetual victim of his passion for play, Fox eagerly cultivated his taste for letters, especially the Greek and Roman historians and poets, and he found resources in their works under the most severe depressions occasioned by losses. One morning, after he had passed the whole night in company with Topham Beauclerk at faro, the two friends were about to separate. Fox had lost through the night, and was in a frame of mind approaching to desperation. Beauclerk's anxiety for the consequences which might ensue led him to be early at Fox's lodgings; and on arriving he inquired, not without apprehension, whether he had risen. The servant replied that Mr. Fox was in the drawing-room, when Beauclerk walked up stairs and cautiously opened the door, expecting to behold a frantic gamester stretched on the floor bewailing his losses; but he was astonished to find him reading a Greek Herodotus. On perceiving his friend's surprise Fox exclaimed, "What would you have me do? I have lost my last shilling."

Fox's best friends are said to have been half ruined in annuities given by them as securities for him to the Jews. £500,000 a year of such annuities of Fox and his "society" were advertised to be sold at one time. Walpole notes that in the debate on the Thirty-nine Articles (a religious debate!), February 6, 1772, Fox *did not shine*. No wonder! He had sat up playing at hazard, at Almack's, from Tuesday evening, the 4th, till five in the afternoon of Wednesday, the 5th. An hour before, he had recovered £12,000 that he had lost; and by dinner, which was at five o'clock, he had ended, losing £11,000! On Thursday he spoke in the above debate; went to dinner at past eleven at night; from thence to White's, where he drank till seven the next morning; thence to Almack's, where he won £6000; and between three and four in the afternoon he set out for Newmarket. His brother Stephen lost £11,000 two nights after, and Charles £10,000 more on the 13th; so that in three nights the two brothers—the eldest not *twenty-five* years of age—lost \$160,000! On one occasion Stephen Fox was dreadfully fleeced at a gaming-house at the West End. He entered it with £13,000, and left it without a farthing. Mr. Fox died at the age of fifty-seven. Probably no public man, of the highest intellectual, social, and political rank, either in England or in any other country, gamed so largely and desperately as Mr. Fox. This was the great defect in his character. In all other respects he was delightful. The pleasantry, perhaps, of no man of wit had so unlabored an appearance. It seemed rather to escape from his mind than to be produced by it. He had lived on the most intimate terms with all his contemporaries distinguished by

wit, politeness, philosophy, learning, or the talents of public life. In the course of thirty years he had known almost every man in Europe whose intercourse could strengthen, or enrich, or polish the mind. He was the most Demosthenean speaker since the days of Demosthenes. "I knew him," said Edmund Burke, "when he was nineteen; since which time he has risen, by slow degrees, to be the most brilliant and accomplished debater the world ever saw."

Both Wilberforce and Pitt were at one period of their lives gamblers. Pitt once lost £100 at the faro-table at Goosetree's; but soon after, perceiving the fascination of gaming, abandoned it forever.

Wilberforce's own case is thus recorded by his biographers, on the authority of his private journal: "We can have no play to-night," complained some of the party at the club, "for St. Andrew is not here to keep the bank." "Wilberforce," said Mr. Bankes, who never joined himself, "if you will keep it I will give you a guinea." The playful challenge was accepted; but as the game grew deep, he rose the winner of £600. Much of this was lost by those who were only heirs to fortunes, and therefore could not meet such a call without inconvenience. The pain he felt at their annoyance cured him of a taste which seemed but too likely to become predominant.

Sir Philip Francis, the supposed author of "Junius," was a gambler, and the convivial companion of Fox, who made him a Knight of the Bath. One evening Roger Wilbraham came up to the whist-table where Sir Philip, who for the first time wore the ribbon of the Order, was engaged in a rubber, and said, laying hold of the ribbon, "So this is the way they have rewarded you at last; a bit of red ribbon for your services; and that satisfies you, does it? Now, what do you think they will give me, Sir Philip?" The newly-made knight, who had twenty-five guineas depending on the rubber, and who was not very well pleased at the interruption, suddenly turned round, and, looking at him fiercely, exclaimed, "A halter, and be—" etc.

Captain Dennis O'Kelly was called the "Admirable Chrichton" of the turf. A bet for a large sum having once been proposed to him, the proposer asked O'Kelly where lay his *estates* to answer for the amount if he lost. "My *estates*!" cried O'Kelly. "Oh, if that's what you *mane*, I've a *map* of them here." And opening his pocket-book, exhibited bank-notes to *ten times* the sum in question, and ultimately added the *inquirer's* contribution to them.

Crockford's, which was opened in 1827, was the most famous of modern London gambling-houses. It was fashionable. Wellington, who was an original member, did not play, being in this respect unlike Blücher, who repeatedly lost every thing he had at play. Crockford was originally a fishmonger. In 1840 he retired, a *millionaire*, much as an Indian chief retires from a hunting country when there is not game

enough left for his tribe, and the club tottered to its fall.

Turf-gambling has long been one of the most conspicuous of English immoralities. Lord Foley, who died in 1793, is supposed to have lost \$1,000,000 on the turf.

The last grand sensation and explosion in the English sporting world was in 1867, when the late young Marquis of Hastings lost £100,000 on Hermit. When rapid decay and a premature death put an end to his sufferings, many felt that he had atoned for his errors and indiscretions, while all united in considering him another unfortunate victim added to the long list of those who have sacrificed their fortune, health, and honor to the gambling Moloch presiding over the turf of England.

Among the notable suicides that have resulted from gambling that of Lord Mountford is conspicuous. He had lost money; feared to be reduced to distress; asked for a government appointment; and determined to throw the die of life or death on the answer received from court. The answer was unfavorable. He consulted several persons, indirectly at first, afterward directly, on the easiest mode of finishing life; invited a dinner-party for the day after; supped at White's, and played whist till one o'clock of the New-Year's morning. Lord Robert Bertie drank to him "a happy New-Year;" he clapped his hand strangely to his eyes. In the morning he sent for a lawyer and three witnesses, executed his will, made them read it over twice, paragraph by paragraph, asked the lawyer if that will would stand good though a man should shoot himself. Being assured it would, he said: "Pray stay, while I step into the next room;" went into the next room and shot himself, placing the muzzle of the pistol so close to his head that the report was not heard.

In concluding these curious facts and anecdotes relating to gambling, it may not be inappropriate to quote a paragraph from a sermon of the good Bishop Latimer, preached in St. Edward's Church, Cambridge, on the Sunday before Christmas-day, 1527, in which discourse he may be said to have "dealt" out an exposition of the precepts of Christianity according to the terms of card-playing: "Now ye have heard what is meant by this 'first card,' and how you ought to 'play' with it. I purpose again to 'deal' unto you 'another card almost of the same suit,' for they be of so nigh affinity that one can not be 'played' without the other," etc. "It seems," says Fuller, "that he suited his sermon rather to the *time*—being about Christmas, when cards were much used—than to the text, which was the Baptist's question to our Lord: 'Who art thou?'—taking occasion to conform his discourse to the 'playing at cards,' making the 'heart triumph.'"

"The sharp, the black-leg, and the knowing one,
Livery or lace, the self-same circle run:
The same the passion, end and means the same—
Dick and his Lordship differ but in name."

Editor's Easy Chair.

THE Academy Exhibition opens with the flowers, but T. T. will not open upon it this year. Peace, perturbed spirits! Ye who have portraits and landscapes and works of *genre* hung upon the walls, for once the tomahawk will not gleam nor the war-whoop disturb your dreams. But a sound and generous criticism is what we all need, brethren of the pencil and the pallet, and it is what we all seldom receive. Squibs and gibes, and sneers and thrusts, and, on the other hand, a gush of extravagant and meaningless praise—all these we have in plenty. Isn't our criticism favoritism? And may we not find some proof of it in the fact that really severe criticism is almost always considered to be personally malicious? The reasoning in the case of pictures seems to be this: "Why should a man 'pitch in' so upon honest, hard-working painters, spoiling their market, and starving them, if he has no malevolence? Surely a kindly, generous man does not do so." And don't we see the same reasoning elsewhere? Would it be impossible to name journals—not many—which are usually mentioned as "too critical," which are declared to be always lying in wait for a victim, and treating every author or statesman or artist as if he were a mere target for a fusillade of smartness?

Now, brother artist, let us stand before your best picture in the Academy this year. Is it a portrait or a landscape? For really it is not easy at this distance to say. Can a spectator, can this Easy Chair, for instance, which T. T. and certain other judges who might be mentioned hold to be the mushiest of babblers upon such subjects—can it be "too critical?" It may be foolish and flippant and unjust. It may utter the loud whoop of war and hit every head that it can reach. Or it may declare every picture to be sufficient evidence that the great day of American art has dawned. But this is not criticism. Criticism implies knowledge of the principles and laws involved in any work, with an intelligent perception of the object and a spirit of justice. If you suppose these you must accept the consequences. Criticism of a work of art, for instance, knows nothing of the artist. You may have drunk his punch, you may have smoked his cigars, he may have been most generous to you—and if you are to speak of him personally you will probably speak accordingly. But if you are to speak of his book, of his statue, of his painting, of his building, of his design in any kind, you must see that and that only, or you are no critic, and what you say is not criticism.

Hard? Why, it is one of the hardest things in the world. There really is no duty in civilized society more difficult than that of the honest critic. And instead of helping him, we all make his path as thorny as we can. If he tries to tell the truth, we shout and sneer and insinuate, or go off in a storm of wrath. We are swift to declare that he is a grinning surgeon delighting in the exposure of disease; that he gloats over defects; that it is his business to find fault. If he sees a rose, we are ready to swear that he instantly searches for a worm hidden in it. If he takes a fruit, we are sure that he straightway feels

for the unsound part. If it is a woman, we expect him to tell us that she paints. If it is a man, that he pads. The critic, we declare, is a ghoul. He feasts upon death. Now, good brethren of all the arts, if it is not easy to climb a bare pole, and yet we insist that it shall be climbed, why do we grease it?

We all agree that we want sound, healthful criticism. Only yesterday at the Exhibition Giulio Romano said to the Easy Chair that he wished the honest truth could be told about the pictures. This morning the Easy Chair met Mr. Romano in a towering rage. "What now?" "What now! Why, here is an article upon the Academy in the daily *Mortar and Pestle*, and it says of my picture of 'Apollo and the Muses' that Mr. Romano is evidently a close imitator of Raphael, and had better learn to depend upon himself. And they call that criticism!" Mr. Giulio Romano thinks that it is not criticism, because it is very severe; and if he met young — (but it is not fair to reveal his name, who undoubtedly wrote the article) he would feel so savagely that he would go near to insult him. Indeed, it hath been openly alleged that upon one occasion T. T.'s nose, under similar circumstances, was in mortal peril. Had there been an assault upon that member there would have been a fight, for T. T., although a quiet man, is not a coward. Brethren, may the Easy Chair ask if we artists and authors are likely to develop a sound and healthful system of criticism if we pull the noses of the critics who don't praise us?

And let us remember that there are various ways of pulling noses. The thing may be done metaphorically as well as physically. The Easy Chair has seen a man in company with others as plainly kicked as if every body had raised his foot against him. And the ill feeling, the avoidance, the aspersion, the unconcealed contempt, which so often attend criticism, are a distinct pulling of the nose of the critic, although they give him no excusable occasion for literal slapping of faces. See how this spirit displays itself in literature!

Here, for instance, is the *Mortar and Pestle*. It is the serious wish of the conductor of that journal to judge every new book upon its merits. To do this, he engages the most competent person in any particular case that he can find in the country; and he sedulously conceals his name. That critic tries the book by its merits solely. If it be a mere repetition of existing books, however well meant or however prettily done, the critic states the important fact, namely, that it is superfluous; and he does not waste his space and the patience of sincere people by stating that it is a pretty superfluity. If it be a work of high claim, a poem worth considering at all, he mentions its excellences and points out its defects. If it be the poem of a famous poet, and the poet's fame seems to the critic undeserved, he does not hide the fact, but declares it upon evidence. What he aims to do is to give his reader a scientific statement of the value of the work, not of the intention of the author, nor of his amiability, nor of his virtue, nor of his public service or his private charm.

This he does in every case, and simply because

it is his duty in every case. Mistaken he may be, but he is honest. Some authors he may seem always to praise, and some always to censure. But he neither praises nor blames unreservedly. And if there be a constant apparent favor toward one and disfavor toward another, the reason is not to be sought in the critic, but in the author. A man who writes a foolish book this year will not probably write a wise one next year. And when next year's book comes, the same science which detected the folly in one combination this year, detects it in another combination next year.

This kind of criticism—and nothing else is criticism—is sound and healthful. Now, dear fellow-sinners in all the arts, do we really like it? There are a great many books published in this country during a year. How many of them are actual additions to literature? How many of them which are so have not grave defects when tried by any ideal standard? And is not that precisely the duty of the critic, to try by an ideal standard? Here is young Carlo Dolce, who exhibits for the first time this spring, and his picture is a Madonna or a Magdalen. It has been prodigiously puffed and praised. There have been paragraphs sparkling in all the papers about this wonderful genius that has suddenly appeared to usher in the noontide glory of American art. We all hurry to the Academy: and probably Criticus of the *Mortar and Pestle* is of our company, if we could only single him out. We hasten up the noble staircase, and enter the great hall, and there—you remember where—we see the Magdalen or the Madonna.

We look at it attentively, and the Easy Chair is sure that the President of the Academy, like Criticus and the rest of us, in studying that picture, does really try it by an ideal standard. Not necessarily by the Madonnas of Raphael, although that is a legitimate course. If Carlo Dolce has added nothing to the conception of the Madonna—if, on the contrary, he has lowered it not only from the ideal but from Raphael, then it is fair to say so; and then, however fine his touch and skillful his manipulation, the highest value is wanting in his picture. If the color is exquisite, and the *chiar-oscuro* so delicate and masterly that the idea of the work is forgotten, and only the charm of the handling remains, let us all say so; and Criticus will say so first of all. But if he says that only, it is not sound and healthy criticism; because in a truly great picture there must be something more than fine handling and beautiful color.

If the Easy Chair at this point understands the brethren to say that they agree with it in this, but that they deny that criticism is generally impersonal, the Easy Chair replies again, that we have ourselves to thank for it. For instance, Mr. Stentor shouts through the monthly *Trumpet* that he is sick to death of the eternal tame amiability of the Easy Chair. What follows? The Easy Chair is invited to dine that very day with the Second Vice-President of the Academy, and Mr. Stentor is also invited. They meet at that cheerful feast. The Easy Chair arrives first, and is blandly talking with Mrs. Second Vice-President, when the door opens—the house, you remember, is small—and Mr. Stentor appears. He is a man of the world, and he enters entirely unruffled—meaning his aspect, not his linen. But

at the first glance he sees the Easy Chair, and he says to himself, "I wonder if it has seen what I said about it in the *Trumpet*!"

Now, as you are well aware, despite this assumed amiability of tone, the Easy Chair is as peppery a piece of furniture as you are likely to find in any office or drawing-room. Of course it greets Mr. Stentor in a very grand and lofty way. Apparently it smiles, and says, "Good-evening, Mr. Stentor." But really, as we all know who have been similarly treated in the public prints, it says in its heart, "You vile reptile, kicking is too good for you!" That feeling naturally infects its manner, and Mr. Stentor, who has always felt a personal kindness for the Easy Chair, goes away a little resolved—since human nature is weak—to be even with it upon every occasion. Plainly, the Easy Chair has done its best to make criticism personal by feeling offended and showing it. It has greased the bare pole which it is Mr. Stentor's duty to climb.

Of course it does not deny that there is often a gross and intentional personality in what is called criticism; nor that a witty and sarcastic humor can not always refuse itself the pleasure of a pointed and pregnant gibe. There are men enough who have sacrificed friends to jokes, and a critic is sorely tempted. Just drop in at the Academy and look at Gilliflower's performances, and declare upon your honor what is the duty of a critic in regard to them. Shall he cover them with the ridicule that they invite, or gravely show their worthlessness, or pass them by in silence? If you do the latter, upon what principle do you proceed? Is it that you do not wish to hurt his feelings or injure the sale of a poor man's wares? But that is a principle which must hold your pen wherever you can not praise; a course that makes all remarks upon the Exhibition valueless. If a thing is irretrievably bad, leave it. The object of criticism is not to put an artist or an author in the pillory and expose him helplessly to the ribald taunts and blows of the mob, but to help him by showing where he has failed as well as where he has succeeded, to befriend promising talent wisely, and to discriminate, not to idolize. Therefore, the true reason for not speaking of those monstrous things of Gilliflower's is, that it can not be of any conceivable use. But if you can not help him, you have no right to make sport of him. He may be a painter with no gleam of talent; but he may also be a man with the most sensitive feelings, and when you hold him up to the ridicule of every reader of a great paper, merely because you are a witty fellow, why, you are a bully also.

As for those of us who are criticised, let us cultivate philosophy. When we appeal to the public by issuing a book or an article, or by designing a cathedral or by painting a picture, or in whatever other way we may do it, we have chosen our tribunal, and must abide by its judgment. It is very foolish for the poet to say that only poets should criticise poetry, or for the painters and sculptors and architects, and men of every art, to insist that only artists shall criticise works of design. The Easy Chair would much rather throw itself and the eternal amiability, which exasperates Mr. Stentor, upon a jury of general readers than upon one composed of the other Easy Chairs. Would the singers like to have the other singers write the articles upon their

warblings? Would Sassoferrato like to have Carlo Dolce or Gilliflower pass judgment upon him in any of the impartial journals of the city? Certainly not. He does not paint for the painters, but for all of us. Would you be a poet's poet, or a people's poet?

Perhaps before these observations get into print there will be changes at the Academy, a new dynasty and high promise and expectation. If the new dynasty could find a teller-of-truth in ordinary to the annual exhibitions, what lively times we should see! The Easy Chair thinks it beholds him—or why not her?—severely impartial, knowing nothing but the canvas before him, and the history of painting and painters, and the principles that, in his opinion, should govern the painting of pictures. If Omega, N.A., who has been sedulously devoted to his art for fifteen years, and as many more as you choose, still paints as wretchedly as he has always painted, let the truth-teller state that fact generously, but firmly. If a man is still making pot-hooks imperfectly at forty years of age, it is mere humanity to tell him that he will never learn to write. This is not the silence of which we were speaking just now, but it is a kindly truth-telling; and although it may be of no service to the painting, it may be of the utmost use to the painter.

For it is the tone of the criticism which exasperates, not the substance. Often and often the Easy Chair begged Thomas Tomahawk to remember that it was not the surgical operation that he performed in removing the scalps of what he considered offenders, but a certain savage glee which the victims supposed they detected in his manner, a kind of triumphant war-whoop style, which put them into great wrath. He not only brought them to the block, but he carefully observed every hideous detail of the punishment anciently awarded to high treason. The sufferer was not only executed, but he was hung, drawn, and quartered; and indeed the scene was painfully gory. Let us have no more of that. It is a clumsy headsman who can not sever at one clean stroke.

But these are sorry images with which to encumber our minds as we ascend the sparkling steps and enter the noble halls of the Academy. Did the Easy Chair hear a remark to the effect of "Fee, faw, fum," and see a gentleman with a note-book beside it? Don't smack your chops, my friend, as if you had a ravenous appetite! Slashing and swashing is not criticism. Criticism is telling the truth simply, and with a manly sympathy for all honest effort.

THE shops in the great city of New York, if the other great cities will pardon the expression, are certainly becoming very brilliant and entertaining. If the stranger, on any pleasant day, finds himself near Corporal Thompson's Broadway Cottage he will be in the midst of a very pretty scene. Of course the intelligent stranger demands to know where this romantic cot may be found. Perhaps he is comfortably seated in it, with his feet placidly reposing upon its window-sills, as he reads these words and asks the question. It is indeed in a new form. It no longer looks, as it did to the early citizen of twenty years ago, driving out before breakfast upon the Bloomingdale Road, and surveying the calm river from the seclusion of Stryker's Bay. It

had an indefinable road-side English air in those far-off mornings. The early citizen would not have been surprised had he heard the horn of the guard merrily winding, and beheld the mail-coach of old England bowling up to the door. There were fields and open spaces about, for it was on the edge of the city that was already reaching out upon the island. Bloomingdale! 'Twas a lovely name, and 'tis a great pity that the chief association with it is that of a very dusty road.

Meanwhile, if you will contemplate the Fifth Avenue Hotel you will see Corporal Thompson's Broadway Cottage in its present form. But what a busy, brilliant neighborhood it is now! There are shops that recall the prettiest upon the Boulevards in Paris; and the people are greatly to be pitied who are too fine to stop and look into them. But what a power Mrs. Grundy is! What scion of the golden youth of this moment would dare, for instance, to walk by the site of Corporal Thompson's Broadway Cottage eating an apple at three o'clock in the afternoon? There was a grave and well-dressed gentleman who stopped recently at the stand of Mrs. M'Patrick O'Finnigan, which is just in the midst of the gay promenade, to transact some business in pea-nut candy. The interest of the public in that operation was inconceivable. If he had been Mr. Vanderbilt buying out Mr. Fisk—if he had been a lunatic, or a clown escaped from the circus—he could hardly have excited more attention. The passengers stared in amazement. Some of the young gentlemen, escorting certain young ladies from school, cracked excellent jokes upon the honest buyer of pea-nut candy; and if his daughter or any friend had chanced to pass, and had seen him, she would probably have been seriously troubled and half ashamed.

Now pea-nut candy is very good, and at Mrs. M'Patrick O'Finnigan's stand it is a very cheap commodity. Nobody is ashamed of liking it, nor of eating it. If the grave gentleman had stepped into Caswell's handsome shop, let us suppose—where perhaps it is also sold—and had called for that particular drug, nobody would have stared nor made a joke nor felt that it was extraordinary. It is one of the queer whims of Mrs. Grundy, who regulates our lives. How many of the brave generals in the war, who charged in the very face of flaming batteries, would dare to stop at Mrs. O'Finnigan's and buy ten cents' worth of pea-nut candy, if they saw Mrs. Sweller's carriage approaching, or Miss Dasher just coming upon the walk? And as for the Misses Spanker, who daily drive in that superb open wagon with yellow wheels, and who resemble nothing so much as the figures in a Parisian doll-carriage, if they saw an admirer of theirs bargaining for pea-nut candy at a street stand they would not know him—they would no more bow to a man so lost to all the finer sense of the *comme il faut* than they would nod to a street-sweeper. It is astonishing what an effect is produced upon some human beings of the tender sex by clothing them in silks cut in a certain form, and seating them in a high wooden box on yellow wheels.

And upon us also. When the Easy Chair beholds the silken Misses Spanker rolling by superior upon those yellow wheels, it is with difficulty that it recalls the cheese and sausages from which all that splendor springs. To-morrow it will be

Mrs. O'Finnigan's grandchildren who will look down from their yellow wheels at the pea-nut and apple stands, and wonder how persons can be so vulgar as to buy candy in the streets. It is a whim of Mrs. Grundy's. She will not let us buy a piece of simple candy at the corner, but she will allow us to drag a silk dress over the garbage of the pavement. 'Tis a whimsical sovereign. But we are so carefully trained that it is not easy to disobey her. If to prove your independence you stopped to buy the candy, would the pleasure of asserting yourself balance the unpleasant consciousness that you were wondered at and laughed at?

But the text was shops, and we have drifted into this episode because Mrs. O'Finnigan sells pea-nut candy in her shop upon the sidewalk near the site of Corporal Thompson's Broadway Cottage, in the midst of the gay spectacle of a summer day. And within a stone's toss of her stand how many fine houses you will see, and how many other fascinating shops! Our English ancestors were called a shop-keeping nation by Napoleon; but it is his own French men and French women who have the true secret of shop-keeping. They make shops fascinating. They have made shop-keeping a fine art. The other day the Easy Chair stepped into a shop in Maiden Lane, prepared to spend a very pretty sum of money—for a very proper purpose. But if it had invaded the shop-keeper's house, which is his castle, it could not have been more coolly received. The disdainful indifference with which its question was answered was exquisitely comical; and the shop-keeper proceeded to look for what was required with a superb carelessness, and an air of utter weariness and disgust of this incessant doing of favors to the most undeserving and insignificant people. It was plainly an act of pure grace that the Easy Chair was not instantly shot into the street as rubbish, or given in charge to the police as a common vagabond.

This worthy attendant—doubtless very estimable in his private capacity—is a serious injury to the business which he is supposed to help. He does not in the least understand his profession. Let an Easy Chair advise him to run over the sea to Paris, and observe how they keep shop in that capital. Does he want a cravat? Here is a houri, neatly dressed, evidently long waiting for him especially, and longing to serve him. "Is it a cravat that Monsieur wishes? Charming! The most ravishing styles are just ready! Is it blue, or this, or that, that Monsieur prefers? Monsieur's taste is perfect. Look! It is a miracle of beauty that he selects. Will he permit?" And before you know it, you foolish fellow, who don't understand the first principle of your calling—before you know it, she has thrown it around your neck, she has tied it deftly under your chin, and that pretty face is looking into yours, and that pleasant voice is saying, "Nothing could be better. It is the most smiling effect possible!" You might as well hope to escape the sirens as to go from under those hands without buying that cravat.

This is shop-keeping, and a little study of the art, as thus practiced, would be of the utmost service to the Easy Chair's friend in Maiden Lane. The shops there are pretty, and especially during the holidays they are glittering, but they are a little cold and formal. The air of the Bou-

levards is to be detected only in the neighborhood of Corporal Thompson's Broadway Cottage. Whether cravats are wafted around the buyer's neck, as it were, entangling him hopelessly in silken and satin webs, the Easy Chair does not know. But it can believe it as it passes by upon the outside, and beholds the windows which Paris could hardly surpass. Through those windows it sees that, as in Paris, the attendants are often women. It is thereby reminded that in Paris the women are among the most accomplished accountants also; and it remembers that in the same city men are cooks. It is very sure that when Madame Wells, who was afterward the Marchioness De Lavalette, became at the death of her husband the head of the great banking-house, her cook was a man.

And thereupon the Easy Chair falls into meditation upon "the spheres" of the sexes, and asks itself, as it loiters about the site of the Broadway Cottage, admiring the pretty shops, whether, if it be womanly for a woman to keep a shop and to acquire property by her faithful industry, it can be manly to appropriate and use her property without her consent?

THE M'Farland trial was of a kind that always excites a great deal of popular interest. The court-room was daily crowded. The newspapers that daily chronicled the details of the proceedings were evidently strong partisans. The appeals and assertions of the counsel for the defense were—to those who supposed that the object of a trial is the discovery of the truth and to do justice—most extraordinary and unpardonable. If the object of a trial is not justice, but a verdict, as is often said by neophytes in the profession of the law, then it is a very contemptible profession, and sadly needs the reformation which has been undertaken in the city of New York.

There was a great deal very imposingly and edifyingly said by the counsel about "the solemnity of their oaths;" and after the most sonorous explosion of epithets in regard to points that had not been proved, nor even yet introduced into the case, one of the counsel, with an exquisite sense of comedy, gravely remarked, "No one shall be assailed by this defense." Perhaps a lawyer in high criminal practice does not understand what is meant by "assailing" other persons concerned in a trial. Possibly to stigmatize them by the foulest epithets in the language is "legitimate" advocacy. The ways of courts and of lawyers are inscrutable. But a judge has discretion; and when the Easy Chair is chief justice it will hear the opening counsel state what he intends to prove. But if in stating his intention he grossly insults and maligns persons against whom there is no charge whatever, the court will peremptorily silence the counsel and rule that blackguarding is not good practice.

This case belongs also to a class of cases upon which the public mind seems to be decided. The last conspicuous one in the State of New York was that of General Cole. Nobody supposed that he would be convicted or punished. Indeed it is not supposable that a man would be capitally punished upon the clearest conviction of homicide, under the circumstances either of the Cole or the M'Farland case. The reasoning, such as it is, is very brief and conclusive. The offense alleged is not easily susceptible of proof; but it

is held that the injury to a man's honor by another man who wins his wife's affections is so mortal, whether the wife leaves him or not, that, as the law provides no adequate remedy, he may himself punish the offender. If, therefore, the husband shoots the other man he will unquestionably never be seriously punished for the act.

This is really giving to jealousy the right to murder. For we must not be confused by the word honor. A father's honor is not mortally injured, nor touched in the least degree, by the forgery of his son nor by the shame of his daughter. He may be infinitely grieved and mortified, his heart may break and his hairs go down with sorrow to the grave, but he is not dishonored. Nobody can dishonor a man but himself. If a man commits a dastardly crime, for which he is hung, his family may be bowed to the earth with grief that their father is dishonored. But they are not; and the feeling of others for them is one of pity and sympathy, not one of condemnation nor contempt.

It is in this incapacity of a truly honorable man to be dishonored by another that a civilized mind sees the exquisite absurdity of what was called the code of honor. It put the best men at the mercy of the worst. Here, for instance, was a hulking bully and dead shot, who took a dislike to some man infinitely his superior. He met him at table, and threw a glass of wine in his face, or he spat at him, or he pulled his nose, and it was straightway held that the honor of the assaulted man had been injured, and could only be repaired by giving the bully the chance to murder him and ruin his family. Nothing more preposterous is conceivable; and it was this silly theory of honor that so long perplexed, and, to a certain degree, still perplexes, civilization. This theory of honor said: "If a man pulls your nose, he has mortally insulted you, and nothing but blood can atone. Ho! for the field of honor!" Common-sense says: "If a man pulls your nose, he breaks the peace. Call a policeman, and—Ho! for the station-house!"

Of course, if you don't choose to call a policeman, but instinctively do your best to thrash the bully, nobody will complain. But you are not dishonored by him, even though he pulled your nose off, and, when you tried to punish him, doubled you up and left you senseless in the gutter. Could a drunken bully, or a sober bully, dishonor Sir Isaac Newton by pulling his nose? Would Mr. Bryant be dishonored if somebody gave him the lie? It is by lying that he would be dishonored, not by somebody's saying that he lied. If, therefore, every man be the guardian of his own honor, and that honor can be touched only by himself, it is idle to speak of somebody else as dishonoring him. Somebody else may exasperate him—may madden him, by exciting his jealousy, as Iago maddened Othello—but somebody else can not dishonor him; and, in such cases as we are considering, honor is always invoked, and the injury to honor is elaborately alleged, because it is universally felt that if jealousy is to be allowed to shoot at discretion, there will be a good deal more shooting than society can safely tolerate.

All intelligent people will agree that the honor of the marriage tie must, in reason, be equal upon both sides; but every body knows that it is not considered so in fact. Take any average

jury that would acquit a husband for shooting a man who had "injured his honor," and it would wink at the same husband injuring his wife's honor in precisely the same way. These are subjects not to be easily mentioned; but they are well understood, and it is not for men, as a class, to vociferate too loudly about matrimonial honor. Gibbon caustically says of the goddess who presided over the peace of marriages: "Her epithet of Viriplaca, the appeaser of husbands, too clearly indicates on which side submission and repentance were always expected." And was the offense supposed to come usually from the same side?

The honor of marriage is mutual. Husband and wife are alike bound by it. But the defection of either dishonors that one only, and not the other. The other may be sorely grieved and humiliated—may be even excited by passion to what is called frenzy. But that is the possible effect of all strong excitement, and it is not changed in character because it is called the madness of outraged honor. It is very possible that one man, under the same circumstances, would do what another does. A man of Othello's temperament would be affected as Othello was. But, when public opinion authorizes persons laboring under strong excitement to shoot other people, it is only necessary to establish strong excitement to justify shooting.

The worst of a trial like that which lately occurred in New York is the total perversion and distortion of facts. Most of the acts and words of every person may be tortured into a significance and even a consistency which are utterly foreign to them. This truth, of which we are all conscious, is the theme of Wilkie Collins's novel of "Man and Wife," which is now publishing in *Harper's Weekly*. The simplest expressions, the most innocent conduct, are there made to entangle wholly unsuspecting and honorable persons in the meshes of a tragedy. On the other hand, while innocence is thus at the mercy of clever misrepresentation, guilt may be as ingeniously evaded. If you knew the habits of Mr. Toodles, for instance, and he were charged with an offense, and in order to establish his guilt it were necessary to prove that he was a drunkard, you would appeal in vain to the staggering step, the bleared eye, the thick voice, the rampant cravat end. A skillful counsel would cover you with confusion in the cross-examination, would appeal to the jury that your blushing hesitation betrayed you as a probable accomplice in a fiendish conspiracy, and would triumphantly acquit the outraged Toodles with a kind of martyr's halo around his head.

A man is charged with an offense which it is not denied that he committed. A defense is necessary. Ingenious counsel carefully study the facts. They fit them to various plausible, or at least defensible theories, and after careful deliberation they decide to which theory the facts may be made to conform most consistently. That theory they adopt, and strive with every art, strive unscrupulously, to establish. Every man remembers how curiously his *ipsissima verba* have been made to affirm what he denies, and to support what he opposes. There is nothing which every man who speaks or writes in public must sooner learn than the folly of chasing misrepresentations and misconstructions with the hope of end-

ing them. He might as well chase these spring cloud shadows upon the grass and hope to trample them out. You have been imprudent, you have been extravagant, you have gushed in correspondence, for instance, and lo! with the best friendly intention in the world, you are proved by your own words to be a conspirator and things not to be named. You refuse to join a general outcry of shame upon those whom you honestly believe to be guiltless, however mistaken and imprudent, and instantly your words and conduct are thrown in your face to prove

that you connive at a "hellish" ceremony, and that you are "an apologist for adultery."

Meanwhile, good friends, let nobody be alarmed. Snug, the joiner, is a spry little fellow, but he is by no means a lion. Ten thousand newspapers may scream that two and two make five, and that he is a noisome pest of the human species who denies it. But two and two still make four. Yet what a blessing that public virtue has such bulwarks as some of those newspapers that we all know, and which daily inform us how virtuous they are!

Editor's Literary Record.

POETRY.

LET us frankly confess that we do not approach W. C. BRYANT'S translation of the *Iliad of Homer* (Fields, Osgood, and Co.) in a frame of mind at all befitting the unprejudiced critic. We owe him too great a debt of gratitude for the enjoyment he has given us to be in any mood of mind to criticise.

While radical philosophers are impatiently demanding the exclusion of Greek and Latin from our college curriculum, the poets, who feel the public pulse a great deal quicker than the philosophers, are at once indicating and satisfying the appetite of the unlearned for the romance of the past. Not only are Lord Lytton, Professor Coningsby, Mr. Merivale, and Lord Derby employing their best thoughts in rendering the odes of Horace and the songs of Homer into English, but Tennyson, in what has proved on the whole his most popular poem—for it is really one, though in form several—is reviving the legends of ancient England; and William Morris, on whom the critics are inclined to bestow the poet laureate's crown which now rests on the brows of Tennyson, earns all his laurels by graceful pictures which he paints of times still more remote. And now W. C. Bryant adds his testimony to the public want, and his provision for it, in seeking recreation from the laborious duties of the editorial sanctum, and relief from a great domestic sorrow, by turning the hexameters of Homer into English verse.

It may, indeed, be that "if the *Iliad* or the *Odyssey* could now be given for the first time to the world divested of its traditional claims, and put upon its intrinsic merits, it would fall still-born from the press." It is doubtful whether the philosophy of a modern Plato would command so great a sale as that of Mr. Wells; or whether a modern Shakspeare's plays could get a place upon the stage at all; or whether a modern Raphael would secure as general and widespread a popularity as *Nast*; or whether Paul would be a widely popular preacher. Books, like plants, are both annual and perennial. There are that perish, like the Madeira vine, in the very year that gave them birth; there are that, like the oak and elm, get not the full glory of their growth till many years have passed over them. The glory of Homer is his age. He is grand because he is antique. It is Rufus Choate, if we remember aright, who once said that he should die if it were not for the classics. Wearied with

the strife of the office and the court-room, exhausted but sleepless, he threw himself into his easy-chair, and in ten minutes, in the life which Homer opened to him, had forgotten his own. The modern romance is not thus restful. It carries us into a world too like our own. But the song of Homer transports us into another world than ours, and gives to the wearied brain a rest more sweet and healthful than sleep itself. It is this appetite for rest which the "Legends of the Round Table," and the "Earthly Paradise," and last, and best of all, the new translation of Homer, are written to satisfy. The number of men that can find restful reading in the original Greek are very few, and grow yearly less. The number who know Homer at all except as the school-boy knows him, as an exercise in parsing, are, in America, with its hurried life and its intense and hard practicality, so very few that we may almost say there are none at all. There have, indeed, been no lack of previous translations, from the jingling and curiously un-Homeric lines of Pope, to the plain, bald prose of Buckley; by scholars, too, of all degrees of merit, from some to whom Greek was as mother-tongue, to other some who scarce knew the first principles of its syntax. Indeed, one Italian poet, Vincenzo Monti, translated the *Iliad* without knowing a word of the original, simply from Homer's previous translators. But of all which we have seen—though to have seen, at least to be familiar with them all, would itself require almost a life's study—there is none to equal this work of our own poet. Nor can we conceive a medium more fitting for the rendition of the legends of the greatest of all bards than the blank-verse of the author of "*Thanatopsis*," the rhythm, natural grace, and stately dignity of whose lines are all his own. One thing alone we count unfortunate, that the style and price of publication should be such as absolutely to debar the book from those who need it most, and would be most glad to read it. It is too good a book to lie with uncut leaves upon the centre-table as a parlor ornament, the fate to which its present form threatens to condemn it.

"What is really best in any book," says Ralph Waldo Emerson, "is translatable—any real insight or broad human sentiment.....I should as soon think of swimming across Charles River when I wish to go to Boston as of reading all my books in originals when I have them rendered for me in my mother-tongue." This senti-

ment, uttered by so scholarly a man as Emerson, is as comforting as it is courageous, and is none the less bold because it is true. We call it comforting, because, in the nature of the case, there are very few who can ever master a foreign language so perfectly that they can really read enjoyably its literature; and certainly one may get from such a translation as ELLEN FROTHINGHAM's version of GOETHE'S *Hermann and Dorothea* (Roberts Brothers) a far better idea of the real meaning of the original than he could possibly do by stumbling through it with a grammar and a dictionary. In the former case he stops at the words; in the latter he apprehends the poem in its entirety. It is true that of all literature poetry, and of all poetry German poetry, is the most difficult of translation. It is true that in translating this particular poem it is specially difficult to preserve the simplicity of the original without degenerating into a commonplace baldness. But despite these difficulties the translator has very happily accomplished her work, and has given a very charming and truthful, though not literal, version of what is not the greatest, but, next to "Faust," is perhaps the most popular, product of Goethe's pen. It is just a simple pen-and-ink picture of German life—peasant life we were going to say, burgher life we perhaps should say. To one who has never read it we might describe it as the "Evangeline" of German literature, though a critic would justly object to the comparison. We find no better way to characterize it in a sentence than by borrowing from the pages of De Quincey his estimate: "'Hermann and Dorothea,' a narrative poem, in hexameter verse, appears to have given more pleasure to readers not critical than any other work of its author" (we except from De Quincey's statement the master-piece of his genius, "Faust"); "and it is remarkable that it traverses humbler ground as respects both its subjects, its characters, and its scenery." It is, indeed, a portrait rather than a poem; describes the real, not the ideal; and depends for its charm less upon an appeal to the imagination, or even the sentiments, than upon an exhibition of that real romance which the poet's eye discerns, and all true hearts are glad to perceive, beneath the working-garb of everyday life. No one can read and note the contrast between the father's sorry but common idea of nobility and that which Hermann entertains, and the dowerless Dorothea exemplifies, without a new discernment of the truth that "all is not gold that glitters," and a new reverence for that kind of nobility whose "star and garter" is wrought in the heart, not worn on the breast.

CHARLES G. LELAND, in his new version of "Hans Breitmann"—*Hans Breitmann in Church* (T. B. Peterson and Brothers)—discloses a genuine poetic power which he has hitherto either never developed or never disclosed. We have expressed in decided terms our own opinion of that stale device of American wit which consists in hideous spelling and unendurable grammar, and slang yet more unendurable; and the opening verses of the new ballad only add intensity to our convictions. The original of such a profane, roystering, half-drunken "bummer" as sat for the portrait in this verse would not seem funny to us, and we fancy the portrait no better than the "sitter."

"Und first der Breitmann vildly shmiled,
Und denn he madly shvore
Crate h—l mit shpoons und shinsherbread,
Can dis pe makin' war?
Verdammt pe all der discipline,
Verdammt der Sheneral;
Vere I vonce on de road, his will
Vere Wurst mir und egal."

There is one German artist, whose name we have at this moment forgotten, who is prolific in pictures of wine-cellars, and drunken carousals, and red-nosed debauchees. His pictures are true to nature, but such nature! Pah! Who would not gladly shut his eyes upon it? There are scenes and characters it is not worth while to paint: the truer the painting, the worse the picture.

But in the closing verses of this new ballad Mr. Leland discloses a new power—a new phase of his own life. Hans Breitmann goes with his cavalry to church after some whisky, which a contraband reports as hid there. They find it, and are soon deep in a wild drinking bout. In the midst of it they are surprised by the "rebs," a battle ensues which results in leaving Hans master of the field; but his friend Stossenheim is mortally wounded. The verses that follow describe the dreams which "coom o'er de soldier" as he lies "dyin' all alone," dreams of his "mutter" and his "frau" and the "shild" that

"— learns to shpeak a fader's name
Dat she nefer will shpeak to him;"

they describe his death "like a Christian soldier," and the burial, when

"De tramp of horse und soldiers
Vas all de funeral knell,
De ring of sporn und carpine
Vas all de sacrin bell."

In these closing verses there is real pathos and genuine poetic merit—a pathos which not even the mongrel Dutch-English in which they are expressed is able to obscure. They are good enough to have been written in a pure language, and prove that Mr. Leland has no need to forego his better and higher nature to play the buffoon for the sake of amusing the crowd.

NOVELS.

MISS MULOCK'S *A Brave Lady* (Harper and Brothers) is a worthy companion to her "John Halifax, Gentleman;" and we know not how to award it higher praise. The one describes the ideal Christian gentleman, the other the ideal Christian lady; and among ideals Lady de Bougainville is the worthy peer of John Halifax. Amidst all this agitation for another and wider sphere, and for larger and better opportunities of work, and a ripper development of character—amidst all this discontented turning away from the narrow home circle and its labors, its battles and its victories, as though they were somehow unworthy the capabilities of woman, one delights to find so healthful a recognition as this book affords of that true heroism, that true nobility, which is able to dignify the commonest sphere, the lowest and humblest station. It is not the post but the heart that makes the soldier. Heartily as we desire to see the range of woman's life widened—heartily as we believe that both she and society require her emancipation, yet we are even more certain that no opportunity is lacking in her present place for a

truly noble life. The wife of a poor English curate, an unconscionably selfish curate, a wretchedly dishonest curate, a wife who can not respect her husband and therefore can but illy love him at the best, has yet the opportunity afforded her to fight a great battle, to win a continuous victory, to be in her little cottage and her muslin dress not only a "brave lady," but truer lady than many a one who looks with ill-concealed contempt on Wren's Nest. An old moral, you will say. Well, it is not a new one; but the world has not as yet learned it so well that it has no need to review the lesson; and certainly it could ask no more charming or capable teacher than Miss Mulock. Sometimes, indeed, we get out of patience with Lady de Bougainville's patience, and wonder if it be not true that "endurance sometimes ceases to be a virtue;" and we get utterly and hopelessly out of patience with her husband, who is not a big rascal who rather awakens your interest by his rascalities, but only a mean and conscienceless Irishman, who always means to do right when it costs nothing, but who has no capacity for self-sacrifice, and binds heavy burdens on his wife's shoulders which he does nothing to lift, no, not so much as with his little finger. But these are the rascals of our common life, not the Quilps, nor the Uriah Heeps, nor the Iagos, nor the Dick Turpins whom we meet in literature; and endurance is so infrequently sufficiently immoderate to become a vice that we can submit to a little overplus in romance. And yet if we gave the impression that this is in any sense an anti-woman's-rights novel, we should give the falsest conception of it. It is, on the contrary, a most potent plea for woman's complete emancipation, portraying the real misery of the "subjection of women" in a picture that will touch many a heart which would be unmoved by Mr. Mill's unimaginative description of the same shameful fact, and a cry, such as will be heard, against the false political economy which sustains such legislation and the false exegesis which palms it off upon the Apostle Paul. Artistically there is great skill displayed in portraying the gradual change which life's sorrows produce in the character of Lady de Bougainville, and in the gradual separation which mutual development of character produces between the husband and wife. In essaying to write a novel that is not in any sense a "love-story" Miss Mulock has undertaken a difficult task, and she has accomplished it with success. In undertaking to keep up the interest of the reader in a serial story without plot, with very simple incidents, and with little other material for the drama than the brave lady and her cowardly husband, she essayed a dangerous experiment, accomplished with a success to which the many readers of this Magazine who have followed the story of her life from month to month can bear witness.

Of *Casimir Maremma* (Roberts Brothers) what need we say more than that it is a new novel by the author of "Friends in Council" and "Realmah," written, as every thing that ARTHUR HELPS writes, for a purpose—a novel part romance, part political economy, part criticism; with possibly a little too much of political philosophy for a romance, and a little too much romance for a work on political philosophy; but at all events, whatever else it be, not common-

place, and perhaps equally sure to attract the interest of thoughtful people and to awaken the interest of none others.—FREDERICK SPIELHAGEN'S *Hohensteins* (Leypoldt and Holt) is a much better novel than either of its predecessors. It is an intensely democratic novel of the revolutionary times of Europe, presenting a picture of German nobility which, if it were true, would justify the most rampant red-republicanism. There is here and there an outcropping of German infidelity, and of loose and socially destructive ideas of the marriage relation, which impair a story which is otherwise healthy as well as entertaining.—There will be many readers to welcome Appleton's republication of GRACE AGUILAR'S Works. That the most distinctively Christian of novelists lived and died a Jew, and was buried in a Jew's cemetery, must ever be considered one of the curiosities of literature. Certainly no reader would ever guess her religious faith from her works. How should he when they abound in such sentences as, "There is but one hope, our Saviour, for the sinner," and in such quotations from the New Testament as "There is more joy in heaven over one sinner that repenteth than over ninety-and-nine who have not sinned?"—*Debenham's Vow* (Harper and Brothers), by Miss EDWARDS, is a dramatic story, verging on the melodramatic—an English story, with some sensational episodes from our civil war, the most characteristic feature of the book being the blockade-running of the hero, if hero he may be called. It comes at last to a very natural but unsatisfactory termination, and inculcates a moral which one does not need to go to a novel to learn, viz., that love is better than money, and a bad vow is better broken than kept.—It is yet too early to speak critically of CHARLES DICKENS'S new novel, *The Mystery of Edwin Drood*. Dickens's forte is not in the construction of plots and the development of mysteries. His only successful plot is that of "Our Mutual Friend." We are not, at the time of this writing, conducted even to the threshold of the "mystery;" but we have read far enough to feel assured that the author has lost nothing of his power, has perhaps gained something by his long respite. The dialogue in the third chapter between Edwin Drood and Rosa is as capitally conceived and carried out as any thing Dickens ever wrote. The novel is to be published as a serial in a monthly supplement to *Harper's Weekly*.

JUVENILE BOOKS.

A NUMBER of years ago a few young men, of the humblest rank, in one of the manufacturing towns of England, meeting in the long winter evenings, in a sort of improvised school for mutual improvement, asked a gentleman of the neighborhood to come in and "talk to them a bit." He accepted the invitation; the result was a series of lectures, if any thing so informal can justly claim that name, on examples of what energy and perseverance had accomplished in the lives of the truly great men, the truly self-made men of the past. This quasi-lecturer was Mr. SAMUEL SMILES, and the informal lectures grew at length into an unpretending and anecdotal book with the significant title of *Self-Help*. This book, starting so modestly, growing up the author himself scarcely knew how, chimed in with

the spirit and met a want of the age. It was reprinted in America, translated into the French, the Dutch, the German, and the Danish. Its popularity surprised no one probably more than its author. It is a popularity well deserved. The heroism of the world's greatest benefactors, the heroism of the loom, the foundry, the mine, the office, and the counter has had few delineators, none better, none more heartily appreciative, than Mr. Smiles. "Self-Help" is a thoroughly manly book; a book that no boy can carefully read without being made better and stronger by it; just the book for father or mother to read from to the group of children in the evenings, when the day's toil and the day's sport are over; a book which will prove a far better incentive to industry than either a scolding or the rod; a book to go into every Sabbath-school library, though it inculcates chiefly the homely and everyday virtues which Sabbath-schools are apt to be oblivious of; a book well worthy of the second and revised edition which has been called for by the public, and is provided by the press of Harper and Brothers. The additions are very considerable, including sketches of such men as Bernard Palissy, Count De Buffon, Cuvier, Claude Lorraine, Nicholas Poussin, Ary Scheffer, and Francis Xavier. We place it in the front rank of "Juveniles," though it is something more than a "Juvenile"—something certainly very different from most books that fall into that class.

Miss ALCOTT'S *Old-Fashioned Girl* (Roberts Brothers) is to our thinking quite as good a story, quite as fresh, unconventional, and true as "Little Women," though it will hardly be as popular with the little folks. In fact, it is written for an older audience, and in a literary point of view belongs in a class by itself, being neither quite young enough for a children's story, nor quite old enough for a novel. "Tom" and "Polly" are genuine additions to American literature. We doubt whether failing is quite such a means of grace ordinarily as it proved in the case of the Shaw family, and the Toms and Fannys of real life do not develop such sterling qualities in manhood and womanhood out of material so meagre in early youth. But there is no more romance than is needed to give zest to the story, and he must be a very "proper" person indeed who can not give Polly the most cordial congratulations on her marriage to her erratic but reclaimed lover. Is it any sign of a popular uprising against the tyrannical reign of Mrs. Grundy that such a book as this is so popular? Or will the "girl of the period" read it only for the sake of a laugh at the old-fashioned girl, but with no thought of emulating her example or imitating her character?

There is many a performer who is no musician; many a young lady who, under the delusion that she is acquiring music, is only learning to hate the piano which she thrums so mercilessly. For this abhorrence of music, which is often the parents' greatest difficulty and the pupils' greatest obstacle too, there is no better remedy than a living sympathy with musicians; and when live ones are not at hand to inspire the yet susceptible mind with their own enthusiasm, the lives of the great musicians afford the best substitute. For this reason, not merely because it is a volume of useful and interesting biography,

we welcome the opening volume of the *Tone Masters*. (Lee and Shepard.) The author has thought it necessary, because she is writing for children, to employ a rather clumsy device to give her history the semblance of a romance. So we have a musical club which meets on certain evenings to perform the works of the great masters, allotting one evening in turn to each, and making the composer of the evening the theme of the evening's conversation. Despite this unnecessary machinery the story of the lives of Mozart and Mendelssohn is told in a way which makes us look forward with expectations of personal enjoyment to the succeeding volumes, which are to treat, it is said, of Handel and Haydn, Beethoven and Bach, and Schumann and Schubert. Nor is it the story of their lives alone which is told; some account of their principal works is given, and a very correct and appreciative idea of their musical characteristics is afforded in a very simple, succinct, but sprightly style.

Charles Scribner and Co. add to their admirable Illustrated Library of Wonders, translations of VIARDOT'S *Italian Art*, SAUZAY'S *Glass-Making*, and DE LANOYE'S *Sublime in Nature*. The latter is simply a compilation, a selection of extracts from various writers, and is neither in the character of its literary contents nor of its pictures equal to the average of its predecessors. The selections are well made, but the book has no unity. The second is a very entertaining treatise, chiefly devoted to a description of the rarer operations in glass-making, such as the manufacture of mirrors, goblets, vases, cut, gilt, frosted, filigree glass, etc. The author traces each operation in turn to its origin in past history, and the reader will be surprised to find how true it is in this art, which to most persons seems modern, there is almost literally nothing new under the sun. The engravings are but little inferior to those of the English version. Viardot's work gives the reader a very good idea of the history of Italian art, and the characteristics of its different schools. It would be a capital book for any one to read who means to visit Italy, and an interesting one for him to read who has visited it. The pictures do not add much to the book. Even the best engravings give but a very imperfect idea of the works of the great masters, and these engravings are not of the best.

MISCELLANEOUS.

RUMOR attributes to RALPH WALDO EMERSON a peculiar method of composition. He keeps, it is said, a commonplace-book, into which go every striking thought, curious metaphor, keen epigram, which his own mind incubates or his various reading discovers. When he is called on for a lecture, he goes to his commonplace-book. He culls from its pages enough of its best material for an hour's instruction or entertainment. Connection is immaterial. He exhibits his collection of pearls and precious stones, and notes carefully what strikes most the popular feeling. These he treasures up, culls, casts into paragraphs. This makes his book. We do not altogether credit Madame Rumor. Mr. Emerson is not the man to ask the public to select for him. He writes, above all other American authors, as one who is supremely indifferent to praise or blame. There is, too, in his disjointed

sentences a method, which they who study him discover, as in the constellations which stud the sky there is a real order which is hidden from the child. It must be confessed, however, that his terse, epigrammatic, and seemingly disconnected style gives color of truth to Madame Rumor's story. His last book—*Society and Solitude* (Fields, Osgood, and Co.)—adds this further evidence, that in it Mr. Emerson refers to his commonplace-book, and quotes from it. That he often quotes without referring, no one who is familiar with his writings can doubt.

"*Society and Solitude*" is, we need hardly say, a collection of essays. Ralph Waldo Emerson never writes any thing else. Of these essays, we have found that on "Books" the most interesting. It is less characteristically Emersonian; it has continuity—beginning, middle, and end; it really tells us something about books; it is comprehensible, with the exception of a few paragraphs, by the common mind; it gives an admirable, though partial and incomplete, course of reading; it gives some admirable hints to readers, along with some which are sufficiently absurd to do full credit to their parentage. If, for example, all readers agreed to the rule, "Never read any but famed books," all reading would come to an untimely end. The rule, "Never read any but what you like," is admirable for mature minds, and its application would save a great deal of wasted time. He might add, "Never read except as you like—always according to the mood of the hour." Whoever has met Henry Ward Beecher traveling can hardly fail to have noticed his inseparable traveling companion—a black leather bag. It is full, not of clothes, but of books. There is a volume of poetry, one of history, one of philosophy, one of science, one of art. Be the journey long or short, he always has his library with him. "Why take so many?" we once heard him asked; "you surely don't expect to read them all!" "Because," was his reply, "when I start I never can tell what I want to read. Sometimes I take some honey from each flower—sometimes I only open a single volume; I read according to the appetite." This is sound philosophy. Read what you like. The appetite is the only true guide—mood the true scholar's only true system. It is because Mr. Emerson reads only what he likes that his essay on "Books" is more a revealer of himself than anything else we have met with from his pen. That a man is known by the company he keeps, has passed into a proverb. Books are Mr. Emerson's companions, and this introduction to them explains both his strength and his weakness—his strength in the higher and subtler forms of intellectual life, his weakness in the absolute poverty of his spiritual resources. The ethical element, the conscience, the keen sense of right and wrong, the delicate sense, too, in matters where moral judgment becomes a moral taste, and even the refined imagination, closely approximating the higher and spiritual life, are not wanting; but the spiritual faculties themselves are absolutely dormant, and one can hardly fail to notice that among books there is no mention of those whose virtue lies in their spiritual power—none but the merest paragraph about "the Bibles of the world," and about these only as expressions of "sentiment" and of "the universal conscience."

There is an "unseen world," which the quick insight of a Paul, a John, a Melancthon, a Thomas à Kempis, a Fénelon, perceives, but which this rare thinker, with all the subtlety of his genius, never sees. Let us thank him for this much, at least—that, knowing nothing of it, he makes no attempt to hide his ignorance behind a flimsy veil of conventional phrases, borrowed from men whose visions he never shares. Mr. Emerson is, at least, honest; and that is much—we might almost say, every thing.

Mr. MURRAY, by his *Music-Hall Sermons* (Fields, Osgood, and Co.), has redeemed his name from the doubtful honors which his "Adirondacks" brought him. For twelve Sabbath evenings Music Hall in Boston was crowded to its utmost capacity to hear the popular preacher of Park Street Church. Something was doubtless due to the novelty of the occasion; something to the musical service, led by a choir of a hundred singers under the direction of Monsieur Tourjee; something to the somewhat doubtful reputation which the preacher had already acquired in circles far outside his own parish. But those who came to hear a "sensational" preacher, or to laugh over quirks and oddities, must have gone disappointed away; and yet, to the last, the audiences did not diminish. The fact that sermons so simple, so unpretentious, so little ornate, so utterly undogmatic, possessing so slight tokens of any peculiar scholarship, or any subtle poetic intuitions, or any keen analysis, in a word, characterized so little by any marks of peculiar genius, should have been *the* religious sensation of the Athens of America, affords a new evidence that the Gospel has not lost its power; that when it is not made to serve the recruiting purposes of a church, when it is not overlaid and obscured by the tenets of the schools, nor by an excessive and florid ornamentation, when it is the simple utterance of a heart in earnest, there is that in it which takes strong hold on all hearts; as much so as when Jesus proclaimed it among the hills of Galilee, or Paul among the cities and in the synagogues of Greece. Dr. Hall has set two classes of preachers in contrast—the plain and the poetic. One, he says, admits the sunlight through transparent glass, making the soul to glow with the warm light of heaven; the other lets it in through stained-glass windows, filling the soul with a soft, variegated, "dim religious light;" beautiful, but far from bright or clear. Mr. Murray's sermons are transparent glass. It is the light of the sun itself which shines through them.

Whoever has attended long at Plymouth Church will bear witness that HENRY WARD BEECHER is better in his pulpit than on the platform, and better in the prayer-meeting than in the pulpit. His *Lecture-Room Talks*, reported by his shadow, Mr. ELLINWOOD, and published from week to week in the columns of the *Christian Union*, gathered now in a substantial volume, make a book of rare devotional reading, and carry the reader nearer the great heart of their author than any thing else short of a personal and familiar acquaintance. Thanks, Mr. Ellinwood, for a service which makes Mr. Beecher's parish as wide as the bounds of the nation.—PYLE's *Expository Thoughts on John* (Carters) are exceedingly pleasant and profitable reading; and a commentary which is really both pleasant and profit-

able is a rarity indeed.—RANDALL'S *History of New York* (J. B. Ford and Co.) is a compend for schools. Why must the school compends always be a collection of uninteresting details, and children be frightened from the most fascinating of studies by the method in which it is presented?—*The Autobiography of Edward Wortley Montagu* (Turner and Co.), the scape-grace son of a scape-grace mother, in turn a Protestant, a gipsy, a Roman Catholic, and a Mohammedan, and about equally Christian in all, is a cynical, morose, flippant, misanthropical book, written by one who had neither faith in God, man, nor virtue, and has no value whatever unless it be in the portraiture of certain phases of English life in the time of George I., and until its authenticity has some better evidence than is as yet afforded us, this value is small.—The Memoirs of *William C. Burns* and of *James Hamilton* (Carters) are on the whole inspiring books, despite the fault of all religious biographies—too much ill-digested and ill-assorted matter. The former was the first Protestant missionary to China, and inaugurated the missionary work there by traveling alone throughout the interior, dressing like a Chinaman, and eating like him too, becoming all things to all men in truly apostolic spirit. His warm personal friend, James Hamilton, was, besides pastor and preacher in the great English metropolis, the most industrious of litterateurs, and did an amount of reading, writing, and studying which one would suppose to consort only with the idlest, while he was the busiest of men. His biography is, especially the latter half of it, a very healthful book to read

—a good book for you to give your pastor, reader, by way of inspiration and encouragement. An hour with it is like a whiff of oxygen among the mountains to a carbon-poisoned denizen of the city.—The proprietors of village and circulating libraries assure us that the bound volumes of *Harper's Magazine* are the most popular, the most in demand, of any books on their shelves. These forty volumes constitute indeed a library in themselves, of science, history, travels, and romance; the value of which will be greatly enhanced by the complete analytical *Index* now for the first time published, enabling the reader to find at a glance any subject treated of in the complete set. This index makes, in fact, the *Magazine* a cyclopædia. There is no way in which a man can get so large and so serviceable a library for so small a price as by purchasing this set complete with the index which accompanies it.—Whoever undertakes to build a house, we know, for we have tried, finds it necessary to get all the books of plans he can, and all the plans of his friends who have built before him, and spend from one to three months, according to the severity of the attack, in drawing all sorts of conceivable and inconceivable designs. This done, he is prepared to engage a builder or architect, tell him what he wants, leave the work of both building and designing in his hands, and go about his own work with a free mind. For those in the first stage of the building fever we know of no better book than BICKNELL'S *Village Builder* (A. and J. Bicknell, Troy). It is very pleasant to look through; and no architectural book is good for any thing else, except to the professional architect.

Editor's Scientific Record.

PRACTICAL APPLICATION OF THE TRANSLUCENCY OF METALS.

METALS have generally been considered as opaque bodies, not permitting the passage of light through their substance. It is, however, very easy to show, by the use of an extremely thin film, as of gold or silver deposited upon glass, that light passes quite freely through them; and this property has latterly been turned to very good advantage. One of the earliest applications was as a substitute for the ordinary soot-blackened or colored glass, used in observing the sun during an eclipse, or at other times; and the silvering of the objective glass of the great telescope of the Paris Observatory has permitted an investigation of the sun's disk such as could not otherwise be prosecuted. Viewed through a lens, or even a plain glass thus silvered, the sun appears of a soft bluish color, very sharply defined against a black back-ground formed of the sky. All the peculiarities of the solar image, the different spots and foci in their variations of intensity, and the less luminous marginal regions, are shown with the greatest clearness; and even the filmiest clouds and vapors which seem to sweep over the disk can be readily perceived. The examination can be kept up any length of time without strain to the eyes. The physiological action is very different from that of colored glasses, the use of which is sometimes very objectionable. All the different rays of light pass through

the metal (although greatly tempered), except the outermost red rays, which are excluded, together with the dark heat rays, and the silver must be deposited in the usual galvanoplastic or chemical manner, so as to form a very delicate film. Gold and platinum may also be used, but silver possesses several advantages.

This property, on the part of metals, of greatly subduing the rays of light without extinguishing them to any extent, and of excluding almost entirely the rays of heat, is now applied to other practical purposes. Weak eyes can use spectacles thus prepared to the greatest advantage, where colored glasses are not to be thought of. For persons whose business keeps them before a glowing fire such glasses are invaluable, since the sight is not strained by the light, nor the eyeball injured by the heat, which is measurably excluded. Screens of glass, to be placed before fires, have also been made on the same principle.

By inserting plates of glass thus treated in the panels of doors, or using them as window-panes, it will be easy to observe from within all that is going on outside, while it will be impossible to see into the room unless there be another window on the opposite side, so as to show through. The application of the metal to the glass converts it into a mirror, which reflects the light, and makes it to one outside as opaque as mirrors are generally. The use of such windows, where an observer within has occasion to notice persons

outside without being seen, will be readily understood in the case of prisons, work-shops, stores, etc., where, however, as already remarked, there should be but the one opening. The platinized glass has been found most convenient for this purpose.

These few illustrations of a general principle, capable of a great variety of practical applications, show at the same time how often the man of science, seeking for the solution of some problem in his theoretical investigations, reaches results capable of a thousand uses in everyday life, which are eagerly caught up and turned to profitable account.

CONVERSION OF TALLOW INTO BUTTER.

It is said that the legitimate demand for tallow in Great Britain is very seriously interfered with by the use of a large percentage of it in the manufacture of butter. The tallow is sent to Belgium, where it is kneaded up with a particular kind of meal, to which is added about thirty-five per cent. of water. It is then exported from Ostend as Flemish butter; and it is to be found under this name in the markets of London.

MAGNESIA LIGHT IN PHOTOGRAPHY.

M. Van Monckhoven has excited much interest in photographic circles by his invention of a peculiar form of illumination, by means of which he is enabled to take photographic pictures with great success. He uses for this purpose the carbonate of magnesia, heated to a white heat by an alcohol lamp or by the oxyhydrogen light. The magnesia, under these circumstances, gives a light equal in intensity to that of the metallic magnesium, and of the same color, but with the additional advantage that there is no smoke, and the light is very constant. The expense amounts to about fifty cents an hour. According to Dr. J. J. Woodward, the best, if not the cheapest, light for photographic illumination (sunlight not excepted) is that of electricity, the calcium light being the worst.

TRANSFUSION OF BLOOD.

A memoir recently published upon the transfusion of blood from one living subject to another mentions, as the principal points reached in the investigations of the author, first, that blood collected and kept in contact with the air at a medium temperature remains unchanged in its constituent histological condition, and preserves its chemical peculiarities for two or three hours; second, that the red globules, saturated with oxygen, are the actual revivifying principle, the fibrin not being an essential part. On this account, to insure safety, and to prevent the introduction of clots into the circulation, blood deprived of its fibrin is to be preferred to that in its normal condition. Third, the defibrinated blood of any species, transfused into an individual of the same species, can revivify that individual, compensating for loss of blood, fulfilling all the functions of the normal and primitive blood, and being subject to all its physiological laws. In the same way we can combat an alteration of the blood, by exchanging it for that which is healthy. Fourth, the blood of animals of one species can revivify, if even in a transitory manner, animals of another species. Such blood is readily decomposed, and if it has been injected

in small quantities it may be eliminated; if injected in large quantities it may produce death. Fifth, transfusion well executed is not a dangerous operation. The practical dangers signalized by the author lie in the introduction of foreign bodies with the blood, the formation of clots even in injecting the defibrinated blood, the introduction of air into the circulation, and the precipitation of the injection, and finally, phlebitis, or inflammation of the inner membrane of the punctured vein.

POKORNY'S ICE-MACHINE.

Another addition to the long list of ice-machines is that manufactured by Mr. Pokorny, of Vienna, based upon the ammonia apparatus of Carré. This machine, it is said, will furnish by continued use six or seven hundred-weight of ice per hour, with a consumption of about one-tenth of this weight in coal, being operated by a steam-engine of one half horse-power. Three workmen are sufficient to carry on the entire process, including the tending of the engine. It has been calculated that the actual expense, in Germany, of the material and labor, independent of the cost of the machine, is less than ten cents per hundred-weight of ice. The cost of the machine there, capable of furnishing one hundred pounds of ice an hour, is \$2500; one making five hundred pounds per hour, \$6000.

ARTIFICIAL CORAL.

The false coral of the jewelers is usually made of alabaster, colored by means of a bath consisting of half an ounce of cream of tartar, a quarter of an ounce of tin composition, and one quart of water. The tin composition is prepared from eight parts of nitric acid, one part of sal ammoniac, one part of tin, and twenty-five parts of water. To the bath thus prepared enough powdered cochineal is added to give it a proper degree of coloration; and the whole is then brought to the boiling-point, and, after boiling a short time, it is to be cooled and decanted. The alabaster is next introduced into this clear liquid and kept some hours, and then allowed to dry in the air. It is finally placed two or three hours in a bath consisting of equal quantities of stearic acid and wax. When the objects are removed from this mixture they are rubbed off with paper, and can be polished in the usual manner.

CURIOUS SHAPE OF BIRDS' BILLS.

We have in birds a great variety of form and adaptation of particular parts to special wants, under special circumstances, although it is in the bill that the greatest diversity, in this respect, is observed. This organ is sometimes very broad and shovel-shaped, sometimes very slender and elongated. It is frequently bent downward, sometimes in a gentle curve, as in the curlew; and in others at an abrupt angle, as in the flamingo; more rarely it is bent upward, as in the godwit and avoset. The most curious modification of its shape, however, has lately been announced in the case of a small species resembling the plover, and found on the coast of New Zealand. Here the bill is bent at a decided angle abruptly toward the right, and with the extreme point also slightly turned upward, so as almost to form a screw. This peculiarity is so singular as to have at first suggested the idea

that the first specimen was a monstrosity; but in more recent collections from New Zealand others were obtained, all agreeing in the shape above mentioned. An approach to this peculiar character of bill is seen in the case of the cross-bill, a small, sparrow-like bird of a red color, inhabiting the boreal regions of the northern hemisphere. In this the two jaws are natural in their position in the young birds; but with increasing age the points lengthen to such an extent that they cross, the one cutting against the other like the blades of scissors. They feed almost entirely upon the seeds of pines, which they are enabled to extract with great facility by means of this peculiar form of the bill.

ARCTIC VEGETATION.

Dr. Seemann, an excellent authority in all questions of botanical geography, thinks that if there be land present at the extreme north, at or near the pole, in all probability it will be found to be covered by some form of vegetation wherever it is not occupied by snow and ice. He states that the most northerly berry-bearing plant is a species of *Vaccinium*, a kind of whortleberry, found growing on the northwest shore of Greenland, at a latitude of seventy-six degrees north, and a longitude of sixty-six west. The other most northern berry-bearing genera are the cranberry (*Oxycoccus*), thimble-berry (*Rubus*), the cornel, or dog-berry (*Cornus*), and the *Empetrum*.

HIBERNATION OF DUCK-WEED.

A curious habit, analogous to that of hibernation among animals, has been observed in the duck-weed (*Lemna*), a well-known plant growing in and floating on the surface of fresh water. During the warm season the floating leaves are provided with small air-cells, by means of which they are buoyed up and kept at the surface; but in August or September new leaves make their appearance, differing from the old ones in many of their characteristics, being smaller, differently shaped, without air-cells, and with exceedingly minute roots, which are at first hidden within the leaf. Lacking the buoyancy of the summer leaves, as soon as they become detached from the parent plant, which takes place at the slightest agitation, they fall to the bottom and there remain, the original plant itself perishing with the first frost. At the proper season in the spring a small bubble of oxygen appears on the upper part of these leaves, which soon brings them to the surface of the water, from which they again descend when the temperature falls below a certain point, finally remaining at the top and developing into the mature plant.

ECONOMICAL MANUFACTURE OF OXYGEN.

We have already adverted to the employment of oxygen in ordinary illumination in the city of Paris, an application which, to be of economical value, requires an improved method of manufacturing the gas. This is done by placing 500 pounds of manganate of soda in a retort and superheating it, steam being passed over it with the result that all the oxygen is extracted in five minutes. Hot air is then passed over this residue for five minutes more, and the percentage of oxygen is again restored; and this alternation is continued to the number of six times in an hour,

at the end of which time two and a half cubic yards of oxygen have been furnished. The oxygen, as it first issues from the gasometer, contains about fifteen per cent. of nitrogen; but by allowing the first portions to escape, the quantity of this gas in the mixture can be reduced to two and a half per cent. According to the statement of the inventor of this process, one ton of manganate of soda will yield 100 cubic yards of oxygen daily, or more than 36,000 cubic yards per year, without the necessity of renewing the salt during the whole time.

NATIVE SULPHUR IN THE WEST INDIES.

A valuable deposit of native sulphur has lately been discovered in the island of Saba, of the Dutch West Indies. The deposit is found in a trachytic porphyry, and varies in thickness from fifteen to fifty feet, its elevation above the sea being from forty-five to two hundred feet.

DISCOVERY OF NATIVE LEAD.

It is stated as an interesting discovery in mineralogy that native lead has been found in Thuringia, embedded in amygdaloidal melaphyre, and running through the rock in globules and strings. This announcement has excited much skepticism among mineralogists; but the evidence of the fact is said to be quite incontestable.

GREAT HEAT FROM STEAM.

The apparent paradox of raising certain solutions, by means of steam at 212 degrees Fahrenheit, to an appreciably higher degree than this, has been presented by Mr. Spence. Thus he selects a solution of some salt (as nitrate of soda) having a high boiling-point, or one of about 250 degrees Fahrenheit, and this is placed in a vessel surrounded by a jacket. Steam is let into the intervening space until the temperature of 212 degrees is reached. The steam is then shut off and an open pipe immersed in the solution, and steam from the same source thrown directly into the liquor. In a few seconds the thermometer begins to rise slowly, but continues to do so until it finally reaches the point of 250 degrees. This method, applicable in a great variety of ways, promises to be of immense value in obtaining readily an unusually high degree of temperature, and one by means of which important chemical combinations and decompositions can be accomplished.

INFUSION OF COAL AND CHALK.

Some curious statements have lately been presented to the Microscopical Society of London, by Mr. Wake, in reference to the phenomena observed after macerating coal and other mineral substances in water. When a piece of coal is powdered as finely as possible and placed in water, it exhibits, after the lapse of a week, a curious growth, which finally assumes the form of masses of regular vegetation of a black color, bearing one or more fronds; but intermingled are fibres apparently flattened, and perfectly black, occasionally attaining great length. Other fibres are of a greenish hue, and seem to be interwoven with small black fronds. In addition to these there is a considerable quantity of a gelatinous substance which appears to exude from the coal matter; and there are small crystalloid bodies which float about freely in the wa-

ter, together with minute moving protuberances extending from various parts of the coal substance and the vegetation.

Similar experiments made with chalk revealed minute organisms of various forms; some round, others like straight or curved tubes; and occasionally small bodies resembling the so-called coccolites of the mud from the Atlantic sea-bottom. With these were certain minute moving bodies, quite similar to those found in the experiment with coal. In a little while black protuberances were projected from the larger masses, having a movement like those from the coal infusion. After a time the particles appear to have a gelatinous coating, and in the course of some weeks become great conglomerated masses, having small projections at various points, the extremities of which are occasionally seen to move, and ultimately grow larger, and their movements more perceptible. In addition to these forms numerous small detached organisms are seen to move through the fluid, having small white spots in different parts. There is also an apparent vegetable growth, in the form of long, flat, semi-translucent fibres. Still more curious is the fact stated by Mr. Wake, that similar phenomena exist in the infusion of powdered limestone, differing in detail from those of the chalk, but not so much so in their general character. Experiments prosecuted with an infusion of emery exhibited results somewhat analogous, and presenting some striking peculiarities.

The author, in his memoir, does not attempt to draw any inferences or establish any generalizations from his experiments as just recorded, not even to suggest that they may be the mere development of animal or vegetable spores floating in the atmosphere; nor how far some of the phenomena may be referable to the molecular movement of minute inorganic particles well known to microscopists. His investigations are still in progress, and will be subjected to as searching an examination as possible, in order to detect any fallacies or sources of error, and to establish the whole on a proper basis. We may say, however, that the idea that chalk contains actual living organisms, precisely identical with those which are now giving rise to the chalk formation at the bottom of the ocean, has been maintained by many naturalists, who have endeavored to prove their positions by totally different lines of reasoning.

GLACIER ACTION ABOUT NEW HAVEN.

Professor Dana has recently published an elaborate account of the geology of the vicinity of New Haven, with special reference to the origin of its topographical features; and he endeavors to show that the region in question, in the glacial era, like that of New England to the north, was largely moulded at the surface by the action of a great glacier occupying the valley of the Connecticut, and by its under-flowing streams; and that it was covered, in consequence of the subsequent melting of the ice, with stratified and unstratified drift formations simultaneously. He also endeavors to prove that icebergs, which have been assigned so important a part by some in the moulding of the surface of the country, had no part whatever in the matter, and that the supposed iceberg sea over New England had no existence.

NEW TEST FOR ARSENIC.

A new test for arsenic is said to be so successful that it will detect one part of this substance in a million parts, in solution, while the presence of antimony does not affect it at all. In applying the test the arsenic liquid is mixed with hydrochloric acid until fumes are apparent. Stannous chloride is then to be introduced, which produces a basic precipitate containing the greater part of the arsenic, as a metal, mixed with stannic oxide.

OCEAN CURRENTS.

In a recent article on ocean currents, Mr. Croll discusses the question of the influence of the Atlantic Gulf Stream in affecting the temperature of Western Europe, and takes very decided issue with those who deny its agency in that respect. He estimates the total amount of water conveyed by the Gulf Stream at a current fifty miles wide and one thousand feet deep, moving at the rate of four miles an hour, and with a mean temperature of sixty-five degrees at the moment of leaving the Gulf. During its northern journey it is calculated that it will cool down to forty degrees, losing, therefore, twenty-five degrees of heat. The total amount of heat transferred every day by the Stream amounts then to one hundred and fifty-four sextillions (154,000,000,000,000,000,000) of foot-pounds—an estimate considerably less than that made by other authors. This quantity of heat he considers to be very much greater than that carried by all the atmospheric currents that blow from the equator; and he thinks that the entire amount of heat transferred from the equatorial regions by all the ocean currents must be enormous.

While, however, insisting that the amelioration of the temperature of Western Europe is due to the Gulf Stream, he does not think that this is effected by direct radiation, but by heating the winds which blow over it toward the shore; since it is well known that in the northern hemisphere the general tendency of movements of the atmosphere is from west to east.

Our author also finds that the low temperature of the southern hemisphere is owing to the comparative absence of ocean currents, and that without any such currents at all the globe would not be habitable; since, owing to the earth's spherical form, too much heat is received at the equator, and much too little at high latitudes, to make the earth a suitable dwelling-place for the human race. Under existing circumstances, however, the excess of heat is carried by the currents from the equator toward the poles, and the counter cold currents return toward the equator, thus equalizing the temperature, and an average is kept up that answers all our material wants. Our author finally comes to the conclusion that without the existence of the Gulf Stream the mean annual temperature of Great Britain might sink below the present midwinter temperature of Siberia, for all that can be shown to the contrary.

In this connection it may be proper to state that, according to Professor Henry, the heat of the Gulf Stream is carried to Europe by its being first taken up in the vaporization of water, which, borne in an easterly direction by the winds, condenses into rain in Western Europe, and thus in so doing the heat is again given out. Such an explanation accounts equally well for the heat of

the rainy winters, both of Western Europe and of Northwestern America.

Our author, in a second article, endeavors to prove that a chief cause of the secular change of climate at different epochs may be due to the deflection of ocean currents, and that, were the Gulf Stream of the Atlantic coast turned southward, and that of the North Pacific also, the whole northern hemisphere would in a short time assume a normal condition. The climate would then probably resemble that of the glacial epoch, while the opposite hemisphere, receiving so much heat from the equator, would have a climate similar to that which prevailed in the northern hemisphere during a part of the miocene period, when North Greenland was as warm as England at the present day. The causes which, according to Mr. Croll, deflect ocean currents, and which, in his opinion, have acted at various times upon them, so as materially to affect the terrestrial atmosphere, and the changes which may occur again, after the lapse of a sufficient length of time, our limits will not permit us to indicate here; and for their explanation we must refer to the original articles, published in the *London, Edinburgh, and Dublin Physical Magazine* of 1870. We may add, however, that our author finds in the absence of southward equatorial currents of any magnitude the explanation of that peculiar condition by which the climate of the southern hemisphere is so much more rigorous than that of the northern, and by which in regions of the latitude of England the thermometer seldom rises above 42 degrees, and never above 51, while snow may fall on any day in the year.

It is rather startling to reflect that the shifting a few degrees south of its present position of the equatorial current of the Atlantic, between South America and Africa, would turn its entire stream into another direction, or that of the Brazilian branch; so that, instead of flowing chiefly into the Gulf of Mexico, as at present, it would pass into the Southern Ocean, and the Gulf Stream be stopped. This stoppage of the Gulf Stream would place Europe under a glacial condition, while the temperature of the Southern Ocean would be very greatly elevated.

RHEEA, OR CHINA GRASS.

Much attention has been directed in India toward the cultivation of the China grass, of the variety called rhea; and a large quantity has been raised in that country without its having been taken hold of to any great extent by manufacturers. The principal difficulty is understood to be the want of suitable machinery for separating the fibre and the bark from the stem, and the fibre from the bark, the expense of doing this by hand being too great for ordinary use. In view of the fact that the climate of India is especially adapted to the cultivation of this plant, the Governor-General has just announced that he has been authorized to offer a prize of \$25,000 for a machine that shall be capable of producing a ton of fibre, of a quality that shall average in value not less than \$250 per ton in the English market, at a total cost of all the processes of manufacture, and allowance for wear and tear included, of not more than \$75 per ton. This is to include all the operations performed after the cutting and transportation of the plant to the place of manufacture, and the completion of the

manufacture of the fibre of the quality prescribed. The machinery must be simple, strong, durable, and cheap, and should be suited for erection at or near the plantation, as the refuse material is said to be valuable for use as a manure for continued cultivation.

The government of India will furnish, on application through its Secretary of State, a supply of carefully dried stems and specimens of the fibre separated from the bark, to all mechanical firms desirous of competing for the reward. One year from the date of the advertisement, January 11, 1870, is allowed for the preparation of the machinery and transportation to the locality where the trial is to be made.

Both the rhea grass of India and the ramie of China are derived from varieties of the *Boehmeria tenacissima*. As "ramie," the plant has been widely diffused in North America by the National Botanic Garden and the United States Agricultural Department, and much detail respecting its culture and character will be found in the valuable publications of the latter establishment. As soon as all the problems respecting its preparation are solved it will doubtless become of great economic importance in the United States; and the reward offered by the India government might not inappropriately be supplemented by another on the part of our own authorities.

COLORING MATTER IN COAL TAR.

The tar produced in the distillation of coal for the manufacture of ordinary burning gas, at one time looked upon as mere refuse, has more recently proved of much commercial value, on account of the great variety of chemical products, especially of coloring matter, which it contains. It has been estimated that 100 pounds of the tar will furnish, on an average, 3 pounds of commercial and $1\frac{1}{2}$ pounds of pure benzole, out of which 3 pounds of commercial nitro-benzole can be obtained. These 3 pounds of nitro-benzole furnish $2\frac{1}{2}$ pounds of rosaniline; and from this, again, are obtained 3.37 pounds of the raw aniline red, out of which 1.12 pounds of pure fuchsine can be made. Since 100 pounds of coal furnish, on an average, 3 pounds of tar, it requires, therefore, about 3000 pounds to furnish 1 pound of pure fuchsine. It is estimated that all the gas-works in Europe consume annually about 160,000,000 cwt. of coal; so that the gas tar which they furnish will yield about 53,000 cwt. of fuchsine.

RENDERING WOOD FIRE-PROOF.

Among the various methods recently suggested for rendering wood practically incombustible, those of most value appear to be common salt and soluble glass, or the so-called water-glass. By using the latter substance in filling the pores of the wood, and coating its surface with a thin layer of cement, the danger from fire can be reduced almost to the minimum. For this purpose the wood is first well dried, and then allowed to remain for twenty-four hours in a solution of one part of water-glass in three parts of water, after which it is to be removed, dried for some days in the air, and then again immersed in the above-mentioned solution for twenty-four hours. After a second drying it is to be coated with a mixture of one part of fresh cement and four parts

of water-glass solution, the bath previously used being available for this latter mixture. No more cement should be mixed at one time than is to be applied immediately, as it becomes hard and can not again be dissolved. After the first coat has dried thoroughly another layer is to be put on, and finally a coating of water-glass by itself, which results in giving the wood a smooth, glassy appearance.

Should the timber be too large for immersion in the bath, it should be moistened by successive applications of the solution from a hose, care being taken to save the excess which runs off, so as to use it again. The cement may be applied by means of a coarse whitewash brush. The timber should not be planed smooth, but should be left with the rough saw cuts upon it, so as to facilitate the absorption of the liquid. The final application of the cement will give a smooth appearance, and the natural roughness of the wood will aid in its adhesion. Any cracks in the timber should be filled up thoroughly with the cement.

Timber thus prepared acquires a very solid, compact character; the original material is of comparatively little consequence. Indeed, the more porous the wood, the more readily does it become permeated by the preservative solution. Experiments have been tried with timber of greater or less thickness, prepared in this way; and the result has gone to show that it was practically incombustible, a degree of heat which would otherwise have consumed it in a very short time having no effect whatever. The author of this process, therefore, confidently recommends his method as a complete safeguard against fire; and says the cost of the application is so trifling, in comparison with the results to be obtained, that he expects before long to see it in very general use. He suggests a similar treatment of sleepers for railways, guaranteeing a durability at least ten times as great as that of wood in its natural condition.

ALBERTYPE PRINTING.

We have already given an account of the general process by which the beautiful reproductions of photographic pictures are made by the method of Albert, the lithographic stone being replaced by a polished plate of glass, upon which the photographic picture is taken, and from which the prints are made. Certain details of this "Albertyping" were for a time kept secret, so that it was difficult to imitate the results obtained by Albert; but recently a fuller account of the whole has been published.

The general advantages of the process, as summed up by the inventor, are, that as many as from five hundred to a thousand impressions can be taken from a single plate, so that the ordinary lithographic stones or metal plates can be dispensed with, and a much cheaper plate of mirror glass used in their stead, from which one picture can be removed and another readily substituted. The impressions obtained are of incomparable purity, without any grain, and of a softness in the middle tones, and with a freedom from spots and irregularities, leaving nothing to be desired.

POISONOUS COLORING OF FRUIT SIRUPS.

A note of alarm has been raised in regard to the employment of aniline dyes for coloring va-

rious liquids and fruit sirups, used extensively as beverages; and the dangerous effects likely to result from the use of such mixtures are carefully pointed out. The following are some of the methods of distinguishing between the true fruit juices and those that have been colored by any of the aniline dyes.

Genuine fruit sirups become completely deprived of their color by means of chlorine; and while aniline colors are also destroyed, a black deposit is left, which is readily recognized. Sulphuric acid, nitric acid, and hydrochloric acid render the red colors of genuine sirups brighter, and color the artificial of a yellowish orange. Caustic potash decolorizes fuchsine sirups, and changes the red fruit sirups into a dirty green. Carbonate of potash does not alter the color of artificial sirups, but changes the genuine to green. Acetate of lead produces a greenish deposit in a genuine fruit sirup, and a red one in fuchsine sirup. A similar change takes place in the gradual addition of alum and carbonate of potash. Aldehyde changes sirups colored with aniline to blue.

REMOVAL OF ORGANIC SUBSTANCES FROM WATER.

It is well known that the presence of any organic substances in water, used in the manufacture of ale or beer, is very detrimental to the quality and flavor of these beverages, and various methods have been suggested for removing them. Permanganate of potash has been employed in many instances; but a much better application is said to consist in the use of black oxide of iron. This is obtained most readily by heating powdered red hematite iron ore with saw-dust in a crucible. If impure water is allowed to percolate through a layer several inches thick of this black oxide of iron, the organic constituents will be completely neutralized. Such filters of black oxide of iron have been in use for several years without having lost their efficiency.

PROTECTION TO WALLS AND CHIMNEYS.

The decay of marble fronts and other constructions of stone into which lime or magnesia enters as a component, and of the mortar joints in brick chimneys and walls, which in many cities has become so serious a difficulty, is attributed to the continued evolution of sulphurous and sulphuric acid by the combustion of coal—each ton of the coal being capable of supplying about seventy pounds of oil of vitriol. In addition to the chemical corrosion, a mechanical disintegration is supposed to be produced by the alternating solution of the sulphates formed, and their recrystallization on the surface and in the pores of the stone. It is stated that this action can be almost entirely prevented by applying to the clean surfaces an aqueous solution of superphosphate of lime, which, acting on the carbonate of lime, produces the unalterable diphosphate of lime. For magnesian limestones baryta may be added. The cost of materials is but trifling, and one gallon of solution will give two coats to three hundred square feet of surface. The strength of the stone and its resistance to absorption of moisture are said to be greatly increased by the process, a matter of importance where the freezing of water in the pores of the stone is one cause of decay.

FLIES.

The naturalist recognizes many hundreds of kinds of flies in this country; but in our household economy we reduce them mainly to three sorts: house-flies, biting-flies, and bluebottle or blowflies. The latter is readily distinguished; the two former are frequently confounded, although easily known apart by the naturalist or an acute observer. They may, however, always be identified at a glance by the position they assume on a wall. A common house-fly almost invariably rests with its head downward, and, however it may alight, works its way round until this direction is assumed. The biting-flies, on the contrary, as universally rest with the head pointing upward, acting, in this respect, precisely like the equally blood-thirsty mosquito. The brother of an eminent Russian entomologist now residing in the United States observed a peasant in his own country killing some of the flies on a wall of his hut without disturbing others, and, on being questioned, he gave as a reason that those with the heads up were "biters," and the others were not. A careful examination of the facts by the entomologist himself proved the accuracy of the generalization thus made by an ignorant but observant man.

BISULPHITE OF LIME.

This substance is capable of some important practical applications. A fluid drachm added to a pound of spermaceti, bear's grease, old cream, lard, or other oily preparations of ointments, will cause them to remain perfectly sweet for a long time, sometimes for many months, preventing any taint or rancidity. Beef-tea and jellies, which turn sour so readily in sick-rooms or hospitals, can be kept unchanged by stirring in a few drops of the bisulphite solution to each pint. Clothing soaked in the solution, and hung up, becomes perfectly disinfected, without any disagreeable odor, as is the case when carbolic acid is employed. It can also be used in the preservation of specimens of natural history and anatomy.

NEW METHOD OF DESICCATION.

Mr. Reisehauer has devised an improved method of extracting the aqueous components of organic objects, so as to accomplish very interesting results. It consists in taking a plate of glass, ground smooth like the plate of an air-pump, and placing on it a vessel half filled with chloride of calcium, upon which ether is poured. A capsule containing the object to be desiccated is placed above the ether, and a bell glass with ground base is applied over the whole, resting on the glass plate. The ether gives up its water to the chloride of calcium, and takes it from the organic matter, until the latter becomes completely anhydrous. Certain animal substances retain their flexibility and perfection of structure in a remarkable degree, especially the skin, the intestines, the lungs, liver, etc.

NESTING-PLACE OF PENGUINS.

The large penguins of the Antarctic Ocean exhibit a curious peculiarity in the place of deposit of the single egg laid by them. This, instead of being placed in a nest, as with other birds, is held between the legs and feathers of the belly, and transported by the bird wherever it goes until hatched.

THATCHING MACHINE.

At a recent agricultural exhibition in England much interest was attracted by a multiple needle sewing-machine for making thatching. For this purpose the straw is placed upon an inclined feed board, whence it is drawn continuously through the machine, which converts it into a dense woof impervious to rain. The needles are supplied with strings, and may be adjusted for straight, curved, or zigzag lines of stitching; and as the stitches are perfectly secured, the thatch may be cut up into lengths without becoming loose. A web of five feet in width, with a thickness of three-quarters of an inch to two inches, and of any length, can be readily manufactured and applied as thatching, or for matting of rooms, walks, railroad cars, etc., having the advantage for the latter purpose, on account of the slight cost of production, of admitting renewal whenever soiled by use.

ARTIFICIAL RUBBER.

A kind of artificial India rubber is now made in Paris, which replaces true rubber in the manufacture of various articles, since it is a homogeneous and elastic substance, insoluble in oils, whether mineral or vegetable, and not attacked by hydrogen. It is used for the purpose of rendering tight, wooden vessels intended to contain petroleum, benzine, ether, etc., or in the construction of flexible tubes impervious to coal gas, in making printers' rollers, in insulating electrical wire, in galvanoplastic reproductions, in closing bottles hermetically, and many other applications. The cost is given at only about twenty-five cents per pound. The composition of this substance is not stated; but it is, in all probability, essentially a mixture of gelatine and glycerine, as these are known to have, when combined, all the properties claimed for the new artificial rubber.

REMOVAL OF HUSK FROM GRAIN.

The subject of removing the outer husk of grain by means of chemical applications continues to excite the interest of economists. A liquid well fitted for the purpose, according to Mr. Weiss, is prepared in the following manner: The general operation consists in moistening the grain with an alkaline solution, which is prepared by boiling, for one or two hours, two parts of common calcined soda in thirteen parts of water, and adding one part of quick-lime previously dissolved in three parts of water. This forms a cheap caustic soda, which is to be applied by means of a watering-pot, the mass of grain being stirred continually. Seven quarts of this solution are sufficient to remove the hull from two hundred pounds of grain, at a small cost, the liquid having the property of dilating the tissues of the exterior thin envelope of the grain which forms the pure bran, and which is then easily detached by the slightest friction. The operation does not require more than fifteen to twenty-five minutes of time, and leaves to the grain all its nutritive qualities, since the only portion removed is the dry woody hull, on the outside.

SPOTS ON THE SUN.

Our readers are all familiar with the existence of spots on the surface of the sun, and their variation in number and size from one time to

another. The existence of these spots, and the question of their periodicity, have been investigated by astronomers for some years past, and several successive periods of appearance and disappearance have been established quite satisfactorily.

The principal of these are an eleven-year period, a fifty-six-year period, a two-hundred-and-twenty-three-day period, a twenty-seven-day period, and a five-hundred-and-eighty-four-day period. Among other causes for the occurrence of these spots, and their periodicity, that of planetary disturbance has been warmly urged, although the precise connection between the position of the planets and the solar spots is not yet established. Professor Kirkwood, an eminent American astronomer, has lately published an elaborate memoir, in which, as a summary of his in-

vestigations, he states that the fact of the connection between the changes of the solar spots and the position of certain planets is unquestionable, and that a particular region of the solar surface is more susceptible than others to planetary disturbances, these occurring, as they do, between definite parallels of latitude, the number being greater in the northern than the southern hemisphere of the sun. He also announces that of the cycles of variation above mentioned, that of eleven years has been traced to the influence of Mercury; and that the marked irregularity of this period, from 1822 to 1867, is equally due to the disturbing action of Venus also; and finally, that the fifty-six-year cycle is determined by the joint action of Mercury and the earth.

Editor's Historical Record.

UNITED STATES.

OUR Record closes on April 29. The events of the month demanding attention in our summary are few. Scarcely any thing has been accomplished by Congress.—The Texas bill was finally passed March 30. The proviso was stricken out declaring that the act shall not in any manner affect the conditions and guarantees upon which the State was originally annexed and admitted. On March 31 Messrs. Hamilton and Flanigan, Senators elect from Texas, were qualified and took their seats. The delegates from that State to the House of Representatives were also duly qualified.—General Adelbert Ames, Senator elect from Mississippi, was admitted to his seat April 1.—In the House, on the 4th, a bill was passed, 114 to 40, fixing the first Monday in November as the day for electing Representatives and Delegates to Congress in all States and Territories.—On the 6th, in the House, charges were made against General O. O. Howard relative to his conduct of the Freedmen's Bureau. A resolution of investigation was ordered.—The bill declaratory of the law in regard to the income tax was passed in the Senate on the 7th. It continues for the present year the tax on salaries, dividends, and interest payable by corporations. The House, on the 23d, refused to concur in this provision, and asked for a Committee of Conference.—In the House a bill was passed on the 18th, by a vote of 86 to 83, for the apportionment of representation in the next Congress, fixing the number of members at 275, exclusive of Representatives from newly-admitted States.—The Northern Pacific Railway bill was passed in the Senate April 21.—The Georgia bill was passed in the Senate April 19 by a vote of 27 to 25. The bill, as amended, turns the State over to military rule again, and requires an election for a new Legislature in November next. It also virtually defeats the plans of the partisans of Governor Bullock to perpetuate their power. The bill was returned to the House of Representatives on the 20th, and on motion of Mr. Butler was referred to the Reconstruction Committee. A substitute by Mr. Logan, providing for an election in November, and declaring the State entitled to an immediate representation in Con-

gress, was also referred to the Reconstruction Committee.

The election of State officers in Connecticut, on the 4th, resulted in a majority of 700 votes for Mr. English, the Democratic candidate for Governor.

SOUTH AND CENTRAL AMERICA.

President Lopez, of Paraguay, was killed March 1 in a conflict between his forces and those of the Brazilian general. Mrs. Lynch, four children, and Lopez's mother and brothers were captured.

The Cuban situation presents very discouraging aspects to the insurgents. Numerous instances of surrender on the part of the latter have been reported. The most significant fact bearing upon the situation is the return of General Jordan to the United States.

EUROPE.

In Ireland there has been increased discontent, accompanied by numerous outrages against landlords and property. The passage of the Irish Force bill by the British Parliament has greatly stimulated emigration from Ireland. This Force bill—passed March 31—provides for a surveillance of the press, arbitrary arrests without warrant, and the closing of inns at sunset.—The University boat-race on the Thames, April 6, resulted in a victory for the Cambridge crew—for the first time in nine years. The race was won by a length, in 20 minutes and 30 seconds—the fastest time on record.

In our last Record we stated that on March 28 M. Ollivier, the French Premier, read to the Senate a statement of the motives for a new *Senatus Consultum*. This document is essentially a new constitution for France, through which the Emperor desires to establish his dynasty, and through which, in return, he wishes to effect liberal reforms. The following is the text of the *Senatus Consultum*:

ART. 1. The Senate shares the legislative power with the Emperor and the Lower Chamber. It has the initiative of bills; nevertheless, every financial measure must first be voted by the other House.

ART. 2. The number of Senators may be raised to two-thirds of that of the Deputies, without including

those who are members by right of that high assembly. The Emperor can not name more than twenty in each year.

ART. 3. The constituent power attributed to the Senate by Articles 31 and 32 of the constitution of January 14, 1852, ceases to exist.

ART. 4. The dispositions annexed to the present *Senatus Consultum*, which are comprised in the *Plebiscites* of December 14 and 21, 1851, and December 21 and 22, 1852, and which sprang from it, form the constitution of the empire.

ART. 5. The constitution can only be modified by the people.

CHAPTER II.—OF THE IMPERIAL DIGNITY AND THE REGENCY.

II. The imperial dignity conferred on Napoleon III. by the *Plebiscite* of November 21, 1852, is hereditary in the direct and legitimate heirs of Louis Napoleon Bonaparte, from male to male, in the order of primogeniture, and to the perpetual exclusion of women and their descendants.

III. Napoleon III., if he has no male heir, can adopt the children and legitimate descendants in the male line of the brothers of Napoleon I. The adoption is interdicted to the successors of Napoleon III. and their descendants. If, after the adoption, Napoleon III. should have any male heirs, the children so adopted can not be called to succeed him until after his legitimate successors. Such act of adoption is interdicted to the successors of Napoleon III. and their heirs.

IV. In default of a legitimate or adopted heir, are called to the throne Prince Napoleon Bonaparte and his direct heirs, natural and legitimate, from male to male by order of primogeniture, and to the perpetual exclusion of women and their descendants.

V. In default of a lawful or adopted heir of Napoleon III., and of the successors in the collateral line taking their rights from the preceding article, the people nominate the Emperor, and regulate in his family the hereditary order from male to male, to the perpetual exclusion of females and their descendants. The draft of the *Plebiscite* is successively discussed in the Senate and the Legislative Body on the proposition of the Ministers formed into council of government. Up to the moment when the election of the new Emperor is terminated, the affairs of the state are directed by the Ministers in office, forming a council of government, and deliberating by a majority of votes.

VI. The members of the family of Napoleon III., called eventually to the chance of inheriting, and their descendants of both sexes, form part of the imperial family. They can not marry without the Emperor's authorization; and their marriage without that permission entails the privation of all claim to the succession, both for the person contracting the said union and for his descendants. Nevertheless, if there should not be any issue from such marriage, in case of a dissolution caused by decease, the prince who has contracted it recovers his right of succession. The Emperor fixes the titles and conditions of the various other members of the family; he has full authority over them, and regulates their duties and rights by statutes.

VII. The regency of the empire is regulated by the *Senatus Consultum* of July 17, 1856. However, in cases provided for by paragraph three of article five, the Legislative Body is convoked at the same time as the Senate. In the case foreseen in the paragraph which follows the votes of the Legislative Body co-operate with those of the Senate in the election of Regent.

VIII. The members of the imperial family, called eventually to the succession, take the title of French princes. The eldest son of the Emperor takes the title of Prince Imperial.

IX. The French princes are members of the Senate and of the Council of State when they have attained the age of eighteen years completed; but they can not sit in them without the consent of the Emperor.

CHAPTER III.—FORM OF THE EMPEROR'S GOVERNMENT.

X. The Emperor governs with the aid of the Ministers, the Senate, the Legislative Body, and the Council of State.

XI. The legislative power is exercised collectively by the Emperor, the Senate, and the Legislative Body.

XII. The initiative of laws belongs to the Emperor, the Senate, and the Legislative Body. Nevertheless, every bill imposing a tax must first be voted by the Lower Chamber.

CHAPTER IV.—OF THE EMPEROR.

XIII. The Emperor is responsible to the French people, to whom he has always a right to make an appeal.

XIV. The Emperor is the Chief of the State. He commands the land and sea forces, declares war, contracts treaties of peace, alliance, and commerce, nominates to all posts, and fixes the regulations and decrees necessary for the execution of the laws.

XV. Justice is administered in his name.

XVI. He has the right to grant pardons and to accord amnesties.

XVII. He sanctions and promulgates the laws.

XVIII. The modifications to be hereafter made in the laws, customs' tariffs, or postal charges by international treaties, will only be obligatory after having been voted by the Chambers.

XIX. The Ministers depend only on the Emperor. (Reproduction of the *Plebiscite*.) They deliberate in council, with his Majesty presiding, and are responsible.

XX. The Ministers can be members either of the Senate or the Legislative Body. They can enter either assembly when they please, and have a right to be heard whenever they think proper to speak.

XXI. The Ministers, Senators, Deputies, persons composing the Council of State, officers of the army and navy, judges and public functionaries, are to take the following oath: I swear obedience to the constitution and fidelity to the Emperor.

XXII. The *Senatus Consulta* of the 12th of December, 1852, and 23d of April, 1856, relative to the civil list, remain in force. In future the allowance to the Crown shall be fixed for the whole duration of the reign by the Legislature which meets after the Emperor's accession.

CHAPTER VI.—OF THE LEGISLATIVE BODY.

XXVIII. The basis of election is the population.

XXIX. The Deputies are returned by universal suffrage, and are to be voted for individually.

XXX. They will be chosen for a period which can not be less than three years.

XXXI. The Lower Chamber discusses and votes laws and taxes.

XXXII. It chooses, at the commencement of each session, its President, Vice-Presidents, and Secretaries.

XXXIII. The Emperor convokes, adjourns, prorogues, and dissolves the Chamber. In the latter case his Majesty is bound to summon a new one within six months.

XXXIV. The sittings are public, but at the request of five members they can be held in secret.

CHAPTER VII.—OF THE COUNCIL OF STATE.

XXXV. The Council of State is charged, under the direction of the Emperor, to draw up the bills and regulations of the public administration, and to solve any difficulties that may arise in the conduct of affairs.

XXXVI. It sustains, in the name of the government, the discussion of bills in the Senate and Legislative Body.

XXXVII. The Ministers hold rank in the Council of State, and have a right to sit there and vote.

CHAPTER VIII.—GENERAL PROVISIONS.

XXXVIII. Petitions can be presented either to the Senate or the Legislative Body.

The reforms here proposed were to be submitted to the vote of the people on the 8th of May in the form of a *Plebiscitum*. Opportunities were granted for free discussion of the new Constitution in public assemblies held between April 23 and May 3. The army was allowed to vote on this occasion. The Emperor's measures have excited much disaffection among the "irreconcilables." M. Buffet early in the month, and Count Daru about the middle of April, resigned their positions in the Cabinet. Still, in the Corps Législatif the government was supported by a vote of confidence, 227 to 43. On the 13th this Chamber adjourned until May 9. The debate on the *Plebiscitum* was closed in the Senate on April 19. Both the Emperor in his proclamation to the people, and the Premier in his official declarations, pronounce the result of this election to be the decision of the French people between order and anarchy—between a stable government and revolution.

Editor's Drawer.

THE Drawer has had frequent occasion to quote the abundant wisdom contained in some of the quaint and mirth-provoking sayings of Henry Ward Beecher. Our last sermon, it may be remembered, was "on to the memory of a bad young man—one of the *wust* that in the onscrutable ways of the divine peppusses was ever permitted *toe* locate in New Hampshire." One of Mr. Beecher's last written sermonettes is on Sobriety, and his view of that virtue may be gathered from a few sentences.

"Every man," says he, "should be sober sometimes. I once knew one so unfortunate as to be sober all the time, *and yet an honest man!* We have known men that never smiled, or seldom, whose face was as rigid as an iron mask, and yet they were kind, simple, and *really reliable*. But such are exceptional cases. Uniform sobriety is presumptively very much against a man. He who gives no play to the gentler feelings has something the matter with him that should be looked into before one trusts him far.

"Mirth itself is not always honest. But it tends to openness, to sincerity, to sweetness. Mirth has better stuff in it to make a man of than sobriety has. It, too, is used sometimes as a mask for hypocrisy, but not half so often as sobriety is.

"Only consider how many men quite empty and worthless, inwardly neither rich nor forceful, are kept agoing by the mere trick of gravity. *When some men come to you it is like sunrise.* Every thing seems to take new life, and shines. Other men bring night with them. The chill shadow of their sobriety falls upon every innocent gayety, and your feelings, like birds at evening, stop singing and go to roost. Away with these fellows who go owling through life, all the while passing for birds of paradise! He that can not laugh and be gay should look well to himself. *He should fast and pray until his face breaks forth into light.*

"Here, too, are the immortal dullards who, it is to be feared, will never forsake the earth. Dull good men! They live with the uniform consistency of stagnation. They are said to be reliable. You always know where to find them. Safe men they are. They are none of your high-flyers, never extravagant, always where you found them last! Over their blessed faces hangs the twilight of sobriety. They are immense negatives. Nothing saves them from pity but their sobriety. Men worship that; and so dullness passes for consistent piety.

"Behind the mask of sobriety how many pretenders pass themselves off! Every one knows how wretchedly inconsistent with honor their outdoor life is, but they have such a power of gloom in meetings that men respect their religious experience! And so the young are taught that one can be eminently religious without being strictly honest or reliable.

"Public sentiment is purifying itself. Men are beginning at last to understand that nothing is so cheerful, so full of liberty, so genial and joyous, as true religion. Christ called this sort of men children of Light. He ridiculed and denounced the long-faced hypocrites who ostenta-

tiously prayed and prayed, and got further from grace and humanity the longer they prayed. After Him came the apostles, who cry out to *all good and true men*, 'Rejoice in the Lord alway, and again I say, *Rejoice.*'"

A LITTLE triangular piece of legal wit was perpetrated in the clerk's office of the Supreme Court of the United States, at Washington, on "All-fools' Day," between a distinguished Senator from Wisconsin, Mr. Middleton, the clerk, and the able and witty ex-Attorney-General of the United States, from New York.

"Mr. Middleton," said Senator Carpenter, "there is no statute of the United States that prohibits a man from making a fool of himself?"

"Nor any *decision* of this court," gravely rejoined the clerk.

"And certainly," quickly added Mr. Evarts, with a sly twinkle of the eye, "there is nothing in the *practice* of this court to warrant any other conclusion."

A LITTLE story is told of President Woods, of Bowdoin College, in connection with the large painting in the college chapel, representing the conflict between Michael and the Dragon, in which the angel is supposed to be getting the upper hand of his disagreeable adversary. As the artist was desirous of completing the picture before Commencement week, but could not accomplish it without working on the intervening Sunday, he applied to the President, and asked permission to paint on that day, stating the circumstances under which he was placed, and deeming them a justification. President Woods, in his wonted dignity of manner and in his inimitable style, replied, "Well, Sir, I don't know as there is any objection; but" (looking over his spectacles, and hesitating a moment), "don't you think that it might look as though the Dragon was getting the better of Michael?" The picture does rather warrant the conjecture that Michael was not making a perfect job of it.

HERE is a neat epigram that sprang up in some drawing-room of sixty years ago. It is probably English, but it has a suspicious French ring about it:

"I've lost my mistress, horse, and wife;
And, when I think on human life,
It's well that it's no worse.
My mistress had grown lean and old;
My wife was ugly and a scold;
I'm sorry for my horse."

A FEW days before the adjournment of the last session of the Legislature of North Carolina, a wealthy conservative from a distant portion of the State, happening to be in Raleigh, paid a visit to the capitol. Taking a seat in the lobby of the Senate chamber, he meditated on the degeneracy of the times which permits colored men to hold seats in that body. He was roused from his reverie by a colored Senator, who arose, and in the course of his remarks used the familiar quotation from the 137th Psalm, "Let my right hand forget her cunning," etc. He could contain himself no longer, and, turning to a friend,

said: "Isn't it disgusting to hear such an ignoramus attempting to quote Shakspeare?"

FEW men are better remembered in Michigan than the late Rufus Hosmer, for many years editor of the *Detroit Advertiser*. He left unpublished many anecdotes of the "Early Bar of Michigan," which are quite worthy of being preserved in book form. We are permitted by an editorial friend at Lansing to publish the following:

ORNAMENTED GROUNDS.—Parks, a good-natured member of the Oakland bar, and not lacking in ability, entered the profession late in life, and at first was not very successful. One Saturday, at the close of a term in which he had been particularly unsuccessful, he had taken up his file of papers, and in a pet had written on the back: "All gone to h—!"

Judge Whipple's attention was called thereto by Hanscom, who pleasantly remarked:

"It is always a handsome sight to see *Parks well laid out!*"

A FAMILY SUITOR.—A very pretty Oakland girl, not over eighteen years of age, brought a suit for breach of promise against a young merchant, who had changed his mind and taken a richer bride.

The trial came on, and the girl's mother, a fat, red-faced old dame, was present in the bar, to give moral effect to the recital of her daughter's wrongs.

The counsel for the plaintiff, in summing up, descanted at length and with moving pathos upon "the enormity of the defendant's guilt in creeping into the bosom of this family" (here the old lady pinned her shawl closer), "and deceiving and disappointing this fair girl!"

Here the venerable mother could contain herself no longer, but with gushing tears exclaimed:

"He deceived us all, gentlemen! Me and all the rest—me and all the rest!"

The effect was magical, but not just what the old lady expected.

THREESCORE YEARS AND TEN.—Old Sile Doty, of Hillsdale County—that most notorious evil-doer, thief, receiver of stolen goods, burglar, and every thing else bad—was arraigned before Judge Pratt (afterward of Honolulu) for horse-stealing. As usual, a clear case was proved against him, and he was brought up for sentence.

Pratt was abrupt in manner, rough in tone, and severe in expression. These traits were rather enhanced than mollified upon this occasion. He broke out with, "Stand up, prisoner at the bar. Prisoner, how old are you?"

"Fifty-three years, five months, and twenty days," was the reply.

The Judge took out his pencil and figured for a moment; then said:

"Prisoner, I sentence you to hard labor in the State prison for sixteen years, six months, and ten days. This brings you to seventy years, beyond which my jurisdiction don't extend. Sheriff, remove the prisoner!"

CRIME NECESSARY IN A NEW COUNTRY.—A mild and lenient man was old Judge —, one of the earliest magistrates of Oakland under the first county judge system enacted by the Gov-

ernor and judges. He had some peculiarities which might remind one of Dicky Riker, the famous Recorder of New York, save that Dicky grew more and more severe, and the Oakland judge more and more forgiving, as age came upon them. Yet had they points of analogy, in that each used a certain rigmarole as a sort of peroration preceding the sentence passed upon a culprit. But mark the difference:

Dickey used to say, when the prisoner was before him for sentence—no matter what the crime, even if it was eating his great-grandfather's head off—

"Prisoner, stand up. The crime of which you have been convicted is becoming very prevalent in this community, and must be put a stop to! I give you five years."

Not so the sword-and-scale bearer of Oakland. His formula of conscience and duty was different, though not less uniform—thus:

"Prisoner, hold up your hand. You have been found guilty of [larceny, assault and battery, trespass, as the case might be]. But the Court takes into consideration that this is a new country. Society is unsettled, nor are the laws understood. We must expect such things in settling a new country. So I give you thirty days."

On one occasion a man was arraigned for willful perjury. He had property and standing, but the case was so clear that the jury pronounced him "guilty" without leaving their seats.

The prosecuting attorney was in ecstasies over what all criminal lawyers consider no small exploit—the recovery of a verdict of guilty on an indictment for perjury.

The prisoner being brought up for sentence, the Judge commenced:

"You have been convicted of *perjury*, prisoner. This is a grave offense; but I consider that this is a new country, and we must have *some perjury* among the difficulties of settling a new country. So I shall only give you thirty days in the county jail."

The prosecuting attorney, to wind up a case of false swearing, went outside the court-house and gave vent to a large volume of the genuine article.

AN indignant gentleman of Bangor, Maine, sends the following rasping criticism, accompanied with an anecdote:

You have a habit there in New York, and elsewhere, of saying what is done "*down* in Maine." Please inform us where your authority is for that form of expression, when history, geography, geology, and every authority worthy of regard, puts Maine *up*. Didn't John Cabot discover Maine before New York was thought of? Isn't Maine head and shoulders above every other Atlantic State—on the map? Weren't her foundations laid before those of any other state in the world? And don't the sun greet her every morning before any other American State is awake? We do not admit metropolitan authority; that don't go down in this republic. We know that Maine leads the United States galaxy—that it is the East, the Orient, and lord! We don't care what you call us, so long as we know that we are any thing but *down*.

The above introduction was occasioned by your publication of an anecdote in the April

Drawer beginning "Down in Maine." Now, I have a story about a judge that begins differently:

In that part of our country which is greeted by the first rays of the morning sun, the intercourse between judges and criminals seems, now and then, to be of that pleasant, colloquial sort that might be emulated with advantage elsewhere. An offender who, in either Byzantium or Salt Lake City, would have been deemed virtuous, so far as his crime was concerned, was brought before a model judge for sentence. On being asked what he had to say why sentence should not be passed upon him, he commenced a speech in indistinct tones, and was directed to come nearer to the Court. Leaving his dock, and placing himself directly under the droppings of the judicial sanctuary, he said:

"Oh, Judge, mercy! I am an old man—"

"How old?" abruptly inquired the judge, who is something more than a sexagenarian.

"Fifty-six."

"That's not old. Go on."

"Oh, Judge, be merciful! I am innocent. My wife left me. I wanted a home—wanted to be comfortable. My wife would not return. This woman came. I thought she would make me comfortable. I had no wife. I married her. Oh, righteous Judge, I meant no wrong! I did it innocently. A short time more in jail will be ample punishment. Oh, Judge, be merciful!" The judge is a humorist. With a sly twinkle of the eye he inquired:

"You have served one or two terms in State prison?"

"Yes, oh, Judge!"

"You would like a home, and to be comfortable. You have acquaintances in Thomaston. You can not be comfortable in this dark, dreary jail, with nothing to do. In Thomaston you will have business enough to occupy your attention. You do not want to be idle. Take my advice and go down to Thomaston, and see your old acquaintances and keep yourself employed for eighteen months, and you will be as comfortable as I can make you!"

The "pleasant" and "colloquial" manner in which this was said seemed to satisfy the prisoner that the judge knew what was best for him, and had done him a service. He went back to the dock apparently relieved, and is now making himself "comfortable" in the State prison.

So justice is administered in the American Orient. The public is protected, and bigamists are made "comfortable" without wives. Your New York robbers of the Bowdoinham Bank, however, are not so "comfortable" in that "home."

In good old times, when the youthful mind received its impression of Maine from the representation, in "Parley's Geography for Children," of a Penobscot chief, adorned with feathers, war-paint, and tomahawk, monarch of all he surveyed, among the shingles of Bangor, a trial for murder occurred in that city, wherein one of the aborigines was the most important witness for the prosecution. On the preliminary examination whether he comprehended the nature and effect of an oath the wild child of the forest seemed a little confused. Able counsel in vain endeavored to extort a sense of his responsibility. The venerable Chief Justice interposed, and, with that so-

lemnity of manner which was always impressive, he inquired of the witness as follows: "*Peol Sabattis, do you believe that if a man dies he shall live again?*" "Not by d—d sight," was the profane reply. "Indian no die but once; once dead, always dead!" It is hardly necessary to add that Peol's testimony was not received.

BROTHER N—, a highly respectable member of the legal profession in an adjoining county, was always sound in matters of law, but never particularly brilliant in the presence of that great palladium of American liberty and umbrella of our rights sometimes called a jury. On one occasion his exordium in a criminal case rather detracted from his influence. "Coming from all parts of the county as you do, gentlemen, and acquainted with all kinds of rascality as all of you undoubtedly are" (here the foreman smiled), "and especially you, Mr. Foreman, I doubt if a case of equal atrocity to this ever was within your experience!"

"I do not ask you, gentlemen of the jury," said an unfledged member of the bar, "to go back with me through the immeasurable vista of by-gone centuries and examine the explorations and resources of science; I do not ask you to accompany the astronomer into the starry firmament, or to discover the secrets of creation! No, gentlemen, I want nothing of that! I only ask you to start with me from the county jail, and travel two miles and a half on the road toward Belmont Corner!"

SPECIAL pleading has been long abolished in the New England States, and replications, rejoinders, rebutters, and surrebutters have fallen into disuse. When they obtained, it was once alleged, in the pleadings of a case brought upon a marine policy of insurance, that the vessel was wrecked and totally lost *by the act of God*, and through no fault of the owners or persons on board. The opposite attorney "traversed" in rejoinder, "that whereas, in truth and in fact, the said loss was not the act of the SAID God, but occasioned solely by the barratrous and fraudulent course of the master!"

MR. A—, of F—, was a joker. He once represented his town in the Legislature, and on his way to the capital stopped to dine at an hotel. On putting on his coat to start he had much difficulty in working into it. Some one remarked that the tailor had given him a tight fit. "Oh," said he, "the tailor did well enough, but the last Representative from our town was a good deal smaller than I am!" It appears that they had a legislative coat in F—, which each Representative filled in turn. When A— was nominated they forgot his rotundity of person.

MENTION has already been made in the Drawer of the man who, like Esau, "sold his birth-right for a mess of *potash*;" but "it has not been for this honorable court," in the language of Sergeant Buzfuz, to place upon record the stump-speaker who hoped to see all his political enemies "hanged upon a gallows higher than *Harriman*!"

At sea, time, instead of being reckoned by hours, is divided into watches of four hours each.

From four o'clock to six, and from six to eight, there are half divisions, nautically termed "dog-watches." In an insurance case, the counsel asked an old salt "at what time of day a certain collision occurred." His reply was, "About the middle of the first dog-watch." The learned barrister caught at the idea, and in summing up enlarged upon it somewhat as follows: "You can imagine, gentlemen of the jury, the care which existed on the occasion, when, as appears from the plaintiff's own witnesses, this valuable ship and her cargo, and the lives of passengers and crew, were intrusted to what, gentlemen?—why, to the mere watch of a dog!"

As illustrating the manner in which the true New England Yankee always evades being "cornered," Arthur Gilman tells a capital story of a Yankee schoolmaster who was always bragging about the United States. In conversation with an Englishman he said, "We can lick you right smart. We've allus done it, and we can do it again. At Lexington, Concord, Saratoga, Bunker Hill, and lots of them places, we give you fits."

"Yes," said the Englishman, "I do remember those places; but then there was the battle of White Plains [at which the Americans suffered a severe defeat, and were much disheartened]. We rather beat you there."

"Wa'al, you did. I forgot all about that. I shouldn't have thought of it if you hadn't a-spoke of it. But then, you see, at that battle the Americans somehow *didn't seem to take any interest in the fight!*"

"THE counsel for the plaintiff," said a gay and festive attorney of the Superior Court, "has been somewhat discursive in his remarks to you. He has alluded to almost every thing in the pages of history, ancient and modern. He has socked with old Socrates, roamed with old Romulus, ripped with old Euripides, and canted with old Cantharides. But, gentlemen of the jury, what has that got to do with this case? All his allegations are false, and the old alligator knows it himself. My client don't need any of this fine talk. Look at him, gentlemen, and say, if you can, that he hasn't done the honest thing by the plaintiff! From his youth up he has been as you now find him—A No. 1, extra inspected, scaled and screened, copper-fastened, free from scoots, silver-steel, buck-horn handle, nine yards to the dollar, thread thrown in!"

"BROTHER JONES," said a Western judge to a counselor who was employing his eloquence in behalf of a criminal, "you are misquoting the law to the jury." "I don't care any thing about the law, your Honor," was the reply; "but if you want to talk justice, *I'll go you blind!*"

THE eighth day of April was rendered noteworthy hereabout by three great occurrences: The funeral of General Thomas; the hanging of Jack Reynolds, the man who said "hanging for murder was played out in New York;" and the grand celebration of the colored population on account of the passage of the Fifteenth Amendment. Noticing the flags on the City Hall at Brooklyn draped in mourning and hanging at half-mast, a gentleman, who was not aware that the funeral of General Thomas was to take place

on that day, asked a friend whom he met what the display meant. The friend—one of the kind who says his best things on the spur of the moment—stopped, looked up, and with an air of bewilderment answered: "*I don't know; guess the flags must be in mourning for the passage of the Fifteenth Amendment, or else for the hanging of Jack Reynolds!*" Rather hard on the Common Council who control the Brooklyn City Hall.

SIN continues to pervade certain parts of Iowa, though vigorous efforts are made to extirpate it. A praiseworthy effort in that direction was made recently in one of the enterprising towns of that State. A prominent banker, noted for exacting more than legal "usance" on loans, was active at a revival, and, while wrestling in prayer, besought the Lord to humble the rebellious spirits of sinners, that they might take *more interest* in serious things. "Yes," remarked an unawakened citizen, "three per cent. a month, with real estate 'collats.'" Every body in meetin' seemed to know what was meant.

THE only good, so far, that has been evolved in the discussion of the proposition to remove the national capital from Washington to some juvenile city of the West has been to provoke a little fun. It seems, to the Drawer, that the only really correct and impregnable view of the matter is the view taken by the Hon. J. A. Johnson, of California, who exploits the idea that the true locality for a capital is in California. "A long time ago," he admits, "Washington city was a name that could not be pronounced without kindling emotions of patriotism, whereas now it suggests only a great ragged picture of negro processions, election riots, and a lobby of white speculators who could not be satisfied by a legislative donation of the whole world, unless it was tendered with a vote of thanks." He proposes, therefore, the Pacific, where pacification may be found in the soil, the air, the fruits and the juices, the ledges and the placers. "Let us go," he says, "and locate the capital at 'Red Dog,' among the breezy pines, whose long, slanting shadows fall with witchery to charm upon the surrounding hills; where the mountain streams babble music to the glass-slippered fairies, and invite the 'howling coyote' to lap of their waters. If this grand site, seated in a saddle in the mountains, pleases not your fancy, then 'You Bet' is a fitting place. No hostile fleet can ever there ascend. 'You Bet' is too high. 'You Bet,' our future capital, can never be shaken by mortal foe. 'You Bet,' our capital, is above tide-water. But if you like it not, 'Yuba Dam' is a favorable place. But, still further and last, if you will accept none of these for safety or for beauty, then 'Jackass Gulch' is an appropriate place; there every ass can bray 'with none to molest or make him afraid.'

"Moreover, 'Red Dog' is a name implying fervent domestic attachment, and should bring 'fond memories of the past' to the mind of every truly loyal gentleman present. 'You Bet' implies genial good-humor, affability of manners, and a carelessness in financial matters equal to that of the cabinet officers who footed up the estimates for our appropriations. 'You Bet,' as a place of safety from a warlike foe, has no equal on this continent. Had Troy been 'You Bet,'

'you bet' it would be standing to this day, and Hector would be driving the 'turn out' of Achilles through its streets.

"But why take time to present the advantages of 'Red Dog,' 'You Bet,' and 'Yuba Dam,' when 'Jackass Gulch' can hardly meet with opposition? Jack is a jolly fellow; ass is the superlative, stentorian, verbose orator; gulch means a nice shady place, with rippling waters, where gold may be found. Who could wish for more—jolly fellows, long thundering speeches, plenty of money, and lying in the shade? No leave to print there; every gentleman could speak his well-digested piece in peace. He of the true Bashan thunder could roar and make his tale ring about your ears to his heart's content. There we should have no infamous measures in an infamous Congress to bring us to disgrace. On the contrary, we should be as innocent children tickled with the funny prattle of the cooing daws. There 'Shoo, Fly' must forever remain a meaningless hymn to the Congo gods. There the thick hide of the rhinoceros need never ridge itself in puckers, flicker, or flinch in fear of the little stingers that play and dance and sing in the speaking rays of the setting sun."

THESE news-boys—what persistent little fellows they are! Coming down town on an Eighth Avenue car last week, one of them rushed in, with "Sun, Sir?—have a Sun?—ere's the Sun;" and coming up to fat, elderly woman, with large basket on lap, bound for Washington Market, "Have a Sun, ma'am?" "No, I should think not," replied the pinguid female; "I've got six now, and they're enough to bother the life out of a body!" Their occupation is to "shine (em up) for all."

CHILDREN are born in Titusville, Pennsylvania, in the same general sort of way in which they are born elsewhere. Occasionally there is an exception. A little stranger recently slipped into the world in that oleaginous locality, quite to the surprise of a youthful brother, whose pertinacious interrogatories as to whence came he were answered, "from heaven." This quite staggered his comprehension; nevertheless, he accepted the statement as true, "For," said he, "the reason why he looks so red is 'cause he was almost froze when papa let him in last night." Upon the nurse going into the room for something, Rolla stopped her with, "Hush! don't go in there, 'cause baby's sound asleep, gettin' rested from his long journey from heaven." A few days later a neighbor, calling to see the "episode," remarked to Rolla that the baby was a girl. This he stoutly denied. Upon being told that it wore dresses like a girl, and would undoubtedly grow up to be a woman instead of a man, Rolla cut short further argument by saying, "Well, he's a boy now, and I don't b'lieve he'll ever change!"

To pretend that nothing can be successfully done in South Natick, Massachusetts, but to compose boots and shoes is an error. The true poetical afflatus breaks out there at times, as may be inferred from the following rhythmic tribute to two promising members of the South Natick Unitarian Sunday-school, who departed this life during the past year. They were read at the

Christmas Festival. We copy from the Natick *Bulletin* of January 15:

IN MEMORIAM.

Two bright, joyous spirits that were with us last year,
To-night in our ranks do not reappear;
A tribute of love o'er their graves we would pour,
With no feeling they're lost—but just gone before.

The day had been dark, and misty, and drear,
Without all was gloom—within, little cheer;
At midnight I turned toward heaven my gaze,
Two stars there appear'd with refulgent rays:
Then there came to my ear a murmuring surge,
A melody soft—with no plaint like a dirge,
But clear notes of joy were wafted along,
And in vain did I try to catch the sweet song;
'Twas only the echo, so seraphic and clear,
That just for that moment burst then on my ear;
No forms did I see—still the music grew sweeter,
I thought in my vision—it was Carrie and Peter.

LONGFELLOW'S "Excelsior" seems destined to have as many "translators" as the Iliad. In the Drawer for October last we gave a Japanese rendering, illustrated. We have now the satisfaction of presenting one written from the Irish point of view, by Mr. Pat Rick, who deems himself to have been specially inspired for this effort:

PADDY'S VERSION OF "EXCELSIOR."

'Twas growing dark so terrible fasht,
Whin through a town up the mountain there pashed
A broth of a boy, to his neck in the shnow.
As he walked, his shillalah he swung to and fro,
Saying, it's up till the top I'm bound for to go,
Be jabbers!

He looked mortal sad, and his eyes was as bright
As a fire of turf on a cowl'd winther night,
And divil a word that he said could ye tell
As he opened his mouth and let out a yell,
It's up till the top of the mountain I'll go,
Onless covered up wid this bothersome shnow,
Be jabbers!

Through the windows he saw, as he thraveled along,
The light of the candles and fires so warm;
But a big chunk of ice hung over his head.
Wid a shnival and groan, by St. Patrick! he said,
It's up till the very tip-top I will rush,
And then if it falls it's not meself it'll crush,
Be jabbers!

Whist a bit! said an owld man, whose head was as white
As the shnow that fell down on that miserable night;
Shure ye'll fall in the wather, me bit of a lad,
For the night is so dark and the walkin' is bad.
Bedad! he'd not lish to a word that was said,
But he'd go till the top if he wint on his head,
Be jabbers!

A bright, buxom young girl, such as like to be kissed,
Axed him wadn't he shtop, and how could he resist?
So, snapping his fingers and winking his eye,
While shmilin' upon her, he made this reply—
Faith I meant to kape on till I got to the top,
But as yer shwate self has axed me I may as well shtop,
Be jabbers!

He shtopped all night and he shtopped all day,
And ye musn't be axing whin he did go away;
For woul'dn't he be a bastely gossoon
To be lavin' his darlin' in the shwate honey-moon?
Whin the owld man has paraties enough and to spare,
Shure he moight as well shtay if he's comfortable there,
Be jabbers!

A LYNN (Massachusetts) correspondent, who occasionally figures in the Drawer, mentions a little incident of D. F—— and Bob G——. The latter had applied for admission to an orthodox church. His occupation was that of a cobbler, and an indifferent cobbler he was, at that. After church F—— beckoned one of the deacons across the street, and said, "Well, Deacon, Bob G—— wants to join our meetin'."

"Yes; do you know any thing against him?"

"Well, no; but, before you take a final vote on him, *I'd just like to show you a job of cobbling he did for me; that's all.*"

IN one of those fat little places in Ohio that they call a city, the pastor of the — church came to the conclusion that he had a call to another field of labor, and resigned his pastorate. Deacon R—— was very sorry to lose his good shepherd, but, with an eye to the spiritual interests of the church, began, with others, to cast about for a successor. An eligible man having been found, the deacon was anxious that he should at once have an opportunity of exhibiting his powers before the congregation. But there was this difficulty in the way: the old pastor's resignation had been set for several weeks in the future, and he was still occupying the pulpit. Deacon R—— having doubts as to the delicacy and propriety of thrusting a new candidate in before the old one had taken his departure, took the only proper course—went directly to the pastor and stated the case. "Well, I don't know about this," said the latter; "I don't altogether like it. It's too much like 'getting on with the new love before you're off with the old.' It's not usual for a man to commence courting a new wife before his old one is buried, is it?" "No," replied the deacon, "I don't know as it is; and it ain't *very* usual for a corpse to be lying round in this way six weeks after death!"

PREBENDARY JACKSON'S new book, "Curiosities of the Pulpit and Pulpit Literature," contains several neat anecdotes of old and new time clergymen. Of Father Maimbourg, a well-known Jesuit of the seventeenth century, who once preached during the whole of Lent in a town where he was not once invited to partake a morsel of dinner, he said, in his farewell sermon: "I have preached against every vice except that of too much attachment to the pleasures of the table. This vice is by no means prevalent in a single person whom I address, and therefore I need not denounce it."

THE preachers of the seventeenth century were noted for consuming much time by trifling historical statements, something like that of Urban Chevreau, who gravely informed the readers of his "History of the World" that it was created the 6th of September, on a Friday, a little after four o'clock in the afternoon.

Bishop Burnet, in the "History of his Own Times," mentions a Dr. Case, who wrote a book with this title: "The Angelical Guide; showing Men and Women their Lot and Chance in this Elementary Life." The work is very astrological and very profound. For instance, the author states that "Adam was created in that pleasant place called Paradise, about the year before Christ 4002—viz., on April 24, at twelve o'clock at midnight." Nothing like accuracy!

THE titles of some seventeenth and eighteenth century sermons were strange, and to modern apprehension comical and irreverent: "Baruch's Sore Gently Opened, and the Salve Skillfully Applied." "The Church's Bowel Complaint." "The Snuffers of Divine Love." "The Spiritual Mustard Pot, to Make the Soul Sneeze with Devotion." "A Pack of Cards to Win Christ."

"A Spiritual Spicerie; containing Sundrie sweet Tractates of Devotion and Piety," written by Richard Braithwaite in 1638. "The Divine Lanthorne," 1686. "Cuckoldom's Glory; or, the Horns of the Righteous Exalted," with an emblematical engraved frontispiece. "Crumbs of Comfort for Chickens of Grace." "A Funeral Handkerchief, to which are added," etc., 1691. "A Divine Balance to weigh Religious Fasts in," 1643. "Leap Year Lectures: a Collection of Discourses delivered on the 29th of February to a Select Society; committed to the Press, because improper for the Pulpit," 1777. And last, not least, this: "Some fine Biscuits baked in the Oven of Charity, carefully conserved for the Chickens of the Church, the Sparrows of the Spirit, and the sweet Swallows of Salvation."

JUDGE DALY, who sits as presiding Justice of the Court of Common Pleas in New York city, is a lawyer of rare culture, a gentleman of dignity and grace, and a handsome, stern-visaged man. He is withal a man of much humor, and is said to have told about himself this story, which will be better understood when it is premised that his court has always had the reputation of "taking things easy," and its judges of not being over-particular to be in court any too promptly at the hour of opening.

"One morning," says Judge Daly, "I was coming into court a little late, when I heard one man standing at a little distance say to another (he may have been a witness anxious to get away, or a juror zealously desirous to get to work, or perhaps a client weary of the law's delay, but whatever else he was, he was certainly an Irishman), '*Och, sure there comes his Honor at last! Be jabers, Judge De-lay, yer rightly named!*'"

THREE colored men, formerly "drivers" of two wealthy planters, now rent and cultivate the plantations on Hilton Head which used to belong to those gentlemen. They run their plows, have their contract laborers, keep nice boats, buggies, and horses, and are well dressed and hospitable. On a bright day in July Cuffee Stuart's old master dropped in on him and claimed his hospitality. "Well, Cuffee," said the old gentleman, "I've come to see how you get on." "All right, Sir!" exclaimed his quondam slave; "I'll give you the best the island affords." To use a trite saying, Cuffee's table groaned under the load of venison, fish, and oysters, besides vegetables, rice, and melons. Moreover, there was a bottle of "old Bourbon," which diffused a glow of satisfaction through the old planter's stomach. On rising to leave, Cuffee pressed half a dozen cigars on his guest, which were pocketed with this courteous remark: "I'll be —, Cuffee, old fellow, if I don't believe I've got to h— before my time; for here you're living on venison and 'old Bourbon,' and I have to eat my hominy dry, out of a borrowed pot, with an old iron spoon."

A CITIZEN of Massachusetts, learning, during a temporary absence from home, that a somewhat prominent but very unpopular fellow-townsmen had been struck with paralysis, did not seem very sad at the intelligence. "Why," said his informant, "he is half dead." "Well," was the reply, "*that is better than nothing!*"

THE VAUDOIS.

VAUDOIS BURNED ALIVE IN PAIRS.

THREE valleys of singular interest open from the higher Alps into the rich plains of Piedmont below. Through each a rapid stream or mountain torrent, fed by perpetual snows and glaciers, rushes with a varying current, and mingles at length with the stately Po.¹ Two of the vales, Lucerna and Perouse, widen as they descend from the crags above, and melt into the general softness of the Italian scene. Lucerna, the most fertile, the most beautiful, possesses unrivaled charms. Its thick and almost perpetual foliage, its groves of mulberry-trees, its woods of chestnut, the waving fields of wheat, its vineyards climbing up the mountain-side, its temperate air, its countless hamlets, its innocent and happy people, seem to rest in per-

fect peace beneath the shelter of the encircling Alps. It would indeed be a paradise, exclaimed the historian Leger, if it were not so near the Jesuits at Turin.¹ San Martino, the third valley, is happily less beautiful.² It is a wild ravine pierced by a fierce mountain torrent—the Germanasca. On each side of the stream the huge Alps shoot upward, and ranges of inaccessible cliffs and crags frown over the narrow vale beneath. Its climate is severe, its people hardy. In the upper part of the valley winter is almost perpetual. The snow lies for eight or nine months on the ground. The crops are scanty, the herbage faint and rare. The shrill cry of the marmot, the shriek of the eagle, alone disturb the silence of the Vaudois Sabbath; and in the clear, bright air the graceful chamois is

¹ Leger, *L'Histoire Generale des Eglises Vaudois*, p. 2. Vaudois and Waldenses are words of the same meaning. They are defined, "The people of the valleys."

seen leaping from peak to peak of his mountain pastures.

San Martino has formed for ages the citadel of the Vaudois, the last refuge of religious freedom. Often, when the papal troops had swept over its sister valleys, filling their fairer scenery with bloodshed and desolation, the brave people of the interior vale defied the invaders. The persecutors turned in alarm from the narrow pass where every crag concealed a marksman; where huge stones were rolled upon their heads from the heights above; where every cave and rock upon the mountain-side were tenanted by a fearless garrison. Here, within the borders of Italy itself, the popes have never been able, except for one unhappy interval, to enforce their authority. Here no mass has been said, no images adored, no papal rites administered by the native Vaudois. It was here that Henry Arnaud, the hero of the valleys, redeemed his country from the tyranny of the Jesuits and Rome; and here a Christian church, founded perhaps in the apostolic age, has survived the persecutions of a thousand years.¹

The territory of the Vaudois embraces scarcely sixteen square miles. The three valleys can never have contained a population of more than twenty thousand. In every age the manners of the people have been the same. They are tall, graceful, vigorous; a mountain race accustomed to labor or to hunt the chamois in his native crags. The women are fair and spotless; their rude but plaintive hymns are often heard resounding from the chestnut groves; their native refinement softens the apparent harshness of their frugal lives.² Over the whole population of the Vaudois valleys has ever rested the charm of a spotless purity. Their fair and tranquil countenances speak only frankness and simplicity; their lives are passed in deeds of charity, in honest labors, and in unvarying self-respect.³ The vices and the follies, the luxury and the crime that have swept over Europe never invaded the happy valleys, unless carried thither by the papal troops. No pride, no avarice, no fierce resentment disturbs the peaceful Vaudois; no profanity, no crime is heard of in this singular community. To wait upon the sick, to aid the stranger, are eagerly contended for as a privilege; compassion, even for their enemies, is the crowning excellence of the generous race. When their persecutor, Victor Amadeus II., was driven from Turin by the French, he took refuge in the valleys he had desolated, in the cottage of a Vaudois peasant. Here he lived in perfect security. The peasant might have filled his house with gold by betraying his guest; he refused; the duke escaped,

and rewarded his preserver with characteristic parsimony. In the French wars of the last century, when Suwarrow was victorious among the Alps, three hundred wounded Frenchmen took shelter in the village of Bobbio. The Vaudois cared for their former persecutors as long as their scanty means allowed, and then, taking the wounded soldiers on their shoulders, carried them over the steep Alpine passes and brought them safely to their native France.

We may accept, for we can not refute, the narrative of their early history given by the Vaudois themselves.¹ Soon after the dawn of Christianity, they assert, their ancestors embraced the faith of St. Paul, and practiced the simple rites and usages described by Justin or Tertullian. The Scriptures became their only guide; the same belief, the same sacraments they maintain to-day, they held in the age of Constantine and Sylvester. They relate that, as the Romish church grew in power and pride, their ancestors repelled its assumptions and refused to submit to its authority; that when, in the ninth century, the use of images was enforced by superstitious popes, they, at least, never consented to become idolaters; that they never worshiped the Virgin, nor bowed at an idolatrous mass. When in the eleventh century Rome asserted its supremacy over kings and princes, the Vaudois were its bitterest foes. The three valleys formed the theological school of Europe. The Vaudois missionaries traveled into Hungary and Bohemia, France, England, even Scotland, and aroused the people to a sense of the fearful corruption of the church.² They pointed to Rome as the antichrist, the centre of every abomination. They taught, in the place of the Romish innovations, the pure faith of the apostolic age. Lollard, who led the way to the reforms of Wycliffe, was a preacher from the valleys; the Albigenses of Provence, in the twelfth century, were the fruits of the Vaudois missions; Germany and Bohemia were reformed by the teachers of Piedmont; Huss and Jerome did little more than proclaim the Vaudois faith; and Luther and Calvin were only the necessary offspring of the apostolic churches of the Alps.

The early pastors of the Vaudois were called *barbes* (uncle); and in a deep recess among the mountains, hidden from the persecutor's eye, a cave is shown where in the Middle Ages a throng of scholars came from different parts of Europe to study the literature of the valleys.³ The *barbes* were well qualified to teach a purer faith than that of Rome: a Vaudois poem, written about 1100, called the "Noble Lesson," still exists, and inculcates a pure morality and an apostolic creed;⁴ a catechism of the twelfth

THE VALLEYS OF THE VAUDOIS.

Towns.—1. Lucernette; 2. Lucerna; 3. La Tour; 4. Saint John.

Valleys.—5. Valley of Salubral or Lucernette; 6. Valley of Rora; 7. Valley of Lucerna or Pelis; 8. Valley of Anzognan (the lower part opening into the Valley of Lucerna); 9. Basin of Saint John. Mountains.—10. Mt. Froidland; 11. Mt. Brouard; 12. Mt. Fahnvas; 13. Le Courmoud; 14. Mt. Vauduin; 15. Peak of Cella Velles; 16. Côte Ronssine; 17. Mountains of La Vachere; 18. Les Sommaliettes; 19. Colliere of Saint John.

century has also been preserved; its doctrines are those of modern Protestantism. The Vaudois church had no bishop;¹ its head was an elder, *majorales*, who was only a presiding officer over the younger barbes. But in that idyllic church no ambition and no strife arose, and each pastor strove only to excel his fellows in humility and in charitable deeds.

From Constantine to Hildebrand, from the third to the eleventh century, the Vaudois, we may trust, cultivated their valleys in peace.² The Roman church, engaged in its strife with emperors and kings, overlooked or despised the teachers of the mountains. In the contest of giants the modest shepherds were forgotten. Yet they aimed with almost fatal effect the rustic sling of truth against the Roman Philistine. Nothing is more plain than that from the twelfth to the fifteenth century the people of Europe were nearly united in opposition to the Roman see. The popes had never yet been able to reduce to subjection the larger portion of the Christian church; it was only over kings and princes that their victories had been achieved. Every country in Europe swarmed with dissidents, who repelled as antichrist the bishop of Rome; who pointed with horror and disgust to the vices and the crimes of the Italian prelates and the encroaching monks. In Languedoc and Provence, the home of the troubadour and of medieval civilization, the Roman priests were pursued to the altars with shouts of derision.³ Bohemia, Hungary, and Germany were filled with various sects of primitive Christians, who had never learned to worship graven images, or to bow before glittering Madonnas. Spain, England, Scotland, are said by the Vaudois traditions to have retained an early Christianity. In the fourteenth century it is certain that nearly half England accepted the faith of Lollard and Wycliffe. The Romish writers of the thirteenth century abound in treatises against heretics;⁴ the fable of a united Christendom, obeying with devoted faith a pope at Rome, had no credence in the period to which it is commonly assigned; and from the reign of Innocent III. to the Council of Constance (1200-1414) the Roman church was engaged in a constant and often doubtful contest with the widely-diffused fragments of apostolic Christianity.⁵

The popes had succeeded in subjecting kings and emperors; they now employed them in crushing the people. Innocent III. excited Philip of France to a fierce crusade against the Albigenses of the south; amidst a general massacre of men, women, and children the gentle sect sank, never to appear again. Dominic in-

vented, or enlarged, the Inquisition; and soon in every land the spectacle of blazing heretics and tortured saints delighted the eyes of the Romish clergy.¹ Over the rebellious kings the popes had held the menace of interdict, excommunication, deposition; to the people they offered only submission or death. The Inquisition was their remedy for the apostolic heresies of Germany, England, Spain—a simple cure for dissent or reform. It seemed effectual.² The Albigenses were perfectly extirpated. In the cities of Italy the Waldenses ceased to be known. Lollardism concealed itself in England; the scriptural Christians of every land who refused to worship images or adore the Virgin disappeared from sight; the supremacy of Rome was assured over all Western Europe.

Yet one blot remained on the fair fame of the seemingly united Christendom. Within the limits of Italy itself a people existed to whom the mass was still a vain idolatry, the real presence a papal fable; who had resisted with vigor every innovation, and whose simple rites and ancient faith were older than the papacy itself. What waves of persecution may have surged over the Vaudois valleys in earlier ages we do not know; they seem soon to have become familiar with the cruelty of Rome; but in the fifteenth century the popes and the inquisitors turned their malignant eyes upon the simple Piedmontese, and prepared to exterminate with fire and sword the Alpine church.

And now began a war of four centuries, the most remarkable in the annals of Europe. On the one side stood the people of the valleys—poor, humble, few. Driven to resistance by their pitiless foes, they took up arms with reluctance; they fought only for safety; they wept over the fallen.³ Yet it soon appeared that every one of the simple mountaineers was a hero; that he could meet toil, famine, danger, death with a serene breast in defense of his loved ones and his faith; that his vigorous arm, his well-ordered frame, were more than a match for the mercenary Catholic, the dissolute Savoyard; that he joined to the courage of the soldier the Christian ardor of the martyr; that he was, in fact, invincible. For four centuries a crusade almost incessant went on against the secluded valleys. Often the papal legions, led by the inquisitors, swept over the gentle landscape of Lucerna, and drove the people from the blazing villages to hide in caves on the mountains, and almost browse with the chamois on the wild herbage of the wintry rocks. Often the dukes of Savoy sent well-trained armies of Spanish foot to blast and wither the last trace of Christian civilization in San Martin or Perouse. More than once the best soldiers and the best generals of Mazarin and Louis XIV.

¹ Authentic Details, etc. "Four of the best-informed pastors agreed that they never had any bishops at any time."

² The feeble condition of the papacy from 800 to 1000 left it with but little influence in the West. Spain and France were quite independent.

MARTYRDOM OF A VAUDOIS.

hunted the Vaudois in their wildest retreats, massacred them in caves, starved them in the region of the glaciers, and desolated the valleys from San Jean to the slopes of Guinevert. Yet the unflinching people still refused to give up their faith. Still they repelled the idolatry of the mass; still they mocked at the antichrist of Rome. In the deepest hour of distress the venerable *barbes*¹ gathered around them their famine-stricken congregations in some cave or cranny of the Alps, administered their apostolic

¹ *Barbe* means uncle. Leger, p. 205. C'estoit l'appeller *oncle*. A name always honorable in the south of France.

rites, and preached anew the Sermon on the Mount. The psalms of David, chanted in the plaintive melodies of the Vaudois, echoed far above the scenes of rapine and carnage of the desolate valleys; the apostolic church lived indestructible, the coronal of some heaven-piercing Alp.

The popes, the leaders of the Inquisition, the dukes of Savoy, bigoted and cruel, often condescended to flatteries and caresses to win those they could not conquer; they offered large bribes to the poorest mountaineer who would consent to abandon the church of his fathers and betray the haunts of the heretic. Wealth,

honors, the favor of his king and of the Romish priests, awaited him who would recant; an easy path of preferment lay open to the young men of the valleys, accustomed only to toil and want; they were tempted as few other men have ever been. Yet the papal bribes were even less successful than the papal arms. A few imbeciles who had lost their moral purity alone yielded to the allurements of gain and pleasure; the great body of the Vaudois youth rejected the offers with disdain. The stately magnanimity of the Noble Lesson, the simple principles of their ancient catechism,¹ taught them in their plain churches by some learned yet gentle barbe, raised them above those inferior impulses by which the corrupt world beneath them was controlled. No hereditary vices tarnished their fair organizations; no coarse disease impaired their mental and moral vigor. With a wisdom above philosophy they saw that it was better to live with a calm conscience a frugal life than to revel in ill-gotten gold. They clung to their mountains, their moral purity, and their faith. Generation after generation, fiercely tried, hardly tempted, never wavered in their resolve. The war of four centuries for liberty of conscience, for freedom to worship God, was accepted by the youthful Vaudois as their noblest inheritance; the contest went on with varying success but equal vigor, and ceased only, in its final consequences, when the triumphant voice of Garibaldi proclaimed Italy forever free.

Pope Innocent VIII., a man of rare benevolence, according to the Romish writers, and a devoted lover of Christian union, resolved (1487) to adorn his reign by a complete extinction of the Vaudois heresy. He issued a bull summoning all faithful kings, princes, rulers, to a crusade against the children of the valleys.² No heretic was to be spared; his goods, his life, were declared forfeited unless he would consent to attend mass. The pope, or his inquisitor, enumerated in a pastoral letter the crimes of the Vaudois. He charged them with calling the Roman church a church of the evil one;³ of denouncing the worship of the Virgin, the invocation of saints; of asserting, with unblushing boldness, that they alone possessed the pure doctrine of the apostles. To Albertus Capitanus was committed the sacred trust of leading an army into the guilty region, and executing upon its people the sentence of Rome. The Catholics gathered together in great numbers at the appeal of the chief inquisitor; a tumultuous throng of soldiers, brigands, priests, entered the valleys and commenced a general pillage. But they were soon disturbed in their

labors by the swift attacks of the Vaudois. The resolute and fearless mountaineers sallied from their caves and ravines and drove the robbers before them. One Christian, armed only with the vigor of innocence, seemed equal to a hundred papists. The crusaders fled, beaten and affrighted, from the valleys; the malevolent design of Innocent was never fulfilled; and the Romanists asserted and believed that every Vaudois was a magician, and was guarded by an invisible spell.

Yet still the perpetual persecution went on. The papal agents made their way into the lower portions of the valleys, seized the eminent barbes and faithful teachers, and burned them with cruel joy. The Vaudois never knew any respite from real and imminent danger. Ever they must be ready to fly to their mountains and caves; ever their trembling wives and children were exposed to the cruelty and cunning of the envious priests.¹ The sixteenth century opened. The Reformation came, and the chief reformers of France and Germany entered into a friendly correspondence with the barbes and churches of Piedmont. They admitted the purity of their faith, the antiquity of their rites. But the rise of the Reformation served only to deepen the rage of the papists against the children of the valleys. The darkest days of the Vaudois drew near, when their enemies could for a moment boast that the last refuge of Italian heresy had fallen before their arms.

In 1540 the society of Loyola began its universal war against advancing civilization. The Inquisition was renewed with unparalleled severity; the cities of Italy were hushed into a dreadful repose; the protestants of Venice were thrown into the Adriatic; the reformers of Rome died before the church of Santa Maria.² Italy was reduced to a perfect obedience to the papal rule, and for the first time in the history of its career of innovations the Roman church was powerful and united at home. The iron energy of the Jesuits had crushed dissent. They next proceeded to declare and decide the doctrine of the usurping church. The Council of Trent assembled (1545), and Loyola and Lainez slowly enforced upon the hesitating fathers a rigid rule of priestly despotism.³ Liberty of conscience was denounced as the chief of heresies; the opinions and the manners of mankind were to be decided at Rome; the pope was to be obeyed before all earthly sovereigns, and his divine powers were every where to be established by a universal persecution. The Council of Trent at once threw all Europe into a fearful commotion. At the command of the pope, the Jesuits, and the fathers of Trent, Charles V. began the first great religious war in Germany, and carried desolation and death

¹ Faber, Hist., etc., of the Ancient Waldenses, London, 1838, may be consulted, with some caution. It gives a clear review of the authorities for their antiquity.

to its fairest borders. In France the French court drove the Huguenots to revolt by an insane tyranny. In Holland the rage of the inquisitors had been stimulated by the lessons of Loyola.

Of all its opponents Rome most hated the Vaudois. To bind one of the primitive Christians to the stake seemed to give strange satisfaction to their modern persecutors. In September, 1560, Pope Pius IV. and his holy college gathered at Rome to witness one of their favorite spectacles.¹ A pile had been raised in the square of St. Angelo, near the bridge over the Tiber. The people assembled in a great throng. The condemned, a pale and feeble young man, was led forth; when suddenly he began to speak with such rare eloquence and force that the people listened; the pope grew angry and troubled, and the inquisitors ordered the Vaudois to be strangled, lest his voice might be heard above the flames. Pius IV. then saw the martyrdom in peace, and directed the ashes of his foe to be thrown into the Tiber.

The martyr was John Louis Paschal, a young pastor of great eloquence, who had been called from Geneva to a congregation of Vaudois in Calabria. The post of danger had a singular charm for the brilliant preacher. He was betrothed to a young girl of Geneva. When he told her of his call to Calabria, "Alas," she cried, with tears, "so near to Rome, and so far from me!" Yet she did not oppose his generous resolve, and he went to his dangerous station. Here his eloquence soon drew a wide attention. He courted by his boldness the crown of martyrdom. He was shut up in a deep dungeon, was chained with a gang of galley-slaves, was brought to Rome where Paul had suffered, and was imprisoned in a long confinement.² His persecutors strove to induce him to recant; but no bribes nor terrors could move him. He wrote a last fond exhortation to Camilla Guarina, his betrothed; his eloquence was heard for the last time as he was strangled before the stake.³

Innumerable martyrdoms now filled the valleys with perpetual horror. It is impossible to describe, it is almost inhuman to remember, the atrocities of the papal persecutors. Neither sex nor age, innocence, beauty, youth, softened their impassive hearts. Mary Romaine was burned alive at Roche-Plate; Madeleine Fontane at St. John. Michel Gonet, a man nearly a hundred years old, was burned to death at Sarcena. One martyr was hacked to pieces with sabres, and his wounds filled with quicklime; another died covered with brimstone matches, that had been fastened to his lips, nostrils, and every part of his body. The mouth of one martyr was filled with gunpowder, the

explosion tearing his head to pieces. The story of a poor Bible-seller from Geneva is less revolting than most of these dreadful scenes.¹ Bartholomew Hector wandered among the peaks of the highest Alps selling the printed Scriptures to the poor shepherds, who in the brief summer, when the mountains break forth into a rich growth of leaves, grass, and flowers, lead their flocks to the higher cliffs. They bought the Bibles readily, and the *colporteur* climbed cheerfully from peak to peak. The police seized him and carried him to Pignerol. He was charged with having sold heretical books; he insisted that the Bible could not be called heretical; but the Holy Office condemned him, June 19, 1556, and he was sentenced to be burned alive; some alleviation of the penalty was afterward made, and the judges permitted the executioner to strangle him before the burning. He was offered his life and liberty if he would recant; he replied by preaching in his prison, with wonderful eloquence, the pure doctrines of the book he had loved to distribute. Amidst the brilliant palaces of Turin, in the public square, the happy martyr died, surrounded by a throng of people who wept over his fate. The priests were unable to suppress that proof of a lingering humanity.

Five Protestants from Geneva were traveling toward the Vaudois valleys. They were warned that the police were watching for them, yet they still pressed on, and were arrested in an unfrequented road where they had hoped to escape pursuit. Two of them, Vernoux and Laborie, were pastors of the valleys. They were all taken before the inquisitors at Chambery, and convicted as heretics. They were next brought before the civil court to be condemned. The judges, touched by their innocence, strove to prevail upon them to recant. "You need only give us a simple confession of your errors," said the court; "and this will not prevent you from resuming your faith in the future." They refused to consent to the deceit, and were sentenced to die. "Anne, my beloved sister and spouse,"² wrote Laborie to his young wife, "you know how well we have loved one another. I pray you, therefore, that you be always found such as you have been, and better, if possible, when I am no more." Calvin, hearing of their danger, wrote them an austere exhortation. In the stern spirit of that age of trial, he urged them to bear a testimony to the faith that should resound afar, where human voices had never reached. The five died full of hope. They were strangled, and their bodies burned.³ In this fatal period the public square of Turin was constantly made the scene of touching martyrdoms and holy trials; the Jesuits and the Franciscans every where urged on the zeal of the inquisitors; no village of the Vaudois valleys but had its martyrs, no rock nor crag but witnessed and was hallowed by some joyous death; the rage of persecution grew in strength until it

POPE PIUS IV. AND HIS CARDINALS WITNESSING THE DEATH OF PASCHAL.—FROM AN ANCIENT ENGRAVING.

could no longer be satisfied with less than a perfect extermination of the Vaudois.

Thus around the simple Christians of the valleys seemed to hang every where the omens of a dreadful doom. In the general tide of persecution they could scarcely hope to escape a final destruction. From the towers and cathedrals of Turin the Jesuits¹ looked with envious eyes upon the gentle race who neither plotted nor schemed; to whom cunning was unknown and deceit the ruin of the soul; who never planned a persecution, fomented religious wars, or guided

the assassin's hand; who read the Scriptures daily, despite the anathemas of Rome, and who found there no trace of the papal supremacy or the legend of St. Peter.¹ The Vaudois, indeed, had never concealed their opinions. For centuries they had said openly that the pope was antichrist;² they had condemned each one of the papal innovations as they arose; they denounced the Crusades as cruel and unchristian; they gave shelter in their valleys to the perse-

¹ Peyran, *Nouv. Lett.*, p. 61. The Waldenses always denied that Peter was ever at Rome.

² They said pape étoit l'antichrist, l'hostie une idole, et le purgatorie une fable, Leger, p. 6.

¹ Leger, 2.

cuted Albigenses; they smiled with gentle ridicule at the worship of saints and relics; they scoffed at the vicious monks and priests who strove to convert them to the faith of Rome. Yet now they consented to claim the clemency of their sovereign, the Duke of Savoy, and humbly begged for freedom of worship and belief.¹ They were so innocent that they could not understand why one Christian should wish to rob or murder another.

But their prayers, their humility, and their innocence brought them no relief. The Council of Trent was about to reassemble, and the Jesuits had resolved that its last sittings should be graced by a total destruction of the ancient churches of the valleys.² A new crusade was begun (1560) against the Vaudois. The pope, the Duke of Savoy, the kings of France and Spain, promoted the sacred expedition; a large army, led by the Count of Trinity, moved up the valleys; again the Jesuits offered to the people submission to the mass or death; again the brave mountaineers left their blazing homes, and fled to the caves and crannies of the upper Alps. The Count of Trinity was every where victorious. The barbes of St. Germain were burned in their own village, and the poor women of the parish were forced to bring fagots on their backs to build the funeral pile. The open country was desolated; the mass was celebrated with unusual fervor amidst the dreadful waste; and the Jesuits exulted with fierce joy over the ruin of the apostolic church. But once more, as the winter deepened, the cliffs grew icy, and huge avalanches of snow hung over the path of the invaders, the Vaudois fortified every ravine,³ barricaded the narrow passes, and from their fastnesses and caves made vigorous attacks upon the foe. The Count of Trinity found himself threatened on every side. In the valley of Angrogna a few peasants held a whole army in check. Fifty Vaudois, in one engagement, nearly destroyed a detachment of twelve hundred persecutors. The Vaudois leaped like chamois from crag to crag, and with swift sallies cut off the wandering brigands; they threw them over the cliffs, drowned them in the deep mountain torrents, or rolled huge stones upon their heads. The winter passed on full of disaster to the crusaders. Yet the condition of the Vaudois was even less tolerable. The snow and ice of the Alps blocked up the entrance to their hiding-places; men, women, and children shivered in rude huts of stone on the bleak mountain-side; food was scanty; their harvests had been gathered by the enemy; while far beneath them they saw their comfortable homes wasted by the Romish brigands, and their plain churches defiled by the pagan ceremonies of the mass.

In the spring, as the flowers bloomed once more in the declivities of the mountains, and the banks of the torrents glowed with a new

vegetation, the final trial of their faith and their valor drew near. At the upper extremity of the valley of Angrogna is a circle of level ground, called Pra del Tor, surrounded on all sides by tall hills and mountain peaks, and entered only by a narrow pass.¹ Behind it is altogether safe from attack; in front, in the ravines leading from below, the Vaudois had raised their simple barricades, and stationed their sentinels to watch the approach of the foe. Here, in this natural fortress, they had placed their wives and children, their old and infirm, had gathered their small store of food and arms, and celebrated their ancient worship in a temple not made with hands.² The Count of Trinity meantime had resolved upon their complete destruction. With a large and well-trained army he marched swiftly up the valley. His forces consisted of nearly ten thousand men, and among them was a large body of Spanish infantry, the best soldiers of the age. The crusaders were inspired by the prospect of an easy success, by the superiority of their numbers, by the blessing of the pope, and by his promise of a boundless indulgence. A fierce fanaticism, a wild excitement, stirred by the exhortations of the Jesuits and the priests, ruled in the ranks of the invaders; the Vaudois, behind their rocks, prayed with their gentle barbes, and with firm hearts prepared to die for their country and their faith.

The battle of the Pra del Tor is the Marathon of Italian Christianity: it was invested with all the romantic traits of patriotic warfare. The army of the Count of Trinity, clad in rich armor and glittering with military pomp, marched in well-trained squadrons up the beautiful valley; the clamor of the trumpets startled the chamois on his crags, and drove the eagle from her nest; the waving plumes, the burnished arms, the consecrated banners, shone in the sunlight as they drew near the defenses of the mountaineers.³ Behind the Italian troops came the Spaniards, the bravest, the most bigoted of the crusaders. They, too, wore heavy armor, and were irresistible in the open field. In the rear of the invaders followed a throng of plunderers, brigands, priests, prepared to profit by a victory that seemed perfectly assured. To this well-trained army were opposed only a few hundred Vaudois. They were stalwart and agile, but meagre with toil and famine. Their dress was ragged; their arms broken and imperfect. To their brilliant assailants they seemed only an undisciplined throng; a single charge must drive them routed up the valley. The Count of Trinity gave orders to attack, and the Savoyard infantry marched against the heretics. They were hurled back like waves from a sea-girt rock. The Vaudois filled the pass with a rampart of their bodies, and whenever the Rom-

¹ Muston, i. 255, describes Pra del Tor as a deep recess among the mountains.

³ Id., p. 34.

ish squadrons approached they were met by a rain of bullets, every one of which seemed directed with unerring aim. The ground was soon covered with the dead, and the chant of thanksgiving resounded within the amphitheatre of the Alps.

For four days the papal forces kept up their vain assault. The Vaudois still maintained their invincible array. Within the fastness the wives and daughters, the aged and infirm, were employed in bringing food to their heroes, in supplying them with ammunition, and cheering them with words of faith. The Count of Trinité, enraged at his misfortune, at length ordered the Spanish infantry to charge. They came on in swift step to the clamor of martial music. But their ranks were soon decimated by the bullets of the patriots; the officers fell on all sides; and the well-trained troops refused any longer to approach the fatal pass. Four hundred dead lay upon the field. A wild panic seized upon the papal army, and it fled disordered and routed through the valley.¹

Then the Vaudois came out from their hiding-places, and chased the crusaders along the open country far down to the borders of Angrogna. No mercy was shown to the ruthless papists. They were flung over the rocks into the fathomless abyss, shot down by skillful marksmen as they strove to hide in the forest, and followed with pitiless vigor in their desultory flight. No trace remained of that powerful army that a few days before had moved with military pomp to the capture of Pra del Tor; its fine battalions had been broken by the valor of a few mountaineers; a rich booty of arms and provisions supplied the wants of the heroes of the valley.

From this time (1561) for nearly a century no new crusade was preached against the Vaudois. Their native sovereigns were satisfied with lesser persecutions. The barbes, as usual, were often burned; the valleys were oppressed with a cruel taxation; the earnings of the honest people were torn from them to maintain dissolute princes and indolent priests. In 1596 Charles Emanuel ordered all the Vaudois, under pain of death or exile, to attend the preaching of the Jesuits,² and the valleys were filled with the disciples of Loyola, who strove to corrupt or terrify the youth of the early church. To every convert was offered an exemption from taxation, and various favors and emoluments were heaped upon him who would attend mass. Yet the restless Jesuits were altogether unsuccessful. Their preaching and their bribes were equally condemned by the happy mountaineers; the church still lived unspotted from the world.³ During this period of tolerable suffering the valleys once more glowed with the products of

a careful industry; they were the homes of purity and thrift. Singular among their race, the inheritors of a long succession of elevated thought, the Vaudois have ever practiced an ideal virtue loftier than that of Plato. When feudalism taught that labor was dishonorable, the people of the valleys held every family disgraced that did not maintain itself by its own useful toil. When the learned Jesuits had proved that deceit was often lawful, the Vaudois declared that falsehood was the corruption of the soul. In the happy valleys no one desired to be rich, no one strove to rise in rank above his fellows. While in the gifted circles of the European capitals the purity of woman was scoffed at by philosophers and courtiers, in Luzerna and Perouse every maiden was a Lucretia. Crime had seldom been known in the peaceful valleys; it was only in barbarous lands where the Jesuits ruled that the assassin aimed his dagger or the robber plied his trade.¹ To harm no one, to be at peace with all men, to forgive, to pity, were the natural impulses of every Vaudois; to heal the sick, to raise the low, to relieve the suffering stranger, formed the modest joys of the children of the valleys. In every age they remained the same; in every age they were Christians. The seventeenth century of their faith, perhaps of their existence, found them still an uncorrupted church, teaching to the world unlimited freedom of conscience. For this they were willing to peril their lives and fortunes; for this they had contended with popes and kings; and on every cliff and mountain peak of their native land was inscribed in immortal deeds the independence of the soul.²

Meantime, while no change had taken place in the Alpine church, its doctrines and rites had been accepted by all Northern Europe. In the seventeenth century the papacy had lost its most powerful and warlike adherents. England in 1650, ruled by Cromwell, instructed by Milton, stood in the front rank of the progressive nations. Holland and Northern Germany maintained their free schools and their liberal press in defiance of the Jesuits and the pope. France had been forced to tolerate the Huguenots. It was only over Italy and Spain that the Inquisition of Loyola, founded in 1541, held its terrible sway. There the papal power had been erected upon a relentless despotism, and the unhappy people were rapidly sinking to a low rank among civilized nations. The rule of the Jesuits was followed by a total decay of morals, a general decline of the intellect. Once Italy had been the centre of classic elegance, of the reviving arts, of the splendors of a new civilization. It was now the home of gross superstitions, a degraded priesthood, a hopeless people. Spain and Portugal, once the leaders in discovery, the rulers of the seas, had fallen into a new barbarism. The Jesuits, the Inquisition, alone flourished in their fallen capi-

² J. Bresse, *Hist. Vaud.*, p. 39.

tals and deserted ports; the manly vigor of the countrymen of the Cid had been corrupted by centuries of papal tyranny.

In the seventeenth century the Vaudois were the only progressive portion of the Italian race.¹ Every inhabitant of the valleys was educated; the barbes were excellent teachers, their people eager to learn; the laborers instructed each other as they toiled side by side on their mountains; their industry was the parent of active minds. If they produced no eminent poet to sing of dreadful war, no astute philosopher, no vigorous critic, they could at least point to several native historians of considerable merit; to their "Noble Lesson," the finest of medieval poems; to their stirring hymns and versions of the Psalms;² to a long succession of intelligent barbes; to their missionaries of the Middle Ages; to their colleges and schools in Alpine caves. They might claim that the ideas of the valleys had promoted the civilization of Europe, and that their perpetual protest in favor of liberty of thought had been of more value to the world than Tasso's epic or Raphael's Madonnas.

A pestilence swept over the valleys in 1630; nearly all the pastors died, and the Vaudois were forced to send to Geneva for a new band of teachers. The Calvinistic system of government, in a milder form, was now adopted; the name of barbe was no longer used; the ruling elder was called a moderator; the pastors were usually educated at Geneva; and the ancient catechism of the twelfth century was exchanged for a modern compilation.³ Yet the Vaudois have never consented to be called Calvinists, Protestants, or Reformers; they insist that they are primitive Christians, who have never changed their doctrine or their ritual since the days of St. Paul;⁴ who have beheld untainted all the corruption of the Eastern or the Western church; whose succession from the Apostles is proved by no vain tradition, no episcopal ordination, but by an uninterrupted descent of Christian virtues and an apostolic creed. They modestly assert that they have ever used the simple ritual employed by James, the brother of the Lord, at Jerusalem, or Paul at Antioch; and that they prefer to retain unchanged the name they bore before the popes wore the tiara of an-

tichrist, and before Christians were oppressed by the corruptions and the crimes of a visible church.

So much liberality of doctrine, such purity of life and faith, could not fail to deserve the constant hostility of the Jesuits. That famous company was now in the maturity of its early vigor. Its flourishing colleges filled the Catholic capitals of Europe; its countless members, bound by their terrible oath of obedience, moved like a united army upon the defenses of the reformed faith. They had subjected Italy, had desolated Spain; they once more turned the whole energy of the united order to the extirpation of the children of the valleys. In 1650 the Jesuits founded a propaganda at Turin in imitation of that at Rome.¹ Its design was to spread the Roman faith, to extirpate heresy by all the most powerful instruments of force or fraud. A council was formed, composed of the most eminent citizens, who were to act as general inquisitors. Among them were the Marquis of Pianessa, the Grand Chancellor, the President of the Senate; its chief officer was the Archbishop of Turin. Connected with the propaganda was a council of distinguished and wealthy women, who proved even more zealous than the men. The noblest ladies of Turin joined in the new crusade; large sums of money were collected to aid the movement; the emissaries of the two councils united in visiting families suspected of heretical practices, and in striving to win over converts by intimidation or bribes. The poor serving-woman from the valleys was often assailed by a noble tempter; the heretics of a higher rank were won by flatteries and attentions. The languid atmosphere of the capital of Savoy was stirred by the new effort to propagate the creed of Rome.

From the higher peaks of their native Alps the Vaudois look down upon the palaces and cathedrals of Turin. Before them lies that magnificent scene with which Hannibal stimulated the avarice of his toil-worn army as he pointed out the path to Rome. But in the seventeenth century the rude village of the Taurini had grown into a powerful and splendid city; the landscape was rich with the product of centuries of toil; the plains of Piedmont were the gardens of the age. The Vaudois, ever loyal and forgiving, had never failed in their duty to their sovereigns. The dukes of Savoy, always their worst persecutors, seem yet to have obtained their lasting regard. They appealed to their clemency in moments of danger. They had usually been sternly told to choose between the mass and ruin. Yet, in 1650, they had enjoyed a period of comparative rest; and little did they foresee, as they looked down upon the city of their sovereign and the rich plains around, that the great and the noble were plotting their destruction, that the last

¹ Muston, *Hist. Vaud.* i. 394. Nos temples ne sont décorés ni de croix ni d'images, etc.

² Raynouard, ii. p. 71 *et seq.*, gives extracts from the early Vaudois poems. The fine hymn *Lo Payre Eternal* contrasts boldly with the feeble Romish hymns to Mary or the saints.

³ Muston, *Israel of Alps*, i. 310.

⁴ The fine Middle Age Protestant hymn, *Lo Payre Eternal*, "The Eternal Father," expresses the noble feeling of the mountain church. I add a few lines. The poet calls on God to pity and forgive, and then asks to reign with Him in a celestial kingdom.

Rey glorios, regnant sobre tuit li regne,

Fay me regner cum tu al tio celestial regne

Que yo chante cum tuit li sant e sempre laudar te degne.

See Raynouard, ii. p. 117. With this contrast a feeble chant to the Virgin:

O Marie! de Dieu mère, Dieu t'est et fils et père!

¹ Leger, part ii. p. 73, describes the Jesuit propaganda at Turin, and imputes to it all the misfortunes of his country.

VAUDOIS WOMEN BURIED ALIVE.—FROM A CONTEMPORARY ENGRAVING.

crowning trial of their ancient church was near at hand.

The first omen of danger was a new influx of Jesuits. The valleys were thronged with haggard and fanatical missionaries. They pressed into remote districts, and celebrated mass in scenes where it had never been heard before. A ceaseless plotting went on against the faithful Vaudois; every art was employed to bribe the young; to arouse the pastors to a dangerous resistance; to disturb the harmony of families and fill the valleys with domestic strife. In Turin the Inquisition sat constantly, and before its hated tribunal were summoned the most noted of the Vaudois. If they failed to appear, their goods were forfeited, their lives in peril; if they came, they probably disappeared forever from human sight. The dungeon, the rack, and the *auto da fé* awaited those who denied the infallibility of the pope.

But the Jesuits refused to be satisfied with these isolated persecutions;¹ they pressed the Duke of Savoy to complete the ruin of the Alpine church. The world has witnessed no sadder spectacle than that long reign of terrors that was now spread over the peaceful valleys. In January, 1655, was issued the famous order of Gastaldo, the opening of the dreadful struggle. By this decree, sanctioned by the court of Turin, every Vaudois in the towns at the lower extremity of the valleys was commanded either

to attend mass or to abandon his home and fly to the upper villages. The whole heretic population were to be shut up within a narrow region around Bobbio and Angrogna. It was a winter of singular severity; the snow lay deep in the upper valleys; the torrents rolled down clad in ice; the fields were covered with inundations; the ravines were almost impassable. Yet the sad and long procession of faithful Christians was forced to leave their comfortable homes in Lucerna or St. Jean and bear the horrors of the wintry march. The aged, the sick, the once-smiling children, the feeble and the young, the gentle matron, the accomplished maid, set out in a pitiful throng on their dreadful journey.¹ They waded hand in hand through the icy waters, broke the deep, untrodden snows, climbed the wintry hills, and sought refuge with their impoverished brethren of the Alpine villages. Yet no one recanted; no native Vaudois would consent to escape the pains of exile by attending an idolatrous mass. Whole cities and villages in the lower valleys were nearly depopulated; families were reduced from ease and comfort to extreme and painful want; a fruitful region was desolated; but the Jesuits were disappointed, for the indestructible church survived among the mountains.

Their next project was a war of extermination. A pretext was easily discovered: a priest had been found murdered in a Vaudois village; a convent of Capuchins, planted in one of the

¹ All the authorities unite in fixing the chief guilt of the massacres upon the Jesuits. See Leger, part ii. p. 72 *et seq.*

¹ Leger, part ii. p. 94 *et seq.* Se trouvant dans le cœur du plus rude hyver qu'ils eussent jamais senti.

ruined towns, had been broken up by an impetuous pastor; the mass had been ridiculed; the exiled people sometimes stole back to their desecrated homes. Turin was filled with rage; the duke decreed the destruction of the Vaudois. Again a crusade began against the people of the valleys. The historian Leger, who was a Vaudois pastor, and saw the sufferings and the heroism of his countrymen, has described with startling minuteness the details of the persecution. The papal troops entered the valleys, roused by the priests and Jesuits to an unparalleled madness. Such cruelties, such crimes, have never before or since been perpetrated upon the earth; the French Revolution offers but a faint comparison; the tortures of Diocletian or Decius may approach their reality. The gentle, intelligent, and cultivated Vaudois fell into the power of a band of demons. Their chief rage was directed against women and children. The babe was torn from the mother's breast and cast into the blazing fire;¹ the mother was impaled, and left to die in unpitied agony. Often husband and wife were bound together and burned in the same pyre; often accomplished matrons, educated in refinement and ease, were hacked to pieces by papal soldiers, and their headless trunks left unburied in the snow. A general search was made for Vaudois. Every cave was entered, every crag visited, where there was no danger of resistance; every forest was carefully explored. When any were found, whether young or old, they were chased from their hiding-places over the snowy hills, and thrown from steep crags into the deep ravines below. No cliff but had its martyr; no hill on which had not blazed the persecutor's fire. In Leger's history, printed in 1669, are preserved rude but vigorous engravings of the malignant tortures inflicted by the papal soldiers upon his countrymen; there, in the Alpine solitudes, amidst the snow-clad summits of the wintry hills, are seen the dying matron; the tortured child; the persecutor chasing his victims over the icy fields; the virgin snows covered with the blood of fated innocence; the terrified people climbing higher and higher up the tallest Alps, glad to dwell with the eagle and the chamois above the rage of persecuting man.²

The pope applauded, the Duke of Savoy rejoiced in the massacres of the valleys. The Jesuits chanted their thanksgiving in the ruined villages. The Capuchins restored their convent. The church of Rome ruled over the blood-stained waste. But when the news of the unexampled atrocities of the Alps came to the great Protestant powers of the North, when it was told in London or the Hague that the harmless people

of the valleys, the successors of the Apostles, had been slain in their villages and cut to pieces on their native cliffs, horror and amazement filled all men. The reformers of every land had long looked with interest and affection upon the Alpine church; had admired its heroism, had imitated its simplicity; that it should perish amidst the savage cruelties of the Jesuits and the pope they could scarcely bear. A loud cry of disgust and indignation arose from all the Northern courts.¹ But one mind, the greatest and the purest that had descended upon the earth since the apostolic age, gave utterance to the common indignation. Milton was now Cromwell's secretary, and although blind, watched over the affairs of Europe. His quick perception, his liberal opinions, his ready learning, his easy Latin style, have given to the foreign correspondence of the Protector an excellence never to be equaled in the annals of diplomacy. To the learned, the liberal, the progressive Milton the Alpine church must ever have been singularly dear. It reflected all his own cherished opinions; his own simplicity, naturalness, and love of truth; it was clothed with a halo of historic association that, to his poetic thought, covered it with immortal lustre.

In one great sonnet Milton has condensed the indignation of the age.² He cried to Heaven to avenge its slaughtered saints; he paints with a mighty touch the cold Alps, the dying martyrs, the papal monsters, the persecuted church. No grander strain, no more powerful explication, has fallen from the pen of the lord of modern poetry. The stern enthusiast Cromwell shared Milton's indignation, and the poet and the soldier strove to preserve the Alpine church. Milton wrote, in the name of the Protector, a courtly but vigorous appeal to the murderous Duke of Savoy: Cromwell said that he was bound to the Vaudois by a common faith; that he had heard of their butchery, their exposure on the frozen Alps: he besought the duke to withdraw the edict of extermination. The letter was composed in Latin by Milton, and was copied, it is said, by one of his daughters. It is dated May 25, 1655, soon after the news arrived. All England mourned for the slaughtered saints, and Cromwell appointed a day of fasting and prayer for their deliverance. Large sums of money were collected in London for their support, and the Hollanders were equally liberal. Milton's pen now knew no rest; he wrote to the various Protestant powers to intercede for the Vaudois; he appealed to Louis XIV. of France to give shelter to the exiles and to aid in their preservation. "The groans of those wretched men, the Protestants of Lucerna, Angrogna, and the other Alpine valleys," Cromwell said, "have reached our ears." When the persecutions still continued he wrote in stronger terms;³ and the

THROWN FROM PRECIPICES.—A PICTURE TAKEN AT THE TIME (1655-1665).

bold and stern Sir Samuel Morland¹ was sent as envoy to the court of Turin to remonstrate against its enormities. The ambassador did not spare the papists, at least in words. He told the duke that angels were horrified, that men were amazed, and the earth blushed at the fearful spectacle. The Swiss cantons and the German princes united in a strong remonstrance. Said the Landgrave of Hesse: "Persecutions and butcheries are not the means to suppress a religion, but rather to preserve it." But no sense of shame reached the hearts of the monster duke and his Jesuit advisers; they pretended, with keen subtlety, to listen to the appeals of the Protestant powers, yet they still permitted the work of extermination to go on.

Safe in the shelter of the Italian court and certain of the sympathy of that of France, the Jesuits and the pope heard with secret joy the grief and rage of the arch-heretic Cromwell and his allies of the North. They resolved to persist in their dreadful labors until no trace of heresy should be left upon Italian soil. It is probable that, had the Protector lived, the fleets of England might have avenged the Christians of the valleys; that the artillery of the Puritans might have startled the Italian potentates from their fancied security. But the great chieftain died; the greater poet sank into a happy obscurity, from whence was to shine forth the highest fruit of his genius; and all England was dissolved in fatal license under the dissolute reign of Charles. At his death the Jesuits

rejoiced in the rule of James II., and confidently hoped to bring once more under the papal sway the land of Milton and Cromwell. It was a disastrous period for Protestantism. England no longer stretched forth its powerful arm to shield its weaker brethren. Holland seemed about to sink before the Catholic zeal of Louis XIV. Geneva trembled among its mountains. And at length the Jesuits prevailed upon the King of France to revoke the edict of Nantes and commence a bitter persecution of the Huguenots. The best, the wisest, the most progressive of the French died in crowded prisons or by the arms of the papal butchers, or were glad to escape impoverished to foreign lands; a perfect religious despotism prevailed in France, from which it was only rescued by the convulsive horrors of its Revolution.

There was now no more hope for the Vaudois.¹ Friendless, except in the arm of Him who guided the avalanche and checked the raging torrent in its course, the poor and humble people, cheered by their gallant pastors, bore with patient joy the burden of a fearful existence. From 1655 to 1685 they suffered all the ignominies and all the cruelties that could be inflicted by the malevolent priests. The valleys were filled with monks and Jesuits, and bands of papal soldiers, who ravished the last loaf from the humble homes of the industrious Christians. Often the Vaudois, roused to

¹ Muston began his valuable labors, ed. 1834, by asserting: *La gloire des Vaudois est dans leur malheur.* He had not yet looked forward to their present triumph.

² Gilly, Narrative, p. 229.

resistance by some dreadful atrocity, would fly to arms and perform miracles of valor amidst their native crags; war would rage again along the valleys; and great armies of papists would march from Turin or Pignerol and chase the people to the mountains. Then the old, the sick, women and children, would be carried by the strong arms of their sons and their brothers to some secluded cavern, known only to themselves, and there hide for months until the danger seemed past; in fact, the Vaudois learned, like the marmot, to make their homes in the living rock.

One of these singular natural retreats of safety has perhaps been discovered by a modern traveler. He had searched for many days for the famous cavern of Castelluzo. The memory of the place had been forgotten; it was only known that down some dizzy precipice, overhanging a dreadful abyss, a cave existed, opening into the solid rock, where three or four hundred Vaudois had once lived safe from the pope and the Jesuits. At length his guides assured the traveler that they had found the forgotten retreat. On a fair day of the Alpine autumn, when the golden fields were smiling with the gathered harvests, the stranger ventured to enter, with extreme hazard, the dangerous scene. He could scarcely conceive how old men, women, and children, amidst the snows of winter, could have descended into their only home. The entrance lay over a projecting crag. Far below opened a deep ravine, from which shot up a wall of rock. The cave was cut by Nature's hand in the side of the precipice. A rope-ladder was provided and swung over the projecting cliff. It was made to rest on a slight ledge about fifty feet below. The guides descended, the traveler followed, and with great risk reached the grotto. It proved to be an irregular sloping gallery, formed by the overhanging cliffs. On one side a projecting crag sheltered it from the weather; before it opened the unfathomed abyss. A spring of water seemed to exist in one corner, and a few shrubs and plants grew in the interstices of the rock.¹ The cave was shallow, light, and almost safe from attack. Only a single person could enter it at a time, and a single stalwart Vaudois might here defy an army. Yet there were no traces of its having been inhabited; no smoke of Vaudois fires, nor remnants of arms or furniture; and the traveler left the place still in doubt whether he had really found the famous cave described by Leger, where nature had provided embrasures, windows for sentinels, an oven, and a secure retreat for three hundred of his countrymen.²

At last, in 1685, came that fatal period so long anticipated with triumph by the Jesuits of Turin, when the voice of Christian prayer and praise was no longer heard in the valleys. The wonderful people had survived for six centuries

the enmity of the papacy; but now the Alpine church seemed forever blotted from existence. Louis XIV., the destroyer of the Huguenots and of France, pressed the Duke of Savoy to drive the heretics from his dominions. General Catinat, one of the best commanders of the time, led a well-appointed army into the valleys; the people took up arms, and, with their usual heroism, at first baffled and defeated the efforts of the French; then a lethargy seemed to pass over them, and they yielded to the foe. A dreadful punishment now fell upon them. The papal soldiers swept through the valleys, made prisoners of nearly the whole population, and carried them away to the dungeons of Turin. Fourteen thousand persons were shut up in a close confinement. The consequences were such as might have touched the hearts of Diocletian and Decius, but to the Jesuits and to Rome they were only a source of insane joy. The stalwart mountaineers, and their wives and children, shut out from their free Alpine air, starved and persecuted, pined in a horrible imprisonment. Diseases raged among them; a pestilence came; and of the fourteen thousand saints, the followers of Christ, only three thousand came, emaciated and pale, from their noisome dungeons. Eleven thousand had died to satisfy the malice of Rome.

There was now peace in the silent valleys; villages without inhabitants, homes without a family, churches no longer filled with the eloquence of supplication. A few Romanists alone occupied the silent scene. At length a colony of papists, gathered from the neighboring country, was sent in to take possession of the fields and dwellings of the Vaudois; the churches of the ancient faith were torn down or converted into Romish chapels; the Jesuits wandered freely from St. Jean to Pra del Tor. For the first time since the dawn of Christianity the Virgin was worshiped beneath the crags of San Martino, and the idolatry of the mass desecrated the scene so long consecrated by an apostolic faith. For three years the rule of the papists remained undisturbed. The sad remnant of the Vaudois meantime had wandered to foreign lands. Several thousand climbed the Alps, and came, emaciated and wayworn, to the Swiss. Here they were received with sincere kindness, and found a momentary rest. Several of the pastors found a home in Holland; at Leyden Leger composed his history of his country. A colony of exiled Vaudois came afterward to America, and settled near Philadelphia; others went to Germany or England. Some, perhaps, remained in the valleys, concealing their faith under a conformity with the Romish rule. And thus, in 1689, seemed forever dissipated that hallowed race, that assembly of the faithful, over whose career in history had ever hung a spotless halo of ideal purity.

In the fearful winter of 1686-87, when the Rhone was frozen to its bed and the Alps were encrusted with ice, the papists drove the surviving remnant of the prisoners over the pre-

¹ Waldensian Researches, Gilly, p. 513.

CHILDREN TORN TO PIECES BY PAPISTS (1655).

citious passes of Mont Cenis. The aged, the sick, women, children, the wounded, and the faint, climbed with unsteady steps the chill waste of snows, and toiled onward toward Protestant Geneva. Many had scarcely clothes to cover them; all were feeble with starvation. The road was marked by the bodies of those that died by the way; the survivors staggered down the Swiss side of the mountains pallid with hunger and cold; some perished as they approached the borders of the friendly territory; others lingered a while, and expired in the homes of the Swiss. But the people of Geneva, as they beheld the melancholy procession approaching their city, rushed out in generous enthusiasm to receive the exiles to their arms. One-half the population went forth on the charitable journey. They contended with each other which should first give shelter to the poorest of the martyrs, and sometimes bore them in their arms from the frontiers to their comfortable dwellings. Geneva, the wonderful city of Calvin and Beza, revived in this period of woe the unbounded benevolence that had marked the early Christians in their conduct toward each other under the persecutions of Maximin and Galerius. As the exiles entered the town they sang the psalm of persecuted Israel, "O God, why hast thou cast us off?" in a grave, sad voice, and breathed out a melancholy wail over the ruin of their apostolic church.¹

An aged man appeared among the throng

who came out to meet them; it was Joshua Janavel, the exiled hero of the Vaudois. For many years Janavel had lived a fugitive at Geneva. Yet the fame of his wonderful exploits had once filled all Europe, and he still kept watch over the destiny of his native land. Had Janavel's advice been followed, the Vaudois believed that their country might yet have been free; had his strong arm not been palsied by age, there would yet remain a hope of its deliverance. In the wild wars that followed the massacre of 1655, when the Marquis of Pianessa was ravaging the valleys, Janavel became the leader of a band of heroes. Born on the mountains, he crept through their passes and sprang from cliff to cliff at the head of his pious company, and waged a holy but relentless warfare with the murderous assailants.¹ With only six soldiers he surprised in a narrow pass a squadron of five hundred, and drove them from the hills. The next day, with seventeen men, he hid among rocks; the enemy approached in force, and pressed into the ambuscade; the crags were rolled upon them; musket-balls rained from every cliff; and as they fled astonished to the valley, the mountaineers, leaping from rock to rock and hiding behind the woodlands, pursued them with fatal aim. The Marquis of Pianessa, the chief of the propaganda at Turin, sent a still larger army against Janavel; he was shut up against the front of a tall cliff, and the Vaudois, with their backs to the

¹ The music of the Vaudois is said to be sad, plaintive, and in a minor tone, as if the reflection of their life and persecution. Gilly, *Researches*, p. 221.

¹ For anecdotes of Janavel see Gilly, *Narrative*, p. 194 *et seq.*

rock, met the advancing foe. The popish army melted away like snow before them; the Christians charged upon them with a cry of faith; and again the enemy were broken with dreadful loss.

Ten thousand men were next marched against the patriots. Meantime their commander, the Marquis of Pianessa, an excellent example of chivalry and feudalism, a bright ornament of his church and court, wrote as follows to the Christian leader: "To Captain Janavel—Your wife and daughter are in my power. If you do not submit they shall be burned alive." Janavel replied: "You can destroy their bodies; you can not harm their beloved souls."¹ The wild war raged all along the mountains. Janavel, and his famous associate, Jahier, beat back the great army of Pianessa, and avenged its terrible atrocities. Among those of the invaders most guilty of indescribable enormities was a band of eight hundred Irish Catholics. They had rejoiced to crush the heads of Protestant infants against the rocks, to hack in pieces gentle matrons and aged men, to fill blazing ovens with unresisting saints. Janavel now came upon them with a dreadful retribution. He surprised them in their barracks, and put them all to death. But Janavel was at last shot through the body; he recovered, and went, in 1680, an exile to Geneva; and here he lived to aid in that remarkable expedition by which the Vaudois were once more restored to their valleys and their homes.

While all Protestant Europe was lamenting the ruin of its oldest church, suddenly there passed before the eyes of men a wonderful achievement—a spectacle of heroism and daring scarcely rivaled at Marathon or Leuctra.² It was named by the exulting Vaudois "The Glorious Return." The exiles at Geneva, tempted by various friendly invitations to emigrate to Protestant lands, still fondly lingered in the neighborhood of their native mountains. No promises of ease and opulence, no prospect of a foreign home, could allure them from the distant view of Mont Cenis and the snow-clad Alps. At length the enthusiastic people, inspired by the brave spirit of the aged Janavel, and their priest and warrior Henry Arnaud, began to entertain the design of invading once more their ancient valleys—of reviving their apostolic church. Yet never was a project apparently more hopeless. The Duke of Savoy, suspecting their design, had extended a chain of garrisons around all the mountain passes. The valleys were held by large armies of French and Savoyards, and a hostile population filled all the towns and hamlets in Perouse, Lucerna, and San Martino. If the exiles attempted to cross the Alps, they must cut their way through a succession of foes. When they reached the

Germanasca and the Pelice they would encounter the united forces of Italy and France.

But Janavel inspired them with his own boundless resolution. An expedition was prepared of nearly one thousand men; and on the night of the 16th of August, 1689, a fleet of boats bore the adventurers over the peaceful waters of Lake Lemman to the borders of Savoy. As they assembled in the forest of Nyon the aged warrior directed them all to kneel in fervent prayer. He could not go with them; he bade them choose, under the guidance of Heaven, a younger leader. It seems that a Captain Turrel was elected their commander.¹ The whole army was divided into nineteen companies; and the Vaudois began their swift march for the passes of the Alps. They evaded or dissipated the hostile garrisons, and swept rapidly up that memorable road by which Hannibal had crossed the unknown mountains. But the Vaudois were no strangers to the icy scene. They chose the most difficult paths to avoid the hostile soldiers, clambered from glacier to glacier, crept along the brink of the fearful precipice, dispersed the enemy by sudden attacks, and reached at length the pass of Mont Cenis. Here they captured the baggage of a Roman cardinal who was on his way to Rome.² Slowly and with unexampled endurance they climbed Mont Cenis, and, as they reached the top, sank, incapable of motion, on the frozen snow. Their path now lay among the wildest and most inaccessible portions of the Alps. With scanty food, but frequent prayers, they pressed over the snows toward their native valleys. Soon their clarions sounded clearly from the summit of Tourliers, as they prepared to descend into the well-known scene and encounter the first shock of battle.

Eight hundred now remained—vigorous, agile, fearless—many of them natives of Lucerna, San Martino, or Angrogna. They descended the snowy hills in a narrow line, wading through deep ravines. Their food was only a few chestnuts and half-frozen water; their dress was torn and comfortless. They slept on wintry crags, but they held fast to their arms and their scanty powder; and their pastor and chief, Henry Arnaud, led them in fervent prayer, every morning and evening, as they clambered down the Alps. At length they approached their beloved valleys; but between lay the ravine of the Dora, crossed by a single bridge. Around was stationed a force of two thousand French, guarding the pass of Salbertrans. The eight hundred saw that they must fight their way across.³ It was a dim and misty night, and as they pressed on the Catholic settlers mocked them with evil tidings. When they asked them for provisions, they replied: "Go on, you will soon have no need of food." They knelt for a few moments, and then began the

IMPALEMENT (1655).

attack. Some one cried out, "The bridge is won!" The Vaudois rushed upon their enemy; the French, terrified by their energy, abandoned their station in sudden panic; and the eight hundred pressed over the bridge and cut down the enemy as they fled. None were spared; and in the dark, bewildering night the French soldiers wandered among the Vaudois, and were shot or sabred without resistance. The moon now rose over the Alps, and disclosed seven hundred dead lying around the dark ravine; of the Vaudois only twenty-two had fallen. Once more they knelt, but it was now in thanksgiving; they heaped together the ammunition they could not use, with all the remains of the French camp, and applied a torch to the pile; the explosion shook the mountains with an unaccustomed tremor, and as the sound died away a wild shout of joy arose from the Vaudois—a cry of "Glory to the God of armies!"

Worn with battle and victory, the exiles still pressed on the same night, often falling down in sleep, and then rousing themselves to climb over rocks and mountains, until, as the sun rose on the Sabbath morning, and the white peaks of the Alps were tinted with a bright rose-color, and the wide, wavy landscape gleamed before them, they saw the fair pinnacles of their own hills and the well-known valley of Pragela. They chanted a poetic prayer of thanksgiving on the mountain-tops, and descended to their home. The priests fled hastily from the valley; the patriots tore the images and the shrines from their ancient churches, and celebrated their simple worship in its accustomed seats. For a

time all was victory. They drove the enemy from the Balsille and its impregnable rocks, expelled the new inhabitants of Bobi, burned hostile Le Perrier, and supplied themselves with arms at the cost of the foe. For food they found a resource in the plunder of French convoys, and in secret stores of corn and nuts which they had hidden in the earth before their expulsion. But the enemy was now chiefly engaged in an attempt to starve them on the mountains. The Duke of Savoy ordered the country to be desolated; the flocks and cattle were driven away from the open valleys, the fruit trees cut down, the harvests burned upon the fields, and the magnificent groves of chestnuts and walnuts despoiled of their autumnal product. The poor Vaudois, clinging to the cliffs and wandering upon the mountain-tops, still baffled the arms of the enemy; but often they had only a few roots to eat, and their manly vigor must slowly melt away in famine and fatigue. Prayer was still their chief support, and among their native crags they constantly lifted their voices to Heaven. For two months they had resisted the attack of twenty thousand men led by the skillful Catinat; but by October 16 it seemed that the enterprise must wholly fail. Their numbers were diminished by desertions and death; many French refugees left them; even Turrel, the commander, despairing of success, fled from them secretly. Clothed in rags, feeding upon roots and herbs, the feeble Vaudois saw before them the approaching winter and the swiftly increasing foe; their prayerful hearts were oppressed with an unaccustomed dread.

Liberty of conscience seemed about to depart forever from the valleys; the Alpine church was never again to rise from its desolation. But Henry Arnaud, pastor and chief, rose, in this moment of danger, to heroic greatness. He, at least, would never abandon his suffering country and the falling cause of freedom. He prayed, exhorted, celebrated the sacred feast in groves of chestnut, fought in the front of his followers, and was ready to die for their preservation.¹ In the midst of his calamities he remembered the counsels of the aged Janavel, who had advised the adventurers, in a moment of extreme need, to take refuge upon the rock of Balsille, and there prolong the contest until help should come from above.

In a wild portion of the valley of San Martino a pile of rock projects over an Alpine torrent, surrounded by huge mountains, accessible only from the bed of the stream below, and rising on three terraces against the sides of its lofty peak behind. It is called the Balsille. Swelled by the winter snows, a branch of the Germanasca sweeps around the singular promontory. A few shrubs cover its top; a little earth produces a scanty vegetation. The Balsille stands like an isolated column, yet on either hand it is commanded by the tall and almost inaccessible peaks of Le Pis and Guinevert. But in that wild and lofty region the climate is severe, the ravines and mountains almost perpetually covered with snow, the paths impassable except to the agile and daring Vaudois. Secluded amidst the wildest scenery of the valleys, the Balsille forms an almost impregnable fortress: the history of its siege and its defense is the crowning wonder of the Glorious Return.

The exiles were now, October 22, 1689, at Rodoret, surrounded by the enemy; to reach the Balsille they must pass through the midst of their foes, over a path that led along the brink of frightful precipices, but which they could only traverse by night. They prayed long and fervently, and then set out in utter darkness. No moon nor stars guided them as they crept on their hands and knees along the edge of the deep abyss. To distinguish their guides they marked them with strips of white cloth or pieces of phosphoric wood.² Yet they passed safely, and in the morning trembled with affright as they saw over what a fearful path they had come. When they reached the Balsille they found only a bare and comfortless rock; they were forced to build at once a fortress and a dwelling; feeble and faint, they labored with incredible toil. They cut down trees, gathered huge stones, and formed seventeen intrenchments, rising one above the other, on the precipitous rock. They dug deep ditches, covered ways, and casemates to secure their lives. On the top of the Balsille they built a

strong fort or castle, the centre of their defenses, surrounded by three high walls; and, to provide their homes in that wintry climate, they dug in the earth and rock of the terraces eighty caves or chambers, where they slept in innocence more calmly, perhaps, than pope or priest.

When they reached the rock they had no food for the next day, and lived upon a few vegetables they gathered in the neighborhood. At length they repaired a dismantled mill, and were enabled to bake bread. With joy and thankful hearts they discovered that the harvests of the last year lay buried beneath the snow in the valley of Pral, and reaped them through the winter by digging in the icy covering. But they were not suffered to remain undisturbed. On the 29th of October they saw the French troops approaching them on all sides; some climbed the precipitous peaks of Guinevert and Col du Pis; others approached the base of the fortified rock; a vigorous attack was made on the intrenchments; the sharp fire of the Vaudois marksmen scattered the enemy with great loss. The Alpine winter now came on; the French troops were driven from the mountains, with frozen limbs and fearful suffering, by the rigorous season; the deep snows of the valleys prevented all military operations, and the enemy withdrew, promising to return in the spring.¹

Winter passed on in peace with the garrison of Balsille. Alone in the midst of a thousand dangers, shielded only by the icy snows, the Alpine church lived on its lonely rock. In his singular castle and temple Henry Arnaud still maintained the ancient ritual of the valleys; twice on each Sabbath he preached to an attentive assembly; morning and evening the voice of prayer and praise ascended to the peaks of Guinevert. The garrison was reduced to about four hundred, all native Vaudois, and their chief solace in their painful life was to join in the hymns and prayers they had learned from their mothers in their childhood.² Yet they would not consent to remain unemployed. Frequent expeditions were sent out to levy contributions on the popish villagers, to climb from crag to crag along the secure mountains and descend in sudden forays into the well-known valleys. They penetrated far down the banks of the Germanasca, and disturbed the repose of Lucerna and Angrogna. Meantime no help came from abroad; the expeditions formed in Switzerland for their relief were intercepted by the enemy; and as the spring drew on, Arnaud and his pious company prepared to engage once more the united armies of France and Savoy.

In April the Marquis De Pareilles sent them offers of liberal terms if they would surrender. A council was held on the rocks, and a unanimous refusal was decided upon. Arnaud wrote to the marquis a defense of his countrymen; he said they had been seated from time im-

¹ Glorious Recovery, p. 133 *et seq.*, describes the Balsille.

HEADS BLOWN OFF WITH POWDER (1655).

memorial in their valleys; that they had paid every impost, performed all the duties of good subjects; that they had led lives of singular purity; that they fought only for self-preservation.¹ On the last day of the month, a Sabbath morning, as Arnaud was preaching to his garrison, the troops of Catinat were seen closing around the solitary fortress. With a rare endurance, scarcely surpassed by the native Vaudois, the French and Savoyards had cut their way through the deep snows of the ravines and climbed the frightful precipices. A whole regiment, amidst blinding sleet and icy winds, had fixed themselves on the pinnacle of Guinevert, overlooking the Balsille. Another appeared on the top of Le Pis, and opened a distant fire on the fort. In the valley in front Catinat ordered a chosen band of five hundred men to climb the steep ascent of the Balsille, and charge the rude intrenchments of the Vaudois.² The French attacked with singular gallantry; they strove to tear away the felled trees behind which their enemy was sheltered, and climbed the rude wall of stone; but a rain of balls came from the Vaudois, a shower of rocks rolled upon the assailants; their ranks were soon broken, and they fled down the hill. Great numbers were slain; the Vaudois leaped from their works, and destroyed nearly all the detachment. Its commander, Colonel De Parat, was wounded and taken prisoner; the next day the Vaudois cut off the heads of their fallen

foes and planted them along the line of their first palisade. It was a symbol of unchanging defiance.

Arnaud defends with vigor the severe policy he had adopted. He killed the prisoners, he says, because it was impossible to hold them; he spared every non-combatant, and never retaliated the cruelties endured by his countrymen. Once more, May 10, the French army, under De Feuquières, gathered around the Balsille. They numbered about thirteen thousand men. A battery of cannon had been placed, with great labor, on the side of Guinevert; the hills around were filled with troops, and the rock itself was surrounded on every side by the hostile forces. The French commander made a last effort to persuade the Vaudois to submit.¹ He offered each man five hundred louis and a free passage from the country; but his great bribes were rejected, and the garrison determined to persist in a vain resistance. With prayers and holy songs they prepared for the final contest. In a first attack the French were repulsed with signal loss. But at length the batteries began to play on the works of the Vaudois, and their feeble fortifications crumbled to the earth. The enemy slowly made their way up the height; the Vaudois were even driven from the castle, and fled to a higher part of the rock; night fell, and the French commander ceased his assault, resolved to capture the whole garrison in the morning.

¹ Glorious Recovery, 159, gives the number of the enemy as 22,000.

² Glorious Recovery, 167.

¹ Glorious Recovery, 175. The French reappear May 10.

Clustered like hunted chamois on the pinnacles of the rock, the Vaudois now sought eagerly for some method of escape.¹ But as yet there seemed no prospect of deliverance. The enemy lay encamped on every side of the Balsille; his watch-fires dispelled the darkness of the night, and sentinels, posted thickly around, closed up every avenue of flight. Arnaud and his brave companions were guarded by a circle of foes who had resolved that no Vaudois should be left alive upon the mountains. But as the night advanced a friendly mist, sent in answer to their prayers, slowly rose from the deep glens and covered the whole valley with a humid veil. The agile mountaineers, led by a skillful guide, crept down the slippery rocks, climbed in single file over the deep chasms of the Germanasca, and reached the base of Guinevert. Here they cut steps in the hardened snow, and, with terrible suffering, dragged themselves on their hands and knees up the steep declivities, until at length they stood on a wide glacier, far above the reach of the enemy. A clamor of thanksgiving arose from the little company as they felt once more that they were free. The morning broke; the French sprang up the hill to seize their certain prey; they found only the bare rock, the empty castle, and hastened, in their rage, to follow the Vaudois along their mountain-path.²

Here, however, they were easily eluded by their active foe. The Vaudois kept upon the loftiest of the mountains, feeding on the foliage of the fir-trees and drinking the half-melted snow. Sometimes they leaped down in fierce forays upon the fertile valleys; often they shot down the invaders from some lofty crag, or swept away the flocks of the Savoyard settlers. Still they hovered fondly over their native scenes, and lingered, with scarcely a hope in the future, above the torrents and the crags they had loved in youth. To their simple and tender hearts these last arduous days must have seemed the saddest and most cheerless of all. From their post on the mountains of Angrogna they might look down into the fairest of the Italian vales; they saw the softly-swelling hills encircle the fertile fields; the laughing torrent; the budding groves of mulberry and chestnut; the grateful gardens around their early homes; the silent churches; and the blossom-covered lawns. But all these they were to enjoy no more. An active foe pursued them from peak to peak, and they must soon fly to their most secret caves.³

But in a moment all was changed, and the Glorious Return was accomplished by a sudden revolution. On the 21st of May, 1690, as Arnaud and his heroes lingered around Angrogna, they learned that the Duke of Savoy had joined the alliance of England and Holland against France. The duke now needed the aid of all his subjects, and the heroic valor of the Vaudois

showed that he had none so worthy as they. He sent a messenger to Arnaud, inviting him to join his service, with his followers, and granting permission to the Vaudois to return to their native valleys.¹ Arnaud obeyed his sovereign; and his soldiers were as active and courageous in the war against the French as they had ever been in defense of their native vales. Soon the exiled Vaudois heard of the happy change, and came in glad troops over the Alps to occupy the homes of their fathers. No hope of gain or prospect of advantage could detain the gentle race in foreign lands. They left their thriving plantations in Brandenburg, their farms in Germany, or their factories in England, and with psalms of triumph hastened to revive their apostolic church in its ancient seat. Lucerna, San Martino, and Prouse were again filled with a rejoicing people; and the lovely landscapes of the sacred vales shone in new beauty, the temples of an untarnished faith.

Such was the Glorious Return. But for the valor of the eight hundred, the wisdom and piety of Henry Arnaud, and the counsels of the aged Janavel, the Vaudois might still have wandered in foreign lands, and their lovely vales have remained in the possession of strangers. But they were now firmly seated in their ancient home, never to be driven from it again. The Jesuits and the popes still plotted their ruin; and when the war was over Victor Amadeus, with his usual bad faith, revived the persecution in the valleys. In 1698 a Jesuit and a number of monks visited all the vales, and made their report to the pope.² In consequence the duke issued a decree expelling all the French Protestants from the country, and forbidding the Vaudois from having any intercourse, on matters of religion, with the subjects of Louis XIV. Three thousand persons were driven from the valleys by this cruel edict. The various disabilities now imposed upon the Vaudois served to render their lives painful, and expose them to the penalties of the hostile courts. They were forbidden to exercise certain professions, to purchase property beyond certain limits, to settle out of their valleys even for trade, to oppose the conversion of their children to Romanism, or to make proselytes themselves. They were held in a kind of bondage, and treated as an inferior race. It was a common practice with the priests of Turin to carry off the children of the Vaudois and educate them in the Romish faith. In 1730 severe instructions were issued against the people of the valleys; and throughout the eighteenth century the church of Rome labored by every art to extirpate its rival church upon the Alps. The Jesuits renewed their activity; the Vaudois were often imprisoned, and their pastors ill-treated. The jealous popes looked with superstitious dread upon the gentle moderators of the blooming valleys.

Nor was this without reason; for as the age

BLAZING OVENS FILLED WITH VAUDOIS (1655-1685).

advanced in liberality the Alpine church became to Italy an example and a teacher. From Pra del Tor had descended, in the Middle Ages, a throng of Vaudois missionaries; in the eighteenth century it was still the centre of advancing thought. Within the circle of the Alps the church flourished with singular vigor. Persecution failed to check its growth; the churches multiplied; the schools increased; the people of the valleys were better educated than those of Turin or Rome. Poor, feeble, an isolated and hated race, shut out from the common privileges of their fellow-subjects, from colleges, schools, hospitals, and the liberal professions, the Vaudois were still a power whose influence was often felt where it was not seen. The people of Turin saw constantly before them the spectacle of a church that never persecuted nor reviled; of a race that steadily advanced in moral and intellectual vigor; of a nation of heroes who had ever defended liberty of conscience when all Italy beside had bowed in servitude to Rome. The Vaudois grew popular with the scholars of Sardinia, with the people, and even with the court. They were still oppressed by unjust laws; yet toward the close of the century a Vaudois church had sprung up at Turin, and the liberal ideas of the valleys were penetrating the north of Italy. The moderators of the Alps became the leaders of an intellectual movement that was destined to spread from Balsille to Tarento.

Yet the only period of real freedom the Vaudois had ever known since the papal usurpations sprang from the conquests of the first Na-

poleon.¹ The impulsive hero was touched by their history, listened to their complaints, and granted them all they required. For the first time, perhaps, since the days of Hildebrand, a perfect religious freedom prevailed in the valleys, and the iron tyranny of Rome and the Jesuits was crushed by the offspring of revolutionary France. A century before, Louis XIV. had nearly secured the destruction of the Alpine church; in 1800 it sprang up into new vigor under the shelter of the French arms. The pastors of the valleys returned Napoleon's favors with sincere gratitude, and lamented his final defeat as that of a friend. It is probable that the unsparing conqueror had no more truthful admirers than the pure and lofty spirits whom he had set free upon their mountains.

With the restoration of 1814-1815, Victor Emanuel IV. came to the throne of Sardinia, and the Vaudois once more sank to the condition of a subjugated race, alien and oppressed. They were known to be advocates of freedom and advance; the pope and the Jesuits again ruled at Turin; the church and state again united to destroy the church of the mountains.² From 1814 to 1848 the Vaudois suffered indignities and deprivations scarcely surpassed in the earlier persecutions. All the ancient oppressive laws were revived. They were forbidden to hold any civil office, to pursue their labors on Catholic festivals, to hold land beyond a certain limit, to make proselytes, or build new churches except in the least favorable locations,

¹ Muston, ii. p. 308 *et seq.*

² *Id.*, ii. 349.

to marry into papist families, or to give, sell, or lend their Bibles to Catholics. Romish missions were established in their midst, and a convent and a church were built at La Tour to complete the conversion of the people. When Dr. Gilly visited the valleys in 1822 he was struck by the beauty of their landscape, the simplicity and purity of the people; he was touched and grieved to find that they still labored under a rule of persecution, and that liberty of conscience, for which they had ever sighed, was still denied them by unforgiving Rome.

But the church of the Alps was now to rise from its desolation, and to shine out with new lustre in the eyes of all Europe. The free principles it had always inculcated, the liberty of conscience it had ever defended, were become the ruling ideas of every cultivated Italian. Turin and Sardinia had learned to look with wonder, admiration, and remorse upon the lovely valleys they had so often desolated, and the innocent people they had so constantly tortured and oppressed. The Sardinian king, Charles Albert, stood at the head of the Italian reformers. He was resolved to give freedom to the Vaudois; to atone, if possible, for the crimes of his ancestors; to make some faint return to the people of the valleys for their long lesson of patience, resignation, and truth. Amidst the acclamations of his subjects, he prepared (1847) to extend freedom of conscience to the churches of the Alps. A patriotic excitement arose in their favor. A petition was drawn up at Turin urging the king to enfranchise the Vaudois and the Jews. Its first signer was the poet, artist, and statesman, the Marquis D'Azeglio; and his name was followed by a long list of professors, lawyers, physicians, and even liberal ecclesiastics and priests. Cheers were given for the Vaudois at public dinners in Pignerol and Turin, and all Piedmont wept over their history and rejoiced in their approaching triumph. On the 17th of February, 1848, the royal decree was issued giving freedom to the valleys.¹

It was received by the simple and generous Vaudois with a limitless gratitude. A thrill of joy ran over the beautiful vales, and Lucerna, San Martino, and Perouse resounded with hymns of thanksgiving upon the return of that stable freedom which had been ravished from them eight centuries ago. In every village there were processions of the young, with banners and patriotic songs; the blue colors of renewed Italy shone on every breast; the gentle race forgot all their injuries and their woes, to mingle freely with their Romish brethren, and to celebrate their victory in unbounded love. At night the wonderful scenery of the valleys was set off by a general illumination. Pignerol glittered with light; St. John and La Tour shone at the opening of the defiles; far up, ascending toward the Alps, every crag and cliff had its bonfire, and the gleam of a thousand lights startled the wild mountains, and flashed

in caves and ravines where Janavel and Henry Arnaud had once hid in perpetual gloom. The snow-clad peaks and the icy torrents glowed in the illumination of freedom. But a still more remarkable spectacle was witnessed at Turin. There for three centuries the Jesuits had labored and waited for the extermination of the Vaudois. In the public square, amidst its splendid palaces, had died a long succession of martyrs, the victims of its priests and kings. In its dreadful dungeons, noisome with disease, thousands of the people of the valleys had pined and wasted away. What unuttered woes had been borne in its prisons for freedom's sake no tongue could tell, no fancy picture. Its convents had been filled with the stolen children of the Vaudois; its stony walls had heard the vain complaints of parents and brothers without relenting. From its gates had issued forth those dreadful crusades, whose throngs of brigands, soldiers, priests, inquisitors were so often let loose upon the valleys to do the work of fiends; from Turin had come the impalers of women, the murderers of children, the Spaniards who flung old men over beetling crags; the Irish who surpassed even the enormities of the Italians; the Jesuits and Franciscans who urged forward the labor of destruction; the nobles and princes, the pillars of chivalry, who looked on and applauded crimes for which Dante could have found no fitting punishment amidst the deepest horrors of his pit.

And now all Turin, repentant and humble, resolved to do honor to the Alpine church. A day of rejoicing had been appointed for liberated Piedmont, and a deputation from the Vaudois was sent to the capital. As they issued from the valleys they were saluted every where with loud *vivas* for "our Vaudois Brothers," for "Liberty of Conscience."¹ The citizens of Turin received them with unbounded hospitality, and the gentle Vaudois took part in the grand procession; they were preceded by a group of young girls clothed in white, adorned with blue girdles, and each bearing a little banner. Six hundred persons composed the Vaudois deputation, the most noted in the stately pageant. To them, as a mark of honorable retribution, was assigned the first place at the head of the procession as it moved through the streets of Turin. The persecuted of a thousand years walked the leaders of Italian freemen. The city rang with cheers for the Vaudois; flowers were showered upon them from the balconies; men rushed from the throng to salute, to embrace the patient mountaineers; even liberal priests cheered them as they went by; the women of Turin smiled upon the daughters of the valleys. Yet, as the Vaudois moved through the squares hallowed by the torments of their early martyrs, beside the prisons where their ancestors had died by thousands, the palaces where Jesuits and princes had often planned their total extirpation, they were amazed at

¹ Muston, ii. p. 391 *et seq.*

¹ Muston, ii. 392.

PRA DEL TOR.

the startling contrast, and listened with grateful hearts to the glad congratulations of the people of Turin.¹ They breathed out a silent thanksgiving, and prayed that the blessing of Heaven might ever rest upon their pleasant native land.

Their modest prayers have been fulfilled. The festival of their liberation was followed by a wave of revolution that swept over all Europe. The Jesuits and the propaganda were banished from Turin; France became suddenly a republic; the pope was exiled from Rome, to be restored only by the French armies to his ancient tyranny; and Italy was for a moment free. If for a time the cloud of war rested over the valleys, yet the victories of Napoleon and the swift triumph of Garibaldi have given freedom to the peninsula, and safety to the Alpine church. To-day Lucerna, Perouse, and San Martino shine forth in perpetual beauty. The torrents gleam through the sweet vales of Angrogna,² and roar against the cliffs of Bal-

sille. In Pra del Tor the citadel of the Vaudois has become a cultured field, and the chestnut groves where Henry Arnaud and his pious soldiers celebrated their holy rites are still rich with abundant fruit; the landscapes of Lucerna glow with the soft products of the Italian clime; in the wilder valleys the avalanche leaps from the snow-clad mountains, the chamois feeds on his icy pastures, the eagle screams around the peaks of Guinevert. To-day the primitive Christians assemble in peace in churches that were founded when Nero began his persecutions, or when Constantine gave rest to the tormented world. The Vaudois moderator gathers around him his humble pastors in their sacred synods, as the elders of the Middle Ages assembled at Pra del Tor. The schools of the Vaudois, from which the Bible has never been excluded since the

dawn of Christianity, flourish with new vigor; their colleges no longer hide in the caverns of Angrogna. The long struggle of centuries has ended, and the gentle people of the valleys have found freedom to worship God.

Thus the moderator of the Alps has triumphed over the persecuting pope of Rome, and liberty of conscience reigns from the valleys to the Sicilian Straits. Yet one dark scene of tyranny still remains—one blot on the fair renown of Italy. In the city of Rome the Jesuits and the pope still rule. Still they point with menacing gestures to the people of the valleys; still they would snatch the Bible from their schools, and crush their consciences with medieval tyranny. In Rome alone persecution for religion's sake still continues; Rome alone, of all European cities, cherishes a shadow of the Inquisition,¹ and still asserts its right to govern the minds of men by brutal force; enthroned by foreign bayonets over a murmuring

¹ Muston, ii. 393. Who would have said, wrote a Vaudois, that we would have seen all this?

² Gilly, Narrative, p. 138, describes the scenery of Angrogna as unmatched in Italy or Switzerland.

¹ See a decree of the Inquisition (1841) directed against heresy in the Papal States with all its ancient severity. Italy in Transition, p. 460, Appendix, with other documents. The *Syllabus* and the *Canons* still defend the use of force in producing religious unity.

people, the vindictive pope proclaims his undying hostility against the wise and the good of every land. But should the Holy Father and the society of Loyola turn their eyes to the Vaudois Alps, they may read their doom-graven on each heaven-piercing peak. There may be seen a spectral company of the hallowed dead writing with shadowy fingers a legend on the rocks; the tiny babe crushed beneath the soldier's heel; the fair mother hewn to pieces on the snow; the old man of ninety burned to

ashes on the fatal pyre. They write: "Whoever shall harm one of these little ones, it were better for him that a millstone had been hanged about his neck and he were drowned in the depths of the sea!"

[NOTE.—The readers of the above article will be interested to know that nine of the illustrations have been copied from the engravings in Leger's "History," printed in 1669, and are therefore nearly contemporary with the events they depict. The two views of scenery are from nature.]

THE OCEAN STEAMER.

THE EMBARKATION.

ONE of the most striking objects of interest to a stranger visiting New York is the ocean steamer. There are thirty or forty of these huge structures, embodying the highest results of naval science and skill yet realized by mankind, that pertain to the port of New York, and connect it directly or indirectly with every important commercial point on the globe. There are lines running to several different ports in England and Scotland—to Germany—to France—to the Isthmus of Darien, where they connect, through the Isthmus, with other lines from Panama to all points on the western coasts of North and South America—to the West Indies, and to Brazil. Sometimes eight or ten of these steamers leave the port on the same day. There are more than a hundred of such vessels, of the first-class, belonging to the different lines; and when we consider that

to bring the cost of a trip out and home—which cost consists only of the coal, the service, and some incidental charges—within twenty-five thousand dollars is considered a proof of good management and economy, we can see that the amount of capital employed, and the extent of the interests involved in this business, are almost incalculable.

The sources of profit for a line of European steamers are three—regular passengers, freights, and emigrants. Different lines depend, in different proportions, on these several elements. Perhaps the line in which the three are most equally and fully represented is that of Williams and Guion. Their line is composed of eight first-class iron steamers, of three thousand tons each, and are celebrated for their sea-going qualities. They carry the United States mails, and are commanded by gentlemen of large ex-

perience in ocean steam navigation. It was the *Minnesota*, one of the ships of this line, which, through the courtesy of Captain Price, her commander, furnished the subjects for the engravings with which this article is illustrated.

One might easily suppose that since the crossing of the Atlantic is the great lion in the way, in the imaginations of so many people, when contemplating a tour in Europe, that the arrangements for the conveyance of travelers and tourists would be made with a view of effecting the passage of the sea at the narrowest part. But this is not so. We go by water for six hundred miles very nearly along the shore—with railroad trains running parallel to our course, not very far distant, and far outstripping the steamer in speed—and do not finally leave the coast till about one-fifth of the distance has been traversed by sea, which might, were it not for certain peculiar considerations of a practical character, have been more rapidly passed over by land.

Many persons are surprised when they learn for the first time how closely a direct line from New York to Liverpool follows the coast until it reaches the point, beyond Newfoundland, where the coast trends to the westward. We are deceived by our maps, which, representing the eastern and western hemispheres on two separate projections, and on opposite pages in the atlas, make it seem as if a direct course to Liverpool would require us to strike out at once, on leaving New York, into the open sea, leaving Halifax and the coasts of Newfoundland far to the westward of us. But the truth is, as will be readily made apparent on connecting New York and Liverpool by means of a thread upon the globe, that a direct line from one of these ports to the other, instead of receding at once widely from the land, passes closely along the coast, cutting off several peninsulas and capes on its way, and at Newfoundland passing through the very heart of the country. So that if in planning a route to Europe for the people of the United States the only things to be taken into consideration were the relative proportions of land and water transportation to be provided for, and the desirableness of making the water passage as short as possible, the plan would have been to go by railroad to some point on the northeastern coast of Newfoundland and there take the steamer for a voyage of something like two thousand miles, instead of one of three thousand miles from New York.

As it is, however, the people of Massachusetts, of Maine, and even of the British provinces, come hundreds of miles by land in a course directly the reverse of that leading to their intended destination, in order to go back again by sea; when all the time they like the cars infinitely better than the ship, as a means of transportation.

The case is a remarkable example of the overpowering influence of commerce to draw into its channels, we might almost say into its vortex, every thing that comes within its reach

or under its influence. At the mouth of the Hudson, and at the confluence of the East River flowing into it from the Sound, are formed vast basins of deep water, well sheltered, where ships of any magnitude, and in any number, may lie anchored in safety. The Hudson River itself forms naturally a straight, deep, and uninterrupted channel of navigation for a hundred and fifty miles into the interior. From the head of this navigation a series of comparatively level plains—composing the region traversed by the Erie Canal—open an easy way into the heart of the continent, to the territory of the lakes and the valley of the Mississippi, and form the only natural opening through the range of highlands which every where else separates the interior from the sea. New York is thus made, by the very configuration of the continent, the great way of entrance and exit for the channels and vehicles of commerce between the Old World and the New. These channels and vehicles have been formed, or, rather, they have opened and formed themselves, under the silent but irresistible influence of the natural conditions which control them. They thrive and prosper spontaneously—every thing being in their favor—while attempts and enterprises aiming at the establishment of similar instrumentalities from other points drag heavily or die. Thus the commerce of North America flows through New York; and since—as has always been the case in every country and in every age—the routes of travel must be mainly those of commerce, the result is that, as a general rule, the traveler who wishes to proceed from almost any point on the North American continent to any other part of the world, in order to go conveniently and comfortably, must go through the New York door.

The scene which presents itself on board a sea-going steamer, in the port of New York, an hour before its departure, is a very interesting one to those who behold it for the first time. Indeed it is invested with a certain romantic charm, which is heightened by there being combined with it in some degree an element of solemnity. One might at first suppose that the spectacle would be very much the same as that afforded by the departure of a river steamer on the Mississippi or the Hudson, or that of a coatwise side-wheel packet leaving Portland for Boston, or Charleston for Savannah. But though there is a certain degree of correspondence in the elements which enter into combination in the two cases, the character of them, and the consequent expression of the whole scene, are entirely changed. The massiveness and solidity of the structure of the ship; the height, thickness, and strength of the bulwarks; the guards placed around the hatchways and companion-ways, speaking ominously of heavy seas breaking over upon the decks; the ponderous forms and prodigious strength of such of the machinery as comes in sight; the capstan, with the heavy wheels and pinions connecting it with the steam-power by which it is worked;

THE MAIN SALOON

THE ENGINEER AT HIS POST.

the immense blocks and tackles appended to the rigging; and even the vast efficiency and force with which the passengers' baggage—a dozen heavy trunks in one slip-noose—are run up by machinery into the air, and then lowered rapidly into the hold—all combine to impress the observer with the conviction that something is in contemplation very different from a moonlight run around Point Judith or the traversing the Tappan Sea. The rough dress and the foreign air of the seamen, and a certain expression of serious earnestness with which they go about their duties, attract strongly the attention of the novice; while the captain, as he comes at last on board, wearing his naval uniform, and his other emblems of authority, and accompanied by his friends and attendants, inspires something like a feeling of awe.

The great saloon, which serves the purpose of parlor, study, dining-room, drawing-room, and even to some extent of invalid-chamber, all in one, for the whole company of passengers during the voyage, suggests, even before the ship leaves the dock, an idea of the heterogeneousness of the purposes to which it is to be appropriated. Near the entrance a group of

young men, with the air of men of business, are taking leave of one of their friends, a passenger, over a bottle of Champagne. Farther in is sometimes to be seen a pale and emaciated lady, out of health, who has perhaps just been brought on board by her husband, and is resting on one of the cushioned settees, supported by pillows and attended by her maid; while she looks around upon the novel scene before her with an expression of countenance in which curiosity and languor, apprehension and hope, are strangely mingled. Other gentlemen and ladies are choosing places at the table, and pinning their cards upon them to mark them as "reserved seats." Here and there a young man making his first voyage is seated at a table, with a portable writing apparatus unfolded before him, and is busily engaged in writing his last farewell to the family circle, or perhaps to some nearer and dearer object of affection. In some still more retired part of the cabin may sometimes be seen an invalid gentleman, who is leaving family and friends on the usually forlorn hope of recovering his failing health by a European tour. His wife comes with him, perhaps, to take leave of him on board, being forbidden by domestic and maternal exigencies from accompanying him on his voyage. You see her struggling bravely to swallow her tears, and to let

her husband carry away the impression of a smile upon her face, as his last recollection of it—if it should unhappily prove to be the last.

As the hour for the departure draws near the crowd increases on the decks and in the cabins until, at length, it becomes difficult to make one's way through the throng. Then comes the sound of the great bell, with the call of the steward, "All ashore!" This brings on the leave-takings—some given in jokes and laughter, and some in silence and tears. When the visitors have withdrawn, and the ponderous bridge connecting the steamer with the pier has been hauled back upon the dock, the officer in command, from his elevated station on the deck, gives, by a touch of his little bell, a signal to the engineer at his station in the engine-room below. The engine awakes at once to life and action, the water at the stern begins to be thrown into a whirlpool of boiling surges, and the vast mass, with its hundreds of occupants, gathered from all parts of the country and brought suddenly into the most close juxtaposition and companionship, begins slowly to creep away from the pier. The parting gun is fired; the waving handkerchiefs from the long

line of passengers leaning over the railing of the promenade deck are answered by similar signals from rows and groups of friends on the pier. The ship glides on with a slow but gradually accelerated motion—the very slowness with which the ponderous mass obeys the impulse urging it forward impressing us the more forcibly with a sense of the 'prodigious momentum of its advance. When, at length, she attains her proper speed, and the spires of the city, the piers, and the vast numbers of ships and steamers that line the shore, or lie at anchor in the stream, show, by the swiftness with which they seem to glide by, that the ship is really under way, the passengers begin to turn their thoughts to themselves and to the ship, with a feeling of relief that the parting scene is over. The groups separate, and the several parties move away to different portions of the ship, wherever their several inclinations or duties call them. Some find comfortable seats on the promenade deck to view the scenery of the harbor, and indulge quietly in the sad and solemn feelings awakened by the first parting from one's native land. Others go to attend to the proper disposition of their trunks and parcels—selecting such as they wish to have conveyed to their state-rooms for use during the voyage; while others repair to their state-rooms, and begin systematically to arrange their affairs, with a view to preparing themselves to meet their coming encounter with the sea in a *horizontal position*, which is for most persons the best posture of defense against that particular enemy.

There is a certain sense of solemnity, heightened by an element of vague and undefined fear, that is perhaps inseparable from that emotion which is always awakened in the mind on first leaving one's native land for a voyage across the Atlantic. And yet, such a voyage is, on the whole, a means of protection and safety for life and health, and not a source of danger. Out of a hundred persons taken at random, if fifty were to remain at home and the other fifty cross the Atlantic occasionally, on voyages to Europe, the fifty travelers, all other things being equal, would, upon an average, live the longest. So true is this that insurers, who have a direct pecuniary interest in the prolongation of the lives of their clients, far from requiring an extra premium on account of any additional risk incurred in such voyages, would rather that the insured would cross the Atlantic for a tour abroad than not—on the ground that the slight danger of disaster by the way is far more than compensated for by the general benefit to the health which is almost sure to result. Let those, therefore, who are deterred from undertaking such a voyage by considerations relating to personal safety, dismiss their apprehensions as idle fears, and go forward bravely to reap the real benefits that lie concealed under the imaginary danger.

It is not surprising, however, that these apprehensions should be felt, and that minds of

a sensitive constitution should be sometimes strongly affected by them, for the hope of benefit to be derived is weakened by diffusion, being spread over months and years, perhaps, of future life; while the danger, such as it is, is concentrated within a period of a few days—even, perhaps, during certain portions of the voyage, within a few hours. Indeed, sometimes when at midnight the scream of the steam-whistle on deck is heard by the sleepless passenger in her berth, indicating that the fog and the darkness without are so dense that the only safeguard from collision with other ships, or with fishermen on the Banks, is in sounding that alarm, and then listening for the response to warn them away, and that against the still more imminent peril of an encounter with an iceberg there is no protection whatever, while yet all the time the steamer is driving on through fogs and mists and flying scuds of rain, and over foaming and surging seas, without the slightest abatement of its usual speed, the danger reaches the highest possible state of concentration; and it is not surprising that the sensitive and the timid are sometimes entirely overpowered by it.

The truth is that, notwithstanding the extraordinary degree of exemption from disaster and calamity which has been attained in the navigation of the northern Atlantic, through the vast advances which have been made in modern times in nautical science and skill, there is probably no other great thoroughfare of commerce or of human intercommunication on the globe so beset with danger and difficulties as the voyage from New York to Liverpool. The Gulf Stream brings a current of warm water fifty miles wide and a thousand feet deep—and flowing at the ordinary rate of the current of a river—from the tropical seas, and pours it out in a vast expanding mass over and beyond the Banks of Newfoundland, where it turns off to the eastward, and finally loses itself in the northern seas; while, to the westward of it, a counter-current coming down from Baffin's Bay—a current of nearly equal magnitude and force—pours into it a stream of icebergs, ice-floes, and ice-cold water. The effects of this confluence are, beneath the water, the accumulation of vast deposits of sand and rocky debris brought down by the ice, and in the atmosphere above an almost perpetual succession of fogs and mists and driving rains, accompanied by gales and squalls, and every other possible meteorological commotion.

The region most disturbed by the conflict between these opposing forces and temperatures is on the hither side the Atlantic, and affects chiefly the first half of the voyage; and the danger, moreover, is the greatest at that season of the year which would on other accounts be the most convenient and the most agreeable time for making the trip—namely, in the early months of summer. The ice-floes break up, and icebergs are detached from the great Greenland glaciers crowding out from the land, in the

TAKING THE PILOT.

early summer of one season; and as they require about a year for their twelve or fifteen hundred miles' voyage, they do not reach the track of the ocean steamers until the early summer of the next. They drift very slowly at last, and melt very gradually under the feeble radiation of even June and July suns in the latitude of Labrador. Some portions both of the floes and of the icebergs reach as far south as the Banks of Newfoundland, but few go much farther south than this. Their advance ceases here, partly because the force of the current by which they are brought down becomes well-nigh exhausted, and partly because the masses of ice become by this time so diminished and so weakened by the increasing heat, both of the latitude and the season, that they are easily beaten to pieces by the waves and dissolved. Sometimes, however, mountains of ice come down of such prodigious size that it is long before they entirely disappear. Captain Price informed us that on one of his voyages he passed two immense icebergs, and on his return voyage, after sailing nearly fifteen hundred miles to and fro, and making the usual stay in port, he passed them again. They had drifted during the interim about forty miles. They had diminished somewhat in size, but they were of such magnitude still, and their forms were so peculiar, that their identity could not be mistaken.

When we consider the dangers and difficulties resulting from all these causes which beset these seas, the iron-bound coasts, the shoals and

submerged rocks which encumber the shores, the fogs, the ice, the tremendous gales characteristic of these latitudes, and the enormous magnitude and force, of the billows which are produced by them, we shall perhaps conclude that the work of producing a structure which will contain one or two thousand beings, and convey them safely—dancing on its way over and through all these terrific commotions—and arrive safely at its destined port, is a very great exploit for so comparatively frail and diminutive a creature as man to perform. And yet the Cunard Company have been sending a constant succession of such steamers between New York and Liverpool now for nearly thirty years, having intrusted them during that time with the conveyance of many hundreds of thousands of passengers, and without the loss thus far of a single life, through any fault or failure on their part, from the exposures and hazards which they have thus encountered. The accomplishment of this result is perhaps to be regarded as the greatest triumph of human science and skill over the forces of nature that the whole history of the dealings of man with the material world records.

If we regard the ship as a living monster forcing its way by its own peculiar organs of locomotion through these billows and storms, we must consider the state-room of the captain as the seat of its *brain*. The duties of the commander of a sea-going steamer are not only extremely various, but they involve the possession of a combination of mental qualities and attain-

ments most diverse in their character, many of them being such as are seldom conferred by nature, and are very difficult of attainment, but which are all absolutely essential to the successful execution of his charge. He must be a good ruler. No monarch can be more absolute than he in the control of every thing on board his ship, from the time of his dismissing the pilot, at the commencement of his voyage, to his taking the pilot at the end of it. He has, however, three different communities to govern, entirely distinct from each other, and involving quite different methods and principles of treatment in the emergencies that occur. There are, first, the company of cabin passengers; secondly, the ship's company, consisting of seamen, engineers, firemen, cooks, and stewards, sometimes amounting to hundreds in number; and, thirdly, the emigrants—a body of men, women, and children, to the number often of more than a thousand. Thus the commander of one of these ships has intrusted to his charge a heterogeneous community of one or two thousand souls: enough to form the population of quite a town. These, all packed together in

the closest quarters, in the ship which he commands, he has the responsibility of conveying through mists and gales and driving storms of snow and rain, breasting the heaviest seas, and threading his tortuous way among tides and currents, and through fleets of fishermen, and among fields and mountains of floating ice, with only a plank between his little world of human hopes and fears and the world of waters, which, when in their angry moods, rage and roar around him, as if eager to make the ship and all its contents their prey. He has to find his way over this pathless deep by means of stars, which are constantly in motion, and by the sun, which on no two days pursues the same track through the skies. The needle of his compass is liable to be disturbed in its indications by many causes. A blow struck upon any portion of his iron ship may derange it; and upon the variation of his chronometer to the amount of the fraction of a second during the voyage the question may depend whether he shall strike upon a rock or enter the port in safety at the end of it. One would suppose that the solicitude and anxiety which would attend the sus-

THE CAPTAIN'S CABIN.

CAPTAIN JAMES PRICE.—[PHOTOGRAPHED BY ROCKWOOD.]

taining of responsibilities like these would be overwhelming. But they are not so. No class of men enjoy better health, or perhaps lead lives of greater freedom from anxiety and care, than these commanders. The reason is, that they are as a class thoroughly qualified for their work; and men do easily what they do well. One of our engravings represents the captain's state-room in the *Minnesota*, with the instruments upon its walls which serve as the ship's organs of sense. There is the barometer, by which she perceives what is the condition of the atmosphere in respect to changes of density and pressure, and so presages coming storms; and the sextant, through which the sun sends in at noon every day a report which determines her exact position on the sphere; and the chronometer, which carries with it the New York or Liverpool time, and shows, by comparison with the time of the ship, the easting or west-

ing that has been made; and a graduated quadrant, with a pendulum attached to it, which indicates the position of the ship upon her keel; and the thermometer, by which the vicinity of ice is made known through the increasing coldness of the water; and many others. All these are, as it were, so many additional organs of sense for the captain—an extension of his perceptive faculties into the water, into the air, and even out to the sun and the stars. When we consider how intimate the acquaintance of this officer must be with the endlessly varied indications of all these instruments, in order to interpret them properly, and the vast amount of minute and special knowledge he must have of the currents and eddies, the rocks and shoals, the aspects of the weather, and even of the customs and usages governing the movements of other vessels that he is liable to meet on his track, we shall see how extended and how com-

plicated, and how different from those of other men, must be the elements of thought with which his mind is stored, and by which it is ordinarily occupied.

In fact, so far from being worn down by the anxieties and responsibilities of their position, the captains of these steamers are chiefly attracted to their work by the dangers and hazards which invest it with peculiar romance. The storms and shipwrecks which fill the mind of landmen with terror, not only have no terrors for the true sailor, the sailor of the highest type, but have actually, strange as it may appear, a positive attraction for him. No exigency is ordinarily able to surprise or daunt him. In fact, he has generally passed through more than one experience of shipwreck as part of his apprenticeship. How ship-captains are educated receives a striking illustration in the career of Captain Price, the senior commander and commodore of the Williams and Guion line.

He was born in Tenby, Pembrokeshire, a famous watering-place of England, in 1820. His parents did not intend him for the sea; but the sea stories of his father, who was a ship-captain, filled him with an enthusiasm for "life on the ocean wave," and despite opposition, he took to the water from a boy. The dangers of this career did not daunt him. "In fact," said he to the writer, "my imagination had been worked up to such a pitch that I thought the greater the danger and the more hazardous the position the greater the glory of a sailor's life." He rapidly worked his way up until he received the command of the ship on which he first embarked. A member of the Methodist Church from early youth, his religious principles and his good wife combined to keep him from those vices to which sailors are supposed to be peculiarly liable. When the Australian trade opened he took charge of a packet, and carried out some of the first gold-diggers. In an-

swer to our question, he told us that he could not tell us how often he had been around the world; but the Cape of Good Hope, New Zealand, and Cape Horn were among the most familiar headlands of his acquaintance. He has been twice shipwrecked, once burned out at sea, once six days and nights upon the ocean in boats, once caught in floating ice, from which he extricated himself with difficulty. Such is the life and such the experiences which fit a man for a captaincy of an ocean steamer between New York and Liverpool, a route at once the most hazardous and the most responsible of any in the world. In a word, the chief officers of these steamers are selected from the very best which the commercial marine of the world can offer; and after such a schooling it is not strange that they witness with perfect composure the rising winds and rolling waves which fill the inexperienced landsman with great but usually causeless alarm.

All is usually peace, contentment, and repose on the decks and in the cabins of the ship while she is gliding over the smooth water of the harbor; but when, at length, she passes the outer forts, and emerging from the Narrows,

THE STATE-ROOM.

THE LADIES' CABIN.

enters upon the swell of the sea, a very large portion of the passengers are compelled to retire to their berths, and for several days the deck and saloons seem well-nigh deserted. The sickness is not occasioned, as is often supposed, by the mechanical effect of the motion of the ship on the digestive organs, as these organs can endure far more violent movements than any produced by the oscillations of the waves without any inconvenience—as, for example, in running, jumping, riding on horseback, and going through the exercises of the gymnasium. The derangement of the system by the motion of the sea is primarily an affection of the brain, the effects upon the other organs being secondary and symptomatic; and the function of the brain through the disturbance of which the morbid action begins is what is called the “instinct of equilibrium.”—that is, the instinct by which the mind, through some hidden action of the brain, takes cognizance of the relation of the body to the perpendicular. That this is an instinct, and not a faculty acquired by observation and habit, is shown by the fact that an infant will stretch its arms to save itself from falling, before it has ever had any experience of the pain produced by a fall.

Now when, as in almost all exercises and motions on land, we are surrounded by objects that are near us and stable, no matter how gentle or how violent our movements may be, while the eye is upon these objects the brain can retain cognizance of its position in respect to the perpendicular in all its motions. But when

there are no fixed objects in view on which the sense of equilibrium can lay hold to steady itself by, as it were—as, for instance; when a person is shut up in a coach, or in a closely-curtained sleigh, or when, on deck at sea, there is nothing but rolling and dancing waves about him—the brain is continually losing its equilibrium, and then recovering it by an effort, and by these efforts it becomes bewildered and fatigued. The first effect is a sense of giddiness in the head, which gradually becomes pain. The digestive organs, and especially the liver, begin soon to be affected, as they almost always are, through sympathy, in case of any injury or morbid action in the brain. But as the nausea and other such affections are only symptomatic of disturbance in certain functions of the brain, any remedies applied to the digestive organs must necessarily fail, as in fact they always do, of producing any thing more than a palliative effect.

The only modes of reaching the origin of the difficulty, *in the brain*, are two—first, by keeping surrounding objects that are fixed and stable in sight, so as to aid the proper organ of the brain in not losing the position of the perpendicular, and secondly, by assuming a horizontal position, so as to diminish the sense, and consequently the effect, of its loss. It is only the latter of these preventives that is available at sea.

On land, however, the former is almost always efficacious. If a lady is “stage sick,” the best remedy is to open the window that she may look out. She often attributes the effect

to the air; but it is probably due, in a great measure, to the aid which the open window affords her for keeping the position of the perpendicular in mind, by means of the fixed objects of the landscape, which are thus brought distinctly into view.

It is on this principle that people are usually more affected by riding in a closed sleigh than in a closed carriage, although the motion is less—for the sleigh is more closely shut up than the carriage, and the surrounding objects are more entirely concealed; whereas, in an *open* sleigh, people are seldom or never made sick. And so in the case of a swing, although the motion is so similar to that of a ship at sea, and a great deal more violent in respect to the rapidity and sometimes to the extent of the oscillations, few people become giddy, since the surrounding objects afford them such facilities for keeping the perpendicular in mind.

At sea, there are no objects to aid in doing this; the rolling and surging billows around the ship, instead of rendering any aid, tend rather to increase the cerebral bewilderment and mental confusion. Where, however, there are objects within the range of vision, by means of which the eye can enable the brain to keep its reckoning, the effect is the same as in the case of a vehicle on land. In crossing the channel from Folkestone to Boulogne, or from Dover to Calais, where the land by day and the lights by night are in sight on one side or on the other during the whole passage, people sometimes keep themselves well by standing on deck, and

steadily watching one shore or the other till the agitated portion of the water is passed. The brain is thus kept duly cognizant of its position, and performs its functions in a regular and healthy manner.

In the open sea, however, no facilities of this kind are at command. Here there is nothing stable but the horizon. It is probable that the view of the horizon, or rather the general impression always present to the mind when on the deck of a ship, of the relative positions and extent of the regions of sky and of sea, may be the real source of much of the relief which is usually ascribed to the freshness of the air. This is the more probable, as in all ocean steamers the most effectual measures are taken for the thorough ventilation of the cabins and state-rooms, and, indeed, for every inhabited portion of the ship.

Whether it is better for a passenger in danger of sea-sickness to remain quietly in his berth and yield his brain without resistance to the disturbing influences acting upon it, until it recovers its self-control by becoming accustomed to the motion, or to force himself upon the deck and there “fight it out” with the enemy in the open air, is a mooted question which will probably never be settled. Indeed, it is possible that there may be different classes of constitutions, rendering one course better in some cases and the other in others. The lines are often drawn very decidedly between the parties advocating these two principles at sea. For a lady who has a brother or a husband to

QUARTER-DECK.

THE GALLEY.

attend upon her, who is not himself sick, or is so self-sacrificing as to give up his own comfort for the sake of promoting hers, and who can consequently have a reclining chair or a mattress placed upon a settee, all nicely arranged for her, and her attendant ready to go and come for her, and provide for every want, it is probably better to be on deck; for here, under these exceptional circumstances, she can have the benefit of the horizontal position, the open air, and effect of the sky and the horizon upon her sensorium combined. But very few of the whole number of passengers can enjoy these advantages, and of gentlemen, except those who are very seriously sick, none. The question, therefore, whether it is better to remain quietly in one's berth or to go on deck and "take the air," depends much on the precise situation in which the party will find himself in the latter case. The condition of a lady lying upon a mattress, or even reclining upon an extending chair, with a pillow under her head and her body and limbs covered with blankets and shawls, is very different from that of her husband who sits by her side upon a camp-stool, with the bleak Atlantic winds whistling about his feet, and no support except some rigid wooden edge or bar against which he is crowded hard by the lurching of the ship at every plunge. Sometimes under such circumstances the gentleman seems to feel inclined to think it more comfortable in the state-room below, while his wife wonders why he wishes to remain shut up in such narrow quarters when it is so much

pleasanter and so much better to be on deck in the open air. If there is any selfishness hidden away, however secretly, in the breast of man or woman, it is pretty sure to find its way out to the surface at sea.

Indeed traveling, in all its forms, is a wonderful means of bringing into action and so exposing to view the hidden traits of character—the bad as well as the good. A young man will get a deeper insight into the temper and disposition, and the real mental constitution and character, of the lady whom he is inclined to choose as his partner for life, by making one voyage to Europe in company with her party, than by half a dozen seasons of association with her in the balls and concerts of a great city. The disabilities resulting from the motion of the sea are, in general, mainly overcome in a few days, and the ship, moreover, by that time is beginning to pass beyond the special domain of fogs, icebergs, and squalls, and to enter upon the broad and deep Atlantic, where there is at least some possibility of serene skies and gentle if not favoring gales.

The passengers then begin to emerge, one by one, from the cabins and state-rooms where they have been concealed. All the available nooks and corners on the decks, where a little shelter can be found from the raw winds, are occupied by convalescent invalids. The seats at the long tables in the great cabin begin to be better filled at least at four of the five daily meals which constitute the system at sea; namely, breakfast, luncheon, dinner, tea, and sup-

per. At the rather brief intervals between these, when the stewards leave the tables free, groups are seen seated at them, some reading, some commencing their journals, some engaged in conversation, with a feeling of leisure and contentment which can nowhere else be so fully enjoyed. The ladies even sometimes bring out their work and establish themselves in cozy corners, where they form charming, though sometimes rather delusive, pictures of domestic industry and thrift.

Those who have not yet quite strength or courage to present themselves in public, make the ladies' cabin their resort—a small apartment, where they feel perfectly free from all the restraints and exactions of ceremony and dress, and can sit, or recline, or lie, as their inclination prompts them, and take their food when and how they please. Their gentlemen friends, such as are both agreeable and good-natured, are admitted to visit them there, to entertain the convalescents with reports of the weather, or the prospects of the voyage, and sometimes to read aloud some narrative or tale from the ship's library.

There are always a few, more slow to recover from the sickness, or more indolent or timid, that still keep to their state-rooms, where they receive the calls of their friends, and even sometimes invite company to dinner.

The cabins and state-rooms of an Atlantic steamer during the latter half of the voyage, when the weather is tolerable, are the scenes generally of a very active and incessant gossip—innocent because it is usually good-natured, and entertaining because it has the field entirely to itself. There is, in fact, nothing else to be done, and nothing to occupy the thoughts, for the mass of the company of passengers, but to inquire about, and talk about, their neighbors. A very large portion, consequently, of the conversation that would be heard by an invisible listener in the various nooks and corners occupied by the different groups, would be found to consist of speculations and surmises, and the communication of intelligence, more or less indirectly obtained, in respect to other groups and parties, and of introductions and other preliminaries to the formation of acquaintanceship between one party and another.

In such a remarkably constituted society, consisting of a body of utter strangers to each other, but thrown by circumstances into the closest domestic intimacy, and exposed, moreover, as they all imagine, to common hardships and a common danger, it is very natural and very excusable that every body should wish to know who every body else is, and why and how they are crossing the Atlantic. The gossip which is developed by this state of things is, we repeat, innocent, for it is good-natured—the sense of a common danger predisposing each one to feel kindly toward the rest. You can not read much at sea, partly because fixing the eyes upon the book tends to bring back the giddy and bewildering sensation in the head,

from which you are just recovering, and also because there is so much going on all around you to distract your attention from the book. You can not without great difficulty *write* at all. There is nothing to be done but to observe your neighbors, and to speculate about them. Is that young lady a bride, or is the gentleman who is with her her brother? Are that elderly gentleman and the pleasing young woman by his side husband and wife, or father and daughter? Is this pompous individual, who enters the dining-saloon with such an air, some mighty general, or a clerk of great personal pretensions, and proud of his first commission to Manchester to make purchases for his house? These speculations, and the inquiries which result from them, which under other circumstances would indicate only an idle curiosity, are very laudable here, since the more the passengers become acquainted with each other, the more agreeably they can make pass the otherwise tedious days.

Thus every body is interested in learning all he can about his neighbors—quietly and unobtrusively, of course, and with all proper caution and reserve. The ladies are aided very much by the stewardesses, who communicate to one party in one state-room what they have learned of another in another. Some of these stewardesses become quite expert in forming their estimates of the relationships and characters and positions of the various parties that come under their observation. One of them on board a Cunard ship gave a lady passenger a rule by which she could always discover, she said, the true state of the case in respect to any couple which she saw together in the saloon. “If the gentleman is very attentive to the lady,” she said; “then they are *going* to be married. If the lady is very attentive to the gentleman, then they have *just been* married. If they do not seem to care any thing about each other at all, then they have been married some time!”

The good woman who gave this sage test was a middle-aged widow, so that besides the facilities for observation which she had enjoyed at sea, she had had opportunity, it seems, by her own experience, to know all about it.

Sometimes very warm friendships result from the acquaintances formed at sea, through the friendly intercourse which takes place among the passengers during the latter part of the voyage—friendships which are often cultivated and cherished through future life. More frequently, however, though the intimacy may become quite close and the attachment quite strong, while the company of passengers remain together, the acquaintance comes abruptly to an end amidst the confusion of the landing at Liverpool, and exists thereafter only as a pleasant recollection, and as one of the elements of the charm with which a prosperous sea voyage is invested in the memory and imagination of all sensible people, when it is once over.

We say all sensible people, for there are people who obstinately persist in occupying their minds exclusively while the voyage is in prog-

FIRE-ROOM.

ress, and their recollections of it when it is past, with the irksome, disagreeable, and disquieting incidents and elements of it, to the exclusion of every thing else. Although the tables are loaded with every luxury that money can procure, and notwithstanding what would be supposed to be the insuperable difficulty of providing a great variety of food for such a number of guests, with the extremely limited and restricted conveniences that can be enjoyed on shipboard, there are always discontented and dissatisfied people to complain of the supplies. A fashionable lady, who considers herself a model of refinement and politeness, will be thrown into a fretful and querulous humor, because the captain's report at noon makes the distance run during the preceding twenty-four hours ten or twenty miles less than she had hoped, and make herself and her party miserable by groaning over the length and tediousness of the voyage. "Madam," said a venerable gentleman—whose age and position entitled him to the privilege of speaking plainly—to such a complainer, "here we are a thousand of us shut up in this wooden box in the

middle of the Atlantic; immense furnaces under our feet, burning with furious fires; a boiler with force pent up in it sufficient to blow us all in an instant in the air; and gales and storms howling about the various regions of the sea, violent enough if they assail us to drive us off our course or send us to the bottom. So long, then, as we are all safe, and are headed toward our port, and are moving on—so long as all the fire is shut up in the furnaces, and all the force held in the machinery, and the winds and seas are not too violent for us to move on steadily through them, we won't utter a word of complaint because we are only going on prosperously at the rate of twelve and a half miles an hour instead of thirteen."

The necessity imposed upon Americans of crossing the Atlantic in order to visit their mother

country and the Old World is, in certain aspects of it at least, a vast additional element of enjoyment for those making this grand tour, for that which would be otherwise a simple and commonplace pleasure is invested by it with a certain character of romance and grandeur which nothing else could impart to it. Crossing the Atlantic is an experience which strikes very deep into the soul, and produces changes in the habits of thought and of association which remain through all future life. Nor does the advantage consist merely in the elements of sublimity involved in the voyage itself. The passage of the Atlantic invests with a portion of its own greatness and dignity the whole subsequent tour. Wherever the American goes in his rambles over Europe—among the Highlands of Scotland, in Paris, on the Rhine, or among the Alps—he carries with him the sense of his vast distance from home, and of the grand old ocean, with all its sublime accessories, that separates him from it; and this adds a mysterious and half hidden but very real charm to all his adventures and to all the wonders that he sees.

THROUGH THE WHEAT.

ONCE, when my heart and I were young,
We wandered, restless, by sea and strand,
And lingered a little space among
The grassy valleys of Switzerland;

Where watchful summits forever frown,
Through blue air slanting, clear and keen,
Wearing proudly their icy crown,
While happy hamlets smile between;

Where rapid torrents rejoicing run,
Leaping the cliffs in strength and pride,
Like snow-white ribbons, in wind and sun,
Fluttering down the mountain-side;

Where smoke-like cloudings of tender blue
Dapple the slopes in sunny spots,
And sweetly change, on a nearer view,
To drifts of fairest forget-me-nots.

Often at eve, when the sun was low,
And the mountain shadows grew dark and vast,
I watched the cottagers, wending slow
Home to rest when their toil was past.

Two walked lovingly, side by side,
Speaking softly, as lovers speak—
He with an air of manly pride,
She with a blush on her sun-browned cheek.

Hand in hand, through the evening red
They went—through the shadows damp and sweet—
Choosing a narrow path that led
On and on through the growing wheat.

Sunset touched him with rosy light,
Sunset brightened her loosened hair—
Poor and plain, they were fair to sight,
For youth and love are forever fair.

And often as sunset charms the air—
For the time and scene are vanished now—
I think of that simple, loving pair,
And wonder whether they kept their vow—

Whether under some mossy roof,
Their wedded spirits serenely blent,
They weave the even warp and woof
Of their quiet lives in calm content;

Or whether they parted in scorn and wrath,
As myriad lovers have done before,
And choosing each a separate path,
Were thence divided for evermore;

Or whether, still, as across the land
The dewy shadows grow damp and sweet,
Perennial lovers, with hand in hand,
They walk, knee-deep, in the growing wheat.

FREDERICK THE GREAT.

FREDERICK'S INTERVIEW WITH VALORI.

VIII.—THE CONQUEST OF SILESIA
ACHIEVED.

AFTER the battle of Mollwitz general Neipperg withdrew the defeated Austrian army to the vicinity of Neisse, where he strongly intrenched himself. Frederick encamped his troops around Brieg, and made vigorous preparations to carry the place by storm. With great energy he pushed forward his works, and in less than three weeks was ready for the assault. On the night of April 26 there was a tempest of extraordinary violence, which was followed, the next night, by a dead calm, a cloudless sky, and a brilliant moon. On both sides of the river Oder, upon which Brieg was situated, there was an open champaign country. Several bridges crossed the river. At a fixed moment two thousand diggers were collected, at appointed stations, divided into twelve equal parties. With the utmost exactness they were equipped with all the necessary implements. These diggers, with spade and pickaxe, and yet

thoroughly armed, were preceded a few yards by covering battalions, who, having stealthily and silently obtained the position assigned to them, were to lie flat upon the ground. Not a gun was to be fired; not a word was to be spoken save in a whisper; not even a pipe was to be lighted. Some engineers were to mark out with a straw rope, just in the rear of the covering party, the line of the first parallel. Every imaginable contingency was provided for, and each man was to attend to his individual duty with the precision of clock-work.

Precisely at midnight all were in silent, rapid motion. The march of half an hour brought them to their appointed stations. The soft and sandy soil was easily shoveled. Every man plied pick and spade with intensest energy. As the town clock of Brieg struck one they had so far dug themselves in as to be quite sheltered from the fire of the hostile batteries, should the guns open upon them. Before the dawn of day they had two batteries, of twenty-five

guns each, in position, and several mortars ready for action.

Thus far the enemy had no suspicion of the movement. But now the sun was rising; and, almost simultaneously, on both sides, the roar of battle commenced. The positions had been so adroitly taken as to bring three Prussian guns to bear upon each gun of the Austrians. The Prussian gunners, drilled to the utmost possible accuracy and precision of fire, poured into the city a terrific tempest of shot and shells. Every thing had been so carefully arranged that, for six days and nights, with scarcely a moment's intermission, the doomed city was assailed with such a tornado of cannonading and bombardment as earth had seldom, if ever, witnessed before.

The city took fire in many places; magazines were consumed; the ducal palace was wrapped in flames. Nearly fifteen thousand cannon-balls, and over two thousand bombs, were hurled crashing through the thronged dwellings. Many of the Austrian guns were silenced. General Piccolomini, who was intrusted with the defense of the place, could stand it no longer. On the 4th of May he raised above the walls the white flag of surrender. The gallant general was treated magnanimously. He was invited to dine with Frederick, and, with the garrison, was permitted to retire to Neisse, pledged not to serve against the Prussians for two years. The town had been nearly demolished by the war-tempest which had beat so fiercely upon it. Frederick immediately commenced repairing the ruins and strengthening the fortifications.

All Europe was thrown into commotion by this bold and successful invasion of Silesia. France was delighted, for Prussia was weakening Austria. England was alarmed. The weakening of Austria was strengthening France, England's dreaded rival. And Hanover was menaced by the Prussian army at Götten, under the old Dessauer. The British parliament voted an additional subsidy of £300,000 to Maria Theresa. Two hundred thousand had already been granted her. This, in all, amounted to the sum of two million five hundred thousand dollars. Envoys from all the nations of Europe were sent to Frederick's encampment at Strehlen, in the vicinity of Brieg. Some were sent seeking his alliance, some with terms of compromise, and all to watch his proceedings. The young king was not only acquiring the territory which he sought, but seemed to be gaining that renown which he had so eagerly coveted. He did not feel strong enough to make an immediate attack upon the Austrian army, which general Neipperg held, in an almost impregnable position, behind the ramparts of Neisse. For two months he remained at Strehlen, making vigorous preparations for future movements, and his mind much engrossed with diplomatic intrigues. Strehlen is a pretty little town, nestled among the hills, about twenty-five miles west of Brieg, and thirty north-west of Neisse. The troops were mainly en-

camped in tents on the fields around. The ambassadors from the great monarchies of Europe were generally sumptuously lodged in Strehlen, or in Breslau, which was a beautiful city about thirty miles north of Strehlen. Baron Bielfeld, in the following terms, describes the luxury in which the Spanish minister indulged:

"Each of these ministers makes a most brilliant figure, and never have I seen one travel with more ease and convenience, more elegance and grandeur, than does the marquis of Montijo. Wherever he stops to dine or sup he finds a room hung with the richest tapestry, and the floor covered with Turkey carpets, with velvet chairs, and every other kind of convenience; a table sumptuously served, the choicest wines, and a dessert of fruit and confectionery that Paris itself could not excel. This kind of enchantment, this real miracle in Germany, is performed by means of three baggage-wagons, of which two always go before the ambassador, and carry with them every thing necessary for his reception. When they arrive in some poor village, the domestics that accompany each wagon immediately clear and clean some chamber, fix the tapestry by rings to the walls, cover the floor with carpets, and furnish the kitchen and cellar with every kind of necessary."¹

Speaking of Frederick at this time, Bielfeld says: "Notwithstanding all the fatigues of war, the king is in perfect health, and more gay and pleasant than ever. All who approach his majesty meet with a most gracious reception. In the midst of his camp, and at the head of sixty thousand Prussians, our monarch appears to me with a new and superior air of greatness."

Circumstances had already rendered Frederick one of the most important personages in Europe. He could ally himself with France, and humble Austria; or he could ally himself with England and Austria, and crush France. All the lesser lights in the continental firmament circulated around these central luminaries. Consequently Frederick was enabled to take a conspicuous part in all the diplomatic intrigues which were then agitating the courts of Europe.

On the 7th of May, three days after the capture of Brieg, lord Hyndford, the English ambassador, arrived at the camp of Frederick, and obtained an audience with his majesty. It was eleven o'clock in the forenoon. He gave his government a very minute narrative of the interview. The following particulars, gleaned from that narrative, will interest the reader. It will be remembered that Frederick cherished a strong antipathy against his uncle, George II. of England.

Lord Hyndford commenced his communication by assuring his majesty of the friendly feelings and good wishes of the English government. Frederick listened with much impatience, and soon interrupted him, exclaiming, passionately:

¹ Monsieur le baron Bielfeld, *Lettres Familiales et Autres*, tome i. p. 3.

FREDERICK AND THE BRITISH MINISTERS.

"How is it possible, my lord, to believe things so contradictory? It is mighty fine, all this that you now tell me, on the part of the king of England. But how does it correspond to his last speech in parliament, and with the doings of his ministers at Petersburg and at the Hague, to stir up allies against me? I have reason to doubt the sincerity of the king of England. Perhaps he means to amuse me. But" (with an oath)¹ "he is mistaken. I will risk every thing rather than abate the least of my pretensions."

¹ "Some men," says a quaint writer, "have a God to swear by, though they have none to pray to."

Lord Hyndford, evidently embarrassed, for the facts were strongly against him, endeavored, in some additional remarks, to assume ignorance of any unfriendly action on the part of the British government. The king again, in a loud and angry tone, replied:

"My lord, there seems to be a contradiction in all this. The king of England, in his letter, tells me you are instructed as to every thing. And yet you pretend ignorance. But I am perfectly informed of all. And I should not be surprised if, after all these fine words, you should receive some strong letter or resolution for me." Then, turning to his secretary, he

added, sarcastically, "Write down that my lord would be surprised to receive such instruction."

Lord Hyndford, who says that by this rude assaillment he was put extremely upon his guard, rejoined :

"Europe is under the necessity of taking some speedy resolution, things are in such a state of crisis. Like a fever in a human body, got to such a height that quinquina becomes necessary. Shall we apply to Vienna, your majesty?"

A transient smile flitted across the king's countenance. Then, looking cold again, he added, "Follow your own will in that."

"Would your majesty," lord Hyndford replied, "engage to stand by his excellency Götter's original offer at Vienna on your part? That is, would you agree, in consideration of the surrender to you of Lower Silesia and Breslau, to assist the queen of Austria, with all your troops, for the maintenance of the Pragmatic Sanction, and to vote for the grand duke Francis as emperor?"

"Yes," was the monosyllabic reply.

"What was the sum of money your majesty then offered the queen of Austria?" lord Hyndford inquired.

The king hesitated, as though he had forgotten. But his secretary answered, "Three million florins (\$1,500,000)."

"I should not value the money," the king added. "If money would content her I would give more."

After a long pause lord Hyndford inquired, "Would your majesty consent to an armistice?"

"Yes," Frederick replied; "but for not less than six months" (counting on his fingers from May to December), "till December 1. The season then would be so far gone that they could do nothing."

As the secretary, Podewils, had been taking notes, lord Hyndford requested permission to look at them, that he might see that no mistake had been made. The king assented; and then lord Hyndford bowed himself out. Thus ended the audience.

A few days after this interview, the Dutch ambassador, general Ginckel, arrived with the Resolution from the English and Dutch courts, demanding that the king should evacuate Silesia. Lord Hyndford was much embarrassed, apprehending that the presentation of the summons at that time would work only mischief. He persuaded general Ginckel to delay the presentation until he could send a courier to England for instructions. In a fortnight the courier returned with the order that the Resolution was immediately to be presented to his Prussian majesty.

In the mean time Frederick, who kept himself thoroughly informed of all these events, signed secretly on the 5th of June a treaty of intimate alliance with France. Though he had not yet received the Joint Resolution of the English and Dutch courts, he was well aware of its existence, and the next day sent

to his envoy, M. Räsfield, at the Hague, the following dispatch :

"You will beforehand inform the high mightinesses in regard to that Advice of April 24, which they determined on giving me, through his excellency general Ginckel, along with his excellency lord Hyndford, that such advice can be considered by me only as a blind complaisance to the court of Vienna's improper urgencies. That for certain I will not quit Silesia till my claims be satisfied. And the longer I am forced to continue warning for them here, the higher they will rise."

The plan of France, as conceived and pushed resolutely forward by the count of Belleisle, the renowned minister of Louis XV., was to divide Germany into four small kingdoms, of about equal power, Bavaria, Saxony, Prussia, and Austria. The king of Bavaria, as one of the protégés of France, was to be chosen emperor of Germany. To accomplish this Austria was to be reduced to a second-rate power by despoiling the young queen Maria Theresa of large portions of her territory, and annexing the provinces wrested from her to the petty states of Prussia, Bavaria, and Saxony, thus sinking Austria to an equality with them. France, the grand nation, would then be indisputably the leading power in Europe. By bribery, intimidation, and inciting one kingdom against another, the court of Versailles could control the policy of the whole continent. Magnificent as was this plan, many circumstances seemed now combining to render it feasible. The king of Prussia, inspired simply by the desire of enlarging his kingdom, by making war against Austria, and striving to wrest Silesia from the realms of Maria Theresa, was co-operating, in the most effectual way possible, to further the designs of France. And it had now also become a matter of great moment to Frederick that he should secure the alliance of the court of Versailles.

All the courts of Europe were involved in these intrigues, which led to minor complications which it would be in vain now to attempt to unravel. In the secret treaty into which Frederick entered with France on the 5th of June, 1741, the count of Belleisle engaged, in behalf of his master Louis XV., to incite Sweden to declare war against Russia, that the semi-barbaric power of the north, just beginning to emerge into greatness, might be so occupied as not to be able to render any assistance to Austria. France also agreed to guarantee Lower Silesia, with Breslau, to Frederick, and to send two armies, of forty thousand men each, one across the Upper and the other across the Lower Rhine, to co-operate with his Prussian majesty. The forty thousand men on the Upper Rhine were to take position in the vicinity of the electorate of Hanover, which belonged to George II. of England, prepared to act immediately in concert with the Prussian army at Götten under the "Old Dessauer," in seizing Hanover resistlessly, should England make the slightest move to-

ward sending troops to the aid of Maria Theresa.

The prospects of Maria Theresa seemed now quite desperate. We know not that history records a more inglorious act than that Europe should have thus combined to take advantage of the youth and inexperience of this young queen, weeping over the grave of her father, and trembling in view of her own approaching hour of anguish, by wresting from her the inheritance which had descended to her from her ancestors. France and Germany, inspired by the most intense motives of selfish ambition, were to fall upon her, while the most effectual precautions were adopted to prevent Russia and England from coming to her aid.

In carrying forward these intrigues at the camp of Frederick, the count of Belleisle had an associate minister in the embassy, M. De Valori. A slight incident occurred in connection with this minister which would indicate, in the view of most persons, that Frederick did not cherish a very high sense of honor. M. Valori was admitted to an audience with his Prussian majesty. During the interview, as the French minister drew his hand from his pocket, he accidentally dropped a note upon the floor. Frederick perceiving it slyly placed his foot upon it. As soon as the minister had bowed himself out, Frederick eagerly seized the note and read it. It contained some secret instructions to M. Valori from the French court, directing him not to give Glatz to his Prussian majesty if it could possibly be avoided. Frederick did not perceive any thing ignoble in this act of his, for he records it himself;¹ neither does Mr. Carlyle condemn him.² Most readers will probably regard it as highly dishonorable.

On the 8th of June the English and Dutch ministers, not yet aware of the alliance into which Frederick had entered with France, presented the joint resolution of their two courts, exhorting Frederick to withdraw his army from Silesia. Lord Hyndford, who was somewhat annoyed by the apparent impolicy of the measure, just at that time, solicited and obtained a private audience with the king, hoping by apologies and explanations to make the summons a little less unpalatable to his majesty. In the brief interview which ensued lord Hyndford appealed to the magnanimity of the king, declaring that it would be generous and noble for him to accept moderate terms from Austria. The king angrily interrupted him, saying:

"My lord, do not talk to me of magnanimity. A prince ought in the first place to consult his interest. I am not opposed to peace. But I expect to have four duchies given me."

Maria Theresa was much encouraged by the

subsidy she had received from England. She was not yet informed of the formidable alliance into which France, with a portion of Germany, had entered for her destruction. About the 20th of June she left Vienna for Presburg, in Hungary, a drive of about fifty miles. Here, on the 25th of June, 1741, she was crowned queen of Hungary. She was a very beautiful woman in person, devout in spirit, and those who admire manly developments in the female character must regard her as presenting the highest type of womanhood. She merits the following beautiful tribute to her worth from the pen of Carlyle:

"As to the brave young queen of Hungary, my admiration goes with that of all the world. Not in the language of flattery, but of evident fact, the royal qualities abound in that high young lady. Had they left the world, and grown to mere costume elsewhere, you might find certain of them again here. Most brave, high and pious minded; beautiful too, and radiant with good-nature, though of temper that will easily catch fire; there is, perhaps, no nobler woman then living. And she fronts the roaring elements in a truly grand, feminine manner, as if Heaven itself and the voice of Duty called her. 'The inheritances which my fathers left me, we will not part with these. Death if it so must be, but not dishonor.'

"This, for the present, is her method of looking at the matter; this magnanimous, heroic, and occasionally somewhat female one. Her husband, the grand duke, an inert but good-tempered, well-conditioned duke, after his sort, goes with her. Now, as always, he follows loyally his wife's lead, never she his. Wife being intrinsically as well as extrinsically the better man, what other can he do?"

The ceremony of coronation was attended, near Presburg on the 25th of June, with much semi-bárbaric splendor, as the Iron Crown¹ of St. Stephen was placed upon the pale, beautiful brow of the young wife and mother. All the renowned chivalry of Hungary were assembled upon that field. They came in gorgeous costume, with embroidered banners, and accompanied by imposing retinues. At the close of the ceremonies the queen, who was distinguished as a bold rider, mounted a swift charger, and, followed by a long retinue of Magyar warriors, galloped to the top of a small eminence artificially constructed for the occasion, called the Königsburg, or King's Hill, where she drew her sword, and flourishing it toward the four quarters of the heavens, bade defiance to any adversary who should venture to question her claims. The knightly warriors who crowded the plain flashed their swords in the sunlight, as with one accord, with chivalric devotion, they vowed fidelity to their queen.

¹ *Œuvres de Frédéric*, t. xi. p. 90.

² "Valori was one night with him, and, on rising to take leave, the fat hand, sticking probably in the big waistcoat pocket, twitched out a little diplomatic-looking Note, which Frederick, with gentle adroitness (permissible in such circumstances), set his foot upon, till Valori himself had bowed himself out."—CARLYLE, vol. iii. p. 330

¹ *The Iron Crown*. It was so called because there was entwined amidst its priceless gems and exquisitely wrought frosted gold some iron wire, said to be drawn from one of the spikes which had been driven through one of the hands of our Saviour.

THE QUEEN'S APPEAL TO THE HUNGARIAN NOBLES.

Gradually the secret treaty which allied France, Bavaria, and Prussia, and it was not known how many other minor powers, against Austria, came to light. Two French armies of fifty thousand men each were on the march to act in co-operation with Frederick. England, trembling from fear of the loss of Hanover, dared not move. The Aulic Council at Vienna, in a panic, "fell back into their chairs like dead men." The ruin of Maria Theresa and the fatal dismemberment of Austria seemed inevitable.

Under these circumstances the young queen, urged by her council and by the English court, very reluctantly consented to propose terms of compromise to Frederick. Sir Thomas Robin-

son, subsequently earl of Grantham, was sent from Vienna to Breslau to confer with the British minister there, lord Hyndford, and with him to visit Frederick, at his camp at Strehlen, in the attempt to adjust the difficulties. The curious interview which ensued has been minutely described by sir Thomas Robinson. It took place under the royal canvas-tent of his Prussian majesty, at 11 o'clock A.M. of the 7th of August, 1741.

The two English gentlemen, stout, burly, florid men, were dressed in the gorgeous court costume of those days. Each wore a large, frizzled, powdered wig. Their shirts were heavily ruffled in the bosoms and at the wrists. Their

coats of antique cut were covered with embroidery of gold-lace. Their waistcoats hung down in deep flaps, and large buckles adorned their shoes.

Frederick was a trig, slender young man of twenty-nine years. He was dressed in a closely-fitting blue coat, with buff breeches and high cavalry boots. He wore a plumed hat, which he courteously raised as the ambassadors entered his tent. The scene which ensued was substantially as follows, omitting those passages which were of no permanent interest. After sundry preliminary remarks, sir Thomas Robinson said:

"I am authorized to offer your majesty two million guilders [\$1,000,000], if your majesty will consent to relinquish this enterprise and retire from Silesia."

"Retire from Silesia!" exclaimed the king, vehemently. "And for money? Do you take me for a beggar? Retire from Silesia, in the conquest of which I have expended so much blood and treasure! No, Sir, no. That is not to be thought of. If you have no better proposals to suggest, it is not worth while talking."

Sir Thomas, somewhat discomposed, apologetically intimated that that was not all that he had to offer.

"Very well," said the king, impatiently; "let us see then what there is more."

"I am permitted," the ambassador said, "to offer your majesty the whole of Austrian Guelderland. It lies contiguous to your majesty's possessions in the Rhine country. It will be a very important addition to those possessions. I am permitted to say the whole of Austrian Guelderland."

"What do you mean?" exclaimed the king, with an air of real or affected surprise. Then turning to his secretary, M. Podewils, he inquired, "How much of Guelderland is theirs, and not ours already?"

"Almost none," M. Podewils replied.

Here the king quite lost his temper. In a loud tone and with angry gesticulation he exclaimed, "Do you offer me such rags and rubbish, such paltry scrapings, for all my just claims in Silesia?" And so he ran on for quite a length of time, with ever-increasing violence, fanning himself into a flame of indignation.

"His contempt," writes sir Thomas in his narrative, "was so great, and was expressed in such violent terms, that now, if ever, was the time to make the last effort. A moment longer was not to be lost, to hinder the king from dismissing us."

"I am also permitted, Sire," said sir Thomas, "to add the duchy of Limburg. It is a duchy of great wealth and resources, so valuable that the elector palatine was willing to give in exchange for it the whole duchy of Berg."

"It is inconceivable to me," Frederick replied, "how Austria should dare to think of such a proposal. Limburg! Are there not solemn engagements upon Austria which render

every inch of ground in the Netherlands inalienable?"

"These engagements," said sir Thomas, "are good as against the French, your majesty. But the Barrier treaty, confirmed at Utrecht, was for our benefit and that of Holland."

"That is your interpretation," said Frederick. "But the French assert that it was an arrangement made in their favor."

"Your majesty," sir Thomas rejoined, "by a little engineering art, could render Limburg impregnable to the French or any others."

"I have not the least desire," the king replied, "to aggrandize myself in those parts, or to spend money in fortifying there. It would be useless to me. Am I not fortifying Brieg and Glogau? These are enough for one who wishes to live well with his neighbors. Neither the Dutch nor the French have offended me; nor will I offend them by acquisitions in the Netherlands. Besides, who would guarantee them?"

"The proposal," sir Thomas replied, "is to give guarantees at once."

"Guarantees!" exclaimed the king, scornfully. "Who minds or keeps guarantees in this age? Has not France guaranteed the Pragmatic Sanction? Has not England? Why do you not all fly to the queen's succor?"

Sir Thomas, who was not aware of the engagement into which the allies had entered to keep Russia busy by a war with Sweden, intimated that there were powers which might yet come to the rescue of the queen, and mentioned Russia as one.

The king, with a very complaisant smile, said, "Russia; my good Sir. It is not proper for me to explain myself, but I have means to keep the Russians employed."

"Russia," added sir Thomas, with some stateliness of utterance, "is not the only power which has engagements with Austria, and which must keep them too; so that however averse to a breach—"

Here the king interrupted him, and with scornful gesture, "laying his finger on his nose," and in loud tones, exclaimed:

"No threats, Sir, if you please, no threats."

Lord Hyndford here came to the rescue of his colleague, and said, meekly, "I am sure his excellency had no such meaning, Sire. His excellency will advance nothing so very contrary to his instructions."

Sir Thomas Robinson added, "Sire, I am not talking of what this power or that means to do, but of what will come of itself. To prophesy is not to threaten, Sire. It is my zeal for the public good which brought me here, and—"

Again the king interrupted him, saying, "The public will be much obliged to you, Sir! But hear me. With respect to Russia, you know how matters stand. From the king of Poland I have nothing to fear. As for the king of England, he is my relation. If he do not attack me, I shall not him. If he do attack me, the prince of Anhalt, with my army at Götten, will take care of him."

THE KING APPROACHING SCHNELLENDORF.

"It is the common rumor now," sir Thomas replied, "that your majesty, after the 12th of August, will join the French. Sire, I venture to hope not. Austria prefers your friendship; but if your majesty disdain Austria's advances, what is it to do? Austria must throw itself entirely into the hands of France, and endeavor to outbid your majesty."

This was a very serious suggestion. None of these sovereigns professed to be influenced by any other considerations than their own interests. And it was manifest that Austria could easily outbid Prussia, if determined to purchase the French alliance. For a moment the king was silent, apparently somewhat perplexed. He then said:

"I am at the head of an army which has already vanquished the enemy, and which is ready to meet the enemy again. The country which alone I desire is already conquered and securely held. This is all I want. I now have it. I will and must keep it. Shall I be bought out of this country? Never! I will sooner perish in it with all my troops. With what face shall I meet my ancestors if I abandon my right which they have transmitted to me? My first enterprise, and to be given up lightly?"

"Have I need of peace? Let those who need it give me what I want, or let them fight me again and be beaten again. Have they not given whole kingdoms to Spain? And to me they can not spare a few trifling principalities. If the queen do not now grant me all I require, I shall, in four weeks, demand four principalities

more. I now demand the whole of Lower Silesia, Breslau included. With that answer you can return to Vienna."

"With that answer!" sir Thomas replied, in tones of surprise. "Is your majesty serious? Is that your majesty's deliberate answer?"

"Yes, I say," the king rejoined. "That is my answer, and I will never give any other."

Both of the English ministers, in much agitation, spoke together. The king, impatiently interrupting them, said:

"Gentlemen, gentlemen, it is of no use to think about it."

Taking off his hat, he slightly saluted them, and retired behind the curtain into the interior tent.

A brief account of this interview has been given by Frederick,¹ and also a very minute narrative by sir Thomas Robinson, in his official report to his government. There is no essential discrepancy between the two statements. Frederick alludes rather contemptuously to the pompous airs of sir Thomas, saying that "he negotiated in a wordy, high, droning way, as if he were speaking in parliament." Mr. Carlyle seems to be entirely in sympathy with Frederick in his invasion of Silesia. The reader will peruse with interest his graphic, characteristic comments upon this interview:

"The unsuccessfullest negotiation well imaginable by a public man. Strehlen, Monday, 7th

¹ *Œuvres de Frédéric*, ii. p. 84.

August, 1741—Frederick has vanished into the interior of his tent, and the two Diplomatic gentlemen, the wind struck out of them in this manner, remain gazing at one another. Here, truly, is a young, royal gentleman that knows his own mind, while so many do not. Unspeakable imbroglío of negotiations, mostly insane, welters over all the earth; the Belleisles, the Aulic Councils, the British Georges, heaping coil upon coil; and here, notably in that now so extremely sordid murk of wiggeries, inane diplomacies, and solemn deliriums, dark now and obsolete to all creatures, steps forth one little Human Figure, with something of sanity in it, like a star, like a gleam of steel, sheering asunder your big balloons, and letting out their diplomatic hydrogen. Salutes with his hat, 'Gentlemen, gentlemen, it is of no use!' and vanishes into the interior of his tent."

The next day the two British ministers dined with Frederick. The king was in reality, or assumed to be, in exultant spirits. He joked and bantered his guests even upon those great issues which were threatening to deluge Europe in blood. As they took leave, intending to return to Vienna, through Neisse, which was held by the Austrian army, the king said to sir Thomas Robinson, derisively:

"As you pass through Neisse, please present my compliments to marshal Neipperg; and you can say, your excellency, that I hope to have the pleasure of calling upon him one of these days."

It seemed to be the policy of Frederick to assume a very trifling, care-for-nothing air, as though he were engaged in very harmless child's play. He threw out jokes, and wrote ludicrous letters to M. Jordan and M. Algarotti. But behind this exterior disguise it is manifest that all the energies of his soul were aroused, and that, with sleepless vigilance, he was watching every event, and providing for every possible emergence.

It will be remembered that Breslau, whose inhabitants were mainly Protestant, and which was one of the so-called free cities of Germany, was surrendered to Frederick under peculiar conditions. It was to remain, in its internal government, in all respects exactly as it had been, with the simple exception that it was to recognize the sovereignty of Prussia instead of that of Austria. Its strict neutrality was to be respected. It was to be protected by its own garrison. No Prussian soldier could enter with any weapons but side-arms. The king himself, in entering the city, could be accompanied only by thirty guards.

When under the sovereignty of Austria, though the Protestants were not persecuted, very decided favor was shown to the Catholics. But the influence of Protestant Prussia was to place both parties on a perfect equality. This greatly annoyed the Catholics. Certain Catholic ladies of rank, with a few leading citizens, entered into a secret society, and kept the court of Vienna informed of every thing which trans-

pired in Breslau. They also entered into intimate communication with general Neipperg, entreating him to come to their rescue. They assured him that if he would suddenly appear before their gates with his army, or with a strong detachment, the conspiring Catholics would open the gates, and he could rush in and take possession of the city.

But the ever-vigilant Frederick had smuggled a "false sister" into the society of the Catholic ladies, who kept him informed of every measure that was proposed. At the very hour when Frederick was dining with the two English ministers, and making himself so merry with jests and banter, he was aware that general Neipperg, with the whole Austrian army, was crossing the river Neisse, on the march, by a route thirty miles west of his encampment, to take Breslau by surprise. But he had already adopted effectual measures to thwart their plans.

On the 10th of August there was a magnificent review of the Prussian army on the plain of Strehlin, to which all the foreign-embassadors were invited. During the night of the 9th general Schwerin and prince Leopold, with eight thousand Prussian troops, horse and foot, arrived in the southwestern suburbs of Breslau, and, at six o'clock in the morning, demanded simply a passage through the city for their regiments and baggage, on the march to attack a marauding band of the Austrians on the other side of the Oder.

The rule, in such cases, was that a certain number of companies were to be admitted at a time. The gate was then to be closed until they had marched through the city and out at the opposite gate. After this another detachment was admitted, and so on, until all had passed through. But general Schwerin so contrived it, by stratagem, as to crowd in a whole regiment at once. Instead of marching through the city, to the surprise of the inhabitants, he directed his steps to the market-place, where he encamped and took possession of the city, admitting the remainder of his regiments. In an hour and a half the whole thing was done; and the city was strongly garrisoned by Prussian troops. The majority of the inhabitants, being Protestant, were well pleased, and received the achievement with laughter. Many cheers resounded through the streets, with shouts of "Frederick and Silesia forever." All the foreign ministers in Breslau, and the magistrates of the city, had been lured to Strehlin to witness the grand review.

Frederick had caused signal cannon to be placed at suitable points between Breslau and Strehlin, which, by transmitting reports, should give him as early intelligence as possible of the success of the enterprise. About noon, in the midst of the grand manœuvres on the parade-ground, one distant cannon-shot was heard, to the great satisfaction of Frederick, who alone understood its significance.

General Neipperg had advanced as far as Baumgarten when he heard of this entire cir-

cumvention of his plans. Exasperated by the discomfiture, he pushed boldly forward to seize Schweidnitz, where Frederick had a large magazine, which was supposed not to be very strongly protected. But the vigilant Frederick here again thwarted the Austrian general. Either anticipating the movement, or receiving immediate information of it, he had thrown out some strong columns to Reichenbach, where they so effectually intrenched themselves as to bar, beyond all hope of passage, the road to Schweidnitz. General Neipperg had advanced but half a day's march from Baumgarten when he heard of this. He ordered a halt, and retraced his steps as far as Frankenstein, where he had a very strongly intrenched camp.

Frederick soon followed the Austrians with his whole army, hoping to bring them to a decisive battle. But general Neipperg was conscious that he was unable to cope with the Prussian army in the open field. For a week there was manœuvring and counter-manœuvring with great skill on both sides, general Neipperg baffling all the endeavors of Frederick to bring him to a general action.

At length Frederick, weary of these unavailing efforts, dashed off in rapid march toward the river Neisse, and with his van-guard, on the 11th of September, crossed the river at the little town of Woitz, a few miles above the city. The river was speedily spanned with his pontoon bridges. As the whole army hurried forward to effect the passage, Frederick, to his surprise, found the Austrian army directly before him, occupying a position from which it could not be forced, and where it could not be turned. For two days Frederick very earnestly surveyed the region, and then, recrossing the river and gathering in his pontoons, passed rapidly down the stream on the left or northern bank, and, after a brief encampment of a few days, crossed the river fifteen miles below the city. He then threw his army into the rear of Neipperg's, so as to cut off his communications and his daily convoys of food. He thus got possession again of Oppeln, of the strong castle of Friedland, and of the country generally between the Oder and the Neisse rivers.

General Neipperg cautiously advanced toward him, and encamped in the vicinity of Steinau—the same Steinau which but a few weeks before had been laid in ashes as the Prussian troops passed through it. The two armies were now separated from each other but by an interval of about five miles. The country was flat, and it was not probable that the contest which Frederick so eagerly sought could long be avoided.

Affairs were now assuming throughout Europe a very threatening aspect. The two French armies, of forty thousand each, had already crossed the Rhine to join their German allies in the war against Austria. One of these armies, to be commanded by Belleisle, had crossed the river about thirty miles below Stras-

bourg to unite with the elector of Bavaria's troops and march upon Vienna. The other army, under Maillebois, had crossed the Lower Rhine a few miles below Düsseldorf. Its mission was, as we have mentioned, to encamp upon the frontiers of Hanover, prepared to invade that province in co-operation with the Prussian troops in the camp at Götting, should the king of England venture to raise a hand in behalf of Austria. It was also in position to attack and overwhelm Holland, England's only ally, should that power manifest the slightest opposition to the designs of Prussia and France. At the same time Sweden, on the 4th of August, had declared war against Russia, so that no help could come to Austria from that quarter. Great diplomatic ability had been displayed in guarding every point in these complicated measures. The French minister, Belleisle, was probably the prominent agent in these wide-spread combinations.¹

The queen, Maria Theresa, still remained at Presburg, in her Hungarian kingdom. The Aulic Council was with her. On the 15th of August sir Thomas Robinson had returned to Presburg with the intelligence of his unsuccessful mission, and of the unrelenting determination of Frederick to prosecute the war with the utmost vigor unless Silesia were surrendered to him.

These tidings struck the Austrian council with consternation. The French armies were declared to be the finest that had ever taken the field. The Prussian army, in stolid bravery and perfection of discipline, had never been surpassed. Germany was to be cut into four equal parts, and France was to be the sovereign power on the continent.

In this terrible emergence the queen, resolute as she was, was almost compelled, by the importunity of her counselors, to permit sir Thomas Robinson, who was acting for England far more than for Austria, to go back to Frederick with the offer so humiliating to her, that she would surrender to him one half of Silesia if he would withdraw his armies and enter into an alliance with her against the French. The high-spirited queen wrung her hands in anguish as she assented to this decision, exclaiming, passionately:

"If these terms are not accepted within a fortnight, I will not be bound by them."

Sir Thomas hastened back to Breslau, and anxiously entered in communication with lord

¹ "Sure enough, the Sea Powers are checkmated now. Let them make the least attempt in favor of the Queen if they dare. Holland can be overrun from Osnabrück quarter at a day's warning. Little George has his Hanoverians, his subsidized Hessians, Danes, in Hanover; his English on Lexden Heath. Let him come one step over the marches, Maillebois and the Old Dessauer swallow him. It is a surprising stroke of theatrical-practical Art, brought about, to old Fleury's sorrow, by the genius of Belleisle, and they say of Madame Châteauroux; enough to strike certain Governing Persons breathless for some time, and denotes that the Universal Hurricane, or World Tornado, has broken out."—CARLYLE, vol. iii. p. 357.

Hyndford. The British minister entreated the king to admit sir Thomas to another interview, assuring him that he came with new and more liberal propositions for a compromise. The king replied, in substance, with his customary brusqueness:

"I will not see him. I wish to listen to no more of his offers. The sooner he takes himself away the better."

Sir Thomas, deeply chagrined, hastened back to Presburg. Acting in behalf of the English cabinet, he trembled in view of the preponderance of the French court, and of the loss of Hanover. With the most impassioned earnestness he entreated the queen to yield to the demands of Frederick, and thus secure his alliance.

"High madam," he said, fervently, "at this crisis, alliance with Frederick is salvation to Austria. His continued hostility is utter ruin. England can not help your majesty. The slightest endeavor would cause the loss of Hanover."

Thus pressed by England, and with equal earnestness by her own Aulic Council, the queen again yielded, though almost frantic with grief, and consented to surrender the whole of lower Silesia to Frederick if he would become her ally. As Frederick had offered these terms, it was supposed of course that he would accept them. Sir Thomas was again dispatched, at the top of his speed, to convey them to the camp of Frederick. But the repulse of the king was peremptory and decisive. To lord Hyndford, soliciting an audience for the envoy, he replied:

"I will not see him. There was a time when I would have listened to a compromise. That time has passed. I have now entered into arrangements with France. Talk to me no more."

Sir Thomas hastened back to Presburg in despair. Feeling the "game was up," and that there was no more hope, he asked permission to return home. The British cabinet was in a state of consternation. France, the dreaded rival of England, was attaining almost sovereign power over the continent of Europe. Frederick himself was uneasy. He had sufficient penetration to be fully aware that he was aiding to create a resistless power, which might, by-and-by, crush him. Sir Thomas, in a state of great agitation, which was manifest in his disordered style, wrote from Presburg to lord Hyndford at Breslau, as follows. The letter was dated September 8, 1741.

"My lord, I could desire your lordship to summon up, if it were necessary, the spirit of all your lordship's instructions, and the sense of the king, of the parliament, and of the whole British nation. It is upon this great moment that depends the fate, not of the house of Austria, not of the empire, but of the house of Brunswick, of Great Britain, of all Europe. I verily believe the king of Prussia himself does not know the extent of the present danger. With whatever motive he may act, there is not one, not that of the wildest resentment, that

can blind him to this degree—of himself perishing in the ruin he is bringing upon others. With his concurrence the French will, in less than six weeks, be masters of the German empire. The weak elector of Bavaria is but their instrument. Prague and Vienna may, and probably will, be taken in that short time. Will even the king of Prussia himself be reserved to the last?"

These considerations probably weighed heavily upon the mind of Frederick. For, after having so peremptorily repulsed the queen's messenger, he sent, on the 9th of September, colonel Goltz with a proposition to lord Hyndford, which was substantially the same which the queen in her anguish had consented to make. The strictest secrecy was enjoined upon colonel Goltz. The proposition was read from a paper without signature, and was probably in the king's handwriting, for lord Hyndford was not permitted to see the paper. He took a copy from dictation, which was as follows:

"The whole of Lower Silesia; the river Neisse for the boundary; the city of Neisse for us, as also Glutz; on the other side of the Oder the ancient boundary, between the duchies of Brieg and Oppeln. Namslau for us. The affairs of religion in *statu quo*. No dependence upon Bohemia. Cession eternal. In exchange we will go no farther. We will besiege Neisse for form. The commandant shall surrender and depart. We will quietly go into winter-quarters; and they (the Austrians) can take their army where they will. Let all be finished in twelve days."

But Frederick did not seem to think himself at all bound, by his treaty obligations with France, to refrain from entering into secret arrangements with the foe which would promote his interests, however antagonistic those arrangements might be to his assumed obligations. He was the ally of France in the attempt to wrest territory from the young queen of Austria, and to weaken her power. His armies and those of France were acting in co-operation. Frederick now proposed to the common enemy that, if Silesia were surrendered to him, he would no longer act in co-operation with his ally. But that France might not discover his perfidy, he would still pretend to make war. The Austrians were to amuse themselves in defending Neisse from a sham siege until the pleasant weeks of autumn were gone, and then they were to march, with all their guns and ammunition, south to Vienna, there to fight the French. Frederick, still assuming that he was the ally of France, was to avail himself of the excuse that the season of ice and snow was at hand, and withdraw into winter-quarters. Such, in general, were the terms which Frederick authorized his minister, Goltz, to propose to lord Hyndford, as the agent of England and Austria.

Most of our readers will pronounce this to be as unwarrantable an act of perfidy as history has recorded. But in justice to Frederick we ought to state that there are those who, while

admitting all these facts, do not condemn him for his course. It is surprising to see how different are the opinions which intelligent men can form upon the same actions. Mr. Carlyle writes, in reference to these events:

"Magnanimous I can by no means call Frederick to his allies and neighbors, nor even superstitiously veracious in this business. But he thoroughly understands, he alone, what just thing he wants out of it, and what an enormous wigged mendacity it is he has got to deal with. For the rest, he is at the gaming-table with these sharpers, their dice all cogged, and he knows it, and ought to profit by his knowledge of it, and in short to win his stake out of that foul, weltering melley, and go home safe with it if he can."

While these scenes of war and intrigue were transpiring, no one knowing what alarming developments any day might present, Vienna was thrown into a state of terror, in apprehension of the immediate approach of a French army to open upon it all the horrors of a bombardment. The citizens were called out *en masse* to work upon the fortifications. The court fled to Presburg, in Hungary. The national archives were hurried off to Grätz. The royal family was dispersed. There were but six thousand troops in the city. General Neipperg, with nearly the whole Austrian army, was a hundred and fifty miles distant to the north, on the banks of the Neisse. The queen, on the 10th of September, assembled at Presburg the Hungarian parliament, consisting almost exclusively of chivalric nobles renowned in war. The queen appeared before them with her husband, the grand duke Francis, by her side, and with a nurse attending, holding her infant son and heir. Addressing them in Latin, in a brief, pathetic speech, she said:

"I am abandoned by all. Hostile invasion threatens the kingdom of Hungary, our person, our children, our crown. I have no resource but in your fidelity and valor. I invoke the ancient Hungarian virtue to rise swiftly and save me."

The queen was radiantly beautiful in form and features. Her eyes were filled with tears. The scene and the words roused the zeal of these wild Magyar warriors to the highest pitch. They drew their sabres, flourished them over their heads, and with united voice shouted, *Moriamur pro nostro rege, Maria Theresa*—"Let us die for our king, Maria Theresa." "They always," writes Voltaire, "give the title of king to their queen. In fact, no princess ever better deserved that title."

Between the two camps of the Austrians and Prussians, south of the river Neisse, there was a castle called Little Schnellendorf, belonging to count Von Steinberg. It was a very retired retreat, far from observation. Arrangements were made for a secret meeting there between Frederick and general Neipperg, to adjust the details of their plot. It was of the utmost importance that the perfidious measure should be concealed from France. The French minister,

MAP OF THE SECOND SILESIAN CAMPAIGN.

Valori, was in the Prussian camp, watching every movement with an eagle eye. "Frederick," writes Carlyle, "knows that the French are false to him. He by no means intends to be romantically true to them, and that they also know."

On Monday morning, the 9th of October, the British minister, lord Hyndford, accompanied by general Neipperg and general Lentulus from the Austrian camp, repaired to this castle, ostensibly to fix some cartel for the exchange of prisoners. Frederick rode out that morning with general Goltz, assuming that he was going to visit some of his outposts. In leaving, he said to the French minister Valori, "I am afraid that I shall not be home to dinner." At the same time, to occupy the attention of M. Valori, he was invited to dine with prince Leopold. By circuitous and unfrequented paths the king and his companion hied to the castle.

Frederick cautiously refused to sign his name to any paper. Verbally, he agreed that in one week from that time, on the 16th, general Neipperg should have liberty to retire to the south through the mountains, unmolested save by sham attacks in his rear. A small garrison was to be left in Neisse. After maintaining a sham siege for a fortnight, they were to surrender the city. Sham hostilities, to deceive the French, were to be continued until the year was out, and then a treaty was to be signed and ratified.

His majesty pledged his *word of honor* that he would fulfill these obligations; but declared that should the slightest intimation of the agreement leak out, so that the French should discover it, he would deny the whole thing, and

refuse in any way to be bound by it. This was assented to.

At the close of the business the king, who had been exceedingly courteous during the whole interview, took general Neipperg aside, and beckoning lord Hyndford to join them, said, addressing lord Hyndford:

"I wish you too, my lord, to hear every word I speak to general Neipperg. His Britannic majesty knows, or should know, my intentions never were to do him hurt; but only to take care of myself. And pray inform him that I have ordered my army in Brandenburg to go into winter-quarters, and break up that camp at Götting."

The reader will bear in mind that the camp at Götting, menacing Hanover, was acting in co-operation with Frederick's ally, France, and that forty thousand men had been sent from France to the aid of those Prussian troops. Frederick now, entering into secret treaty with the enemy, while still feigning to be true to his ally, was perfidiously withdrawing his troops so as to leave the French unsupported. His treachery went even farther than this. In the presence of lord Hyndford, the representative of England, he informed the Austrian general minutely how he could, to the greatest advantage, attack the French.

"Join," said he, "the Austrian force under prince Lobkowitz in Bohemia. Fall immediately and impetuously upon the French, before they can combine their forces to resist you. If you succeed in this, perhaps I will by-and-by join you; if you fail—well, you know every one must look out for himself."

The audacious duplicity of this ambitious young king was still more conspicuously developed by his entering into a secret correspondence with the court of Austria, through certain generals in the Austrian army. And that he might the more effectually disguise his treachery from his allies, the French, he requested lord Hyndford to write dispatches to various courts—to Presburg, to England, to Dresden—complaining that Frederick was *deaf to all proposals; that nothing could influence him to enter into terms of reconciliation with Austria*. It was to be so arranged that the couriers carrying these dispatches of falsehood should be captured by the French, so that these documents should be carried to the French court.

And in addition to all this, the more effectually to hoodwink the eagle eyes of the French minister in the Prussian camp, M. Valori, the following stratagem was arranged. The king was to invite M. Valori to dine with him. While at the table, merry over their wine, a courier was to arrive, and with trumpet blast announce dispatches for the king. They were to be delivered to the king at the table. He was to open them before Valori, to find that they consisted of a bitter complaint and remonstrance, on the part of the British minister, that the king was inflexible in repelling all advances toward an amicable adjustment of their

difficulties, that unrelentingly he persisted in co-operating with France in her warfare against Austria. All this farce took place according to the programme. M. Valori was effectually deceived.

Some of our readers may think that the above narrative is quite incredible: that a young sovereign, who had just written the *Anti-Machiavel*, and who knew that the eyes of the world were upon him, could not be guilty of such perfidy. But, unhappily, there is no possible room for doubt. The documentary evidence is ample. There is no contradictory testimony.

General Neipperg, in his account of the interview, writes, in reference to Frederick: "He is a very spirited young king. He will not stand contradiction; but a great deal may be made of him if you seem to adopt his ideas, and humor him in a delicate, dextrous way. He did not in the least hide his engagements with France, Bavaria, Saxony. But he would really, so far as I could judge, prefer friendship with Austria on the given terms. He seems to have a kind of pique at Saxony, and manifests no favor for the French and their plans."

Mr. Carlyle, who, with wonderful accuracy, and with impartiality which no one will call in question, has recorded the facts in Frederick's career, gives the story as it is here told. In the following terms Mr. Carlyle comments upon these events:

"Of the political morality of this game of fast-and-loose what have we to say, except that the dice on both sides seem to be loaded; that logic might be chopped upon it forever; that a candid mind will settle what degree of wisdom (which is always essentially veracity) and what of folly (which is always falsity) there was in Frederick and the others; whether, or to what degree, there was a better course open to Frederick in the circumstances; and, in fine, it will have to be granted that you can not work in pitch and keep hands evidently clean. Frederick has got into the enchanted wilderness populous with devils and their work, alas! It will be long before he get out of it again; *his* life waning toward night before he get victoriously out, and bequeath his conquest to luckier successors!"

On the 16th of November general Neipperg broke up his camp at Neisse, according to the arrangement, and leaving a small garrison in the city, to encounter the sham siege, defiled through the mountains on the south into Moravia. The Prussians, pretending to pursue, hung upon his rear for a short distance, making as much noise and inflicting as little harm as possible. General Neipperg pressed rapidly on to Vienna, where he was exultingly welcomed to aid in defending the city menaced by the French.

Frederick on the 17th, the day after the departure of the Austrian army, invested Neisse. He had an embarrassing part to play. He was to conduct a sham siege in the presence of M. Valori, who was not only a man of ability, but who possessed much military intelligence.

Feigning the utmost zeal, Frederick opened his trenches, and ostentatiously manœuvred his troops. He sent the young prince Leopold, with fifteen thousand horse and foot, into the Glatz country, many leagues to the east, to guard against surprise from an enemy, where no enemy was to be found. He marked out his parallels, sent imperious summonses for surrender, and dispatched reconnoitring parties abroad. M. Valori began to be surprised—amazed. "What does all this mean?" he said to himself. "They have great need of some good engineers here."

With that vigilant eye upon him, Frederick was compelled to some vigor of action. On the night of October 17 he commenced the bombardment. The noise was terrific. It could not be prevented but that the shot and shell should do some harm. Some buildings were burned; several lives were lost. M. Valori, who knew that the result could not be doubtful, was induced to go to Breslau and await the surrender. After the garrison had made apparently a gallant resistance, and Frederick had achieved apparent prodigies of valor, the city was surrendered on the 31st of October. Most of the garrison immediately enlisted in the Prussian service.

Thus the last fortress in Silesia fell into the hands of Frederick. There was no longer any foe left in the province to dispute his acquisition. He took possession of Neisse on the 1st of November, celebrating his victory with illuminations and all the approved demonstrations of public rejoicing.

On the 4th of November he returned to Breslau, entering the city with great military display. Seated in a splendid carriage, he was drawn through the streets by eight cream-colored horses. Taking his seat upon the ancient ducal throne, he was crowned, with great ceremonial pomp, sovereign duke of Lower Silesia. Four hundred of the notables of the dukedom, in gala dresses, and taking oaths of homage, contributed to the imposing effect of the spectacle. Illuminations, balls, and popular festivities in great variety, closed the triumph.

On the morning of the 9th of November Frederick set out for Berlin, visiting Glogau by the way. On the 11th he entered Berlin, where he was received by the whole population with enthusiastic demonstrations of joy. For a short time he probably thought that through guile he had triumphed, and that his troubles were now at an end. But such victories, under the providence of God, are always of short duration. Frederick soon found that his troubles had but just begun. He had entered upon a career of toil, care, and peril, from which he was to have no escape until he was ready to sink into his grave.

But a few days after his return, lord Hyndford, who had followed the king to Berlin, met his majesty in one of the apartments of the palace. Frederick, struggling to conceal the emotions with which he was agitated, said to him,

"My lord, the court of Vienna has entirely divulged our secret. The dowager empress has acquainted the court of Bavaria with it. Wasner, the Austrian minister at Paris, has communicated it to the French minister, Fleury. The Austrian minister at St. Petersburg, M. Linzendorf, has told the court of Russia of it. Sir Thomas Robinson has divulged it to the court of Dresden. Several members of the British government have talked about it publicly."

Frederick immediately and publicly denied that he had ever entered into any such arrangement with Austria, and declared the whole story to be a mere fabrication. Having by the stratagem obtained Neisse, and delivered Silesia from the presence of the Austrian army, he assured the French of his unchanging fidelity to their interests, and with renewed vigor commenced co-operating with them in the furtherance of some new ambitious plans.

"ME AND MY SON."

MRS. CALTON mused beside the fire. "Mechanical piety might be of value to me, or that which this novel illustrates—a chaotic piety; if one *could* have the patience to feel or speak stuff with the cheerful heroine, who is driven from all material happiness with a sharp stick. *She* says, 'It is enough to be close to things—you haven't time to live 'em all. To know all about it is to have it. I think it's easy for the angels to be happy, so; they know. It's easiest of all for God.' Either way to get from myself!"

Mrs. Calton tossed the book from her, being restless as well as reflective, and looked out of the window. It was a gusty November day, more dismal without than within, and she turned away to throw herself upon the sofa—to sleep, perchance to dream, or any thing else which chance might turn up. She was alone in the house, mistress of it, for Mr. Calton had gone the way of the earth more than a year ago. If grief is to be measured by one's toilet, Mrs. Calton's was modified; bits of violet peeped among her sables, rosettes on her little shoes, knots of ribbon in her black hair, and an amethyst ornament here and there. She was handsome, though her eyes were gray to greenishness, her hair so dense that it rose in waves round her forehead, and her mouth so large that "prunes, prisms, and Peru" could not draw it up; so full too of dazzling teeth that an enemy might remember what Elia says—"The fine lady or fine gentleman who show me their teeth, show me bones."

She laughed little now, for she had fallen upon weary days. Not for the first time, poor girl!

"Yes," continuing her reflections, "beads to count, a formula to repeat day after day, would absorb the hours. As it is, 'nothing gives an echo to the throne where hope is seated.' The arches of the cathedral, the pipes of the organ, the joints of the knees are mechan-

ical; but in space, sound, and attitude they suggest and invoke the unknown and desired."

Mrs. Calton was interrupted. Her quest for the light never seen on land or sea was delayed. The interruption appeared nothing more than a morning call; but an earthquake could not have been more effective, so far as the changing of her mood went. This opportunity gives her biographer a chance at narrative.

Laura Calton, at this date, between the vague twenties and thirties, was born of "gentle" parents, owners of a nail factory, members of a Congregational church, and the centre of a circle as like themselves as one pea is like another. If Laura's mother had a tea-party in August, the neighbors, one after the other, gave the same early in September. If Laura's father, from his money a little in advance of the community, had his barn painted a new shade, or his carriage lining changed, Mr. Allen or Mr. Perkins followed suit, in a cheaper fashion. It was a very respectable town; an excellent one to be born in, and perhaps a still better one to be buried in. The infants and the dead alone were safe in the bare individuality of human nature. Nobody disputed nor governed *their* way; they would come into the world and go out of it upon a mysterious principle which no opinion could disturb. Laura being a girl of some force and originality, kicked in the orthodox walking-stool provided for her by her guardians and friends; even her good mother thought her queer, and no example to follow; and her indulgent father was often obliged, using his own expression, "to wink" at her. Ostracized people, whatever their acts or aims, are never quite happy, and Laura's girlhood was not satisfactory. The curious comprehension of children which some parents show, Laura was a victim to. If she said "yes," they said "no," from a sense of duty; if she asked for twenty-five cents for a doll's tea-set, they gave her twenty cents to buy a watering-pot to water the cucumbers in the garden with. The fine moral instinct, said to be innate, was much twisted in Laura's mind. She was never allowed to be a law to herself, and nobody explained why she should follow laws that were originated by somebody else. Consequently, she was a child of "ups and downs," possessed by Satan, or on the point of being blest, to use her mother's vernacular. When she grew up she was still variable, "as the shade by the light quivering aspen made;" her leaves were either turned inside out to wind and sun, or glittered darkly through mists and showers. She was not loved, but sought for more than any young lady in the county. Neither lilies nor roses sprang up in her footsteps, but the ribbon snakes of envy and detraction; and this fact closed her heart to the manifold springs of mercy, charity, and tenderness. No inner life was developed, and her outward life was cold and empty. At an early age she discovered that her dolls were stuffed with bran;

later, that the worm was in every bud, and rose-bugs eating into every flower. At twenty what ennui possessed her! Full of latent abilities, not a single one had been called into play. Mr. John Calton appeared upon the stage in the nick of time—for himself; in midsummer, her dullest period, when Nature promises all to the senses, but gives nothing. The world's tired denizen, or a child of nature, Thoreau or Emerson, would have delighted in the season and the scene; but Laura had no soul for nature, no sentiment which every "common sight appars in celestial light," no dream of that relation between the seen and the unseen, which brings us glimpses of "that immortal sea which brought us thither." The brilliant July sky was a tiresome spectacle to her; she watched it from vacancy. The sovereign summer clouds, solid in base and apex a moment, boiling like yeasty waves and vanishing up the burning ether, or spreading snowy tufts and plumes across the zenith, or rising like walled cities of towers and palaces, were not as much in her mind as the baseless fabric of a dream. She knew also that the sea rolled before the town; but its plaintive monotone, its fitful roar, the tides, the changing atmosphere and motion, the eternal waste and distance of old ocean "poured round" the world, so congenial to the melancholy and profound in feeling, stirred no mental echo in Laura's spirit. The woods, the meadows, never drew her to themselves; the sprites and elves of the secret landscape, hid in moss, fern, and shrub, never showed their faces to her. Life was dull then without human contact and contest, which belongs to the crowd. What made ordinary people contented, she wondered—those who read no novels, had few new dresses, and never came across attractive men? Must she see those white clouds eternally rise in the north, and the white horses in the bay forever chase each other? Was it her doom to walk up and down Maine Street for the rest of her life, to see that Cummings had a peck of clams outside his door, or a basket of cocoa-nuts, or, on the bench at Beggs's Emporium, Tom Frost and Jem Cole smoking, and disputing whether the wind was hauling round, and what the minister "went on" to say the Sabbath before? Must she look out of the window to see Daddy Cox gee and haw his oxen, Mrs. Mortmain skurrying to Mothers' Prayer-meeting, and Mrs. Bond toddling along with eggs and blue yarn to sell, and various other tinkers?

"Oh, mother," she cried, "what is to become of me these weary days? It is everlasting between sunrise and sunset. Oh, mother, how can you be so satisfied? I hate this whole place, and every identical thing in it."

Laura "harried" her mother with these questions one afternoon, when there was not even an old novel nor magazine in the house; when the mail had arrived, bringing her no letter; when she found no article to fix over in her wardrobe; when she had looked in the glass as long as she possibly could, and had finished a

neat toilet—all for nothing and nobody! The mother was in her own bedroom down stairs, engaged in darning stockings. The house was so still from garret to cellar—it being the interval between dinner and supper—that the buzz of every individual fly was quite trumpet-like. The fat weed on Lethe's wharf was in a lively situation in comparison. Now and then a curtain flapped on the south side of the house, for the sea-breeze was stirring.

"Laura," answered her mother, in a phlegmatic way, "it would be better for you if you were the daughter of a poorer man."

"Why don't father fail then," answered Miss, pertly. "You often say that you and father live for my advantage."

Laura tipped herself back in her rocking-chair, and her mother instantly discovered that she had an old pair of stockings on her pretty feet.

"Laura," she said, sharply, "why don't you wear those open-work stockings I bought you in Ledford the other day? What is the use of buying expensive things if you won't wear them, I should like to know?"

Laura laughed.

"How about the poor man's daughter, mother?"

Then the mother laughed too. She was a kindly woman, embedded in her beliefs, and rather overlaid with ideas of duty, but, in the main, spirited enough to excuse many of Laura's extravagant notions. She owned two selves—one was hers; the other belonged to her church, her circle, and to that mystical relation which she called her obligations. Alas! Laura did not discover the nature nearest her own till it was too late.

The door of the sitting-room opened with a bang, and Laura saw her father, Mr. Lewis, coming in with a strange gentleman.

"Mother, where are you?" called Mr. Lewis, pulling up the shades.

Mrs. Lewis hurried in, followed by Laura.

"Wife," said Mr. Lewis, with dignity, "I introduce you to Mr. Calton, from New York. He has come to buy nails of us. I expect he has hit *the* nail on the head. Ha! He likes the looks of our place so much that he calculates he'll stop a day or two in our midst. This is my daughter Laura, Sir; my only child, Sir. Don't apologize, mother, but I hope you can scare up something for supper. Mr. Calton has consented to take pot-luck with us."

"If you will put up with the want of ceremony, Mr. Calton, we shall be pleased to have you stay," said Mrs. Lewis.

Mr. Calton bowed, and said he didn't like ceremony, and was excessively fond of country diet. Laura darted a glance from her gray eyes, which he observed, and which caused him to say to himself, "By Jove!"

"Yes, Sir," said Mr. Lewis, "that is just what we have, and nothing else—plain, wholesome, country food; nothing new-fangled or Frenchified in our dishes."

"Curds and cream," added Laura, "golden honey, new-laid eggs, and the crispiest of fresh rolls."

Mr. Calton looked at her again, and this time said, internally, "Thunder and Mars."

Mrs. Lewis frowned at Laura. If there was any thing celebrated in the region it was her table, which always groaned with the first quality of the flesh-pots of Egypt. People rarely refused an invitation to dine or sup with the Lewises. And what should possess Laura to talk so—contrary creature!

"I am sorry it is between whiles with our fruit, Mr. Calton," said Mr. Lewis, also fearing that Laura was on the verge of "capers," and anxious to divert attention from her. "Our Hoveys are off, and our Lawtons haven't come on. Wouldn't you like to take a turn in the garden, Sir? Our pears promise well."

"Certainly," replied Mr. Calton; "I can not have too much of out-of-doors life in this delightful country. Miss Lewis, why have I never heard of your scenery? It is by no means common to find so fresh a landscape in the neighborhood of the sea."

"Coming for nails," Laura answered, "perhaps you thought to see ore and slag only. To my accustomed eyes this is but a dull spot."

"You like city life best, possibly?"

"Innately, yes. I have never spent any time in the city."

His look of surprise flattered her; and as he followed her father into the garden, she felt a new impulse. The atmosphere changed—how pleasant the afternoon had become! She felt grateful for living in a handsome house.

"He seems to be a genteel man," commented Mrs. Lewis; "but he is no chicken."

"Chicken," murmured Laura, absently; "are you going to have chicken for supper?"

"Now, Laura, be spry. Open the parlor, and take Mr. Calton in. The table must be set now. I'll bet that Mary Brown is abed and asleep, lazy trollop! but they are all alike. Help is help. The supper will be all right, daughter, though we don't have chickens in July."

Laura rushed into the parlor, threw up the windows, and examined the premises anxiously. She opened the piano and surged up and down the keys. The voice of the summer sea mingled with the music; it had a glad sound, and she wondered that it came so near. It was provoking that there were no fresh flowers in the vases; but to-morrow it should be different; the room should be decorated, and set in order early! It was a delightful task, when any body was there. The whole house woke up—the kitchen was a scene of bustling preparation.

"The palace bang'd and buzzed and clackt,
And all the long-pent stream of life
Dash'd downward in a cataract."

Mrs. Lewis and her help ran to and fro so constantly that the effect of a stage procession was

produced, now in the keeping-room where supper was laid, now in the kitchen and buttery.

When Mr. Lewis returned with Mr. Calton quiet and order reigned. Mrs. Lewis was already in her high chair before the tea and coffee. Laura stood at her place with an air of indifference, but inwardly tormented with the fear that Mr. Calton might consider the whole affair "green" and countrified. Her fear was needless. Mr. Calton felt himself well entertained. Things might be verdant, but only in the sense of freshness. He thought Laura attractive, piquant, new. He was pretty well aware of the station and property of Mr. Lewis. Mrs. Lewis was by no means a tiresome woman, neither ugly nor vulgar. Nail buying had brought his lines into pleasant places. All this he pondered, while eating his excellent supper with a relish which Laura hardly approved of, but which delighted the housewife heart of Mrs. Lewis.

His first visit was a type of the second, and of all. Mr. Calton remained a week with the Lewis family; that is, he slept at the hotel, and passed his days in Laura's society. Mrs. Lewis served him with her best viands three times a day, and Mr. Lewis smoked a cigar and held short conversations with him at the same time and immediately afterward, but it was tacitly understood that the old people were not to interfere at any other time. The young pair walked on the shore in the moonlight evenings, and Laura tried to respond to Mr. Calton's apostrophic condition. He was truly moved by this novel contact with Nature; she blended with his sudden passion for Laura, and the illusion was perfect. Laura's thoughts were more wandering. She could not avoid seeing the opportunity that approached her. The monotonous life which surrounded her might be changed for a city life, for the theatre, the opera, and those inevitable engagements she supposed one must have in entering society as a married woman. Still she was maidenly chaotic—in a flutter, and a little proud. Mr. Calton was a superior man—easy, jovial, and self-sufficient, different from the country beaux, so anxious, and so tenderly beseeching when seeking her favor; and alas! different from the young coast surveyor, the lieutenant, who swooped down on the bay last year like a fish-hawk, and vanished like the same, with the help of a revenue cutter, and who was as delightful a hero as Conrad ever was—the corsair of hearts! The thought of *him* was put aside with firmness and a sigh.

The end of the shortest week either had known arrived. It was Sunday morning, and Mr. Calton accompanied the family to church, arrayed in snow-white costume, which came by express the night before in cool haste from his tailor. The black suits of the congregation "sang small" beside this fellow in full sail in Laura Lewis's tow! The impression he made was an irritable one. Common people are apt to feel scorn for that which is new to them; and scorn here was expressed by delicate sniffs,

snuffs, and smiles. Laura discerned it, and looked at him, even during the sermon, to exchange kind glances. As soon as service was over he offered her his arm in the very aisle, and she took it, blushing celestial rosy red. Papa and Mamma Lewis also exchanged meaning glances when this act took place, proud and important and parental, like a pair of old ducks.

"I must go home to-morrow," said Mr. Calton, as he and Laura turned into a side street.

"You must be tired of us by this time, I suppose."

"Of course I am."

"We shall never see you again."

"If you say so."

There was a dead silence between Mr. Allen's orchard and Captain Jones's sail-loft; then Mr. Calton skipped a pebble with his boot, and said:

"Do you say so?"

"I am sure we should be very happy to see you."

"Could you lower that parasol a trifle? I can not see your face at all."

Laura muttered something about the sun's dazzling her eyes, but nevertheless shut the parasol.

"We are near home," continued Mr. Calton, "but there is time enough for you to answer me one question. My dear, what do you think of me?"

Again Laura muttered something—that she esteemed him highly as a friend—had enjoyed his visit—hoped they might continue friends, and—mum, mum, mum.

"Hereafter the best of friends, Laura; but I mean differently now, or mean more. I am unwilling to return to New York without the hope of making you my wife. I know I am a dozen years older—what do you say? I can give you a pleasant home, and my whole heart."

"Not just now, please," urged Laura. "I should like to get home."

"Five steps more, and we are at your door. Yes or no, my dear Laura. My proposal can not appear so strange."

"No—yes."

He understood her, and shook hands heartily, whereat she laughed, and then he laughed. When they reached the room, where Mrs. Lewis was untying her bonnet, and Mr. Lewis dusting his hat, Mr. Calton, with timid formality, kissed Laura, "asked consent," and it was as if the programme of a hundred years was settled. Within two months the wedding came off, and Laura left home for the new one, in which this November day finds her, alone and unoccupied.

Mr. and Mrs. Calton were a model couple. The prayer of Agur was answered in their love—neither poverty nor riches were in it, but that medium which keeps domestic life in its true orbit. After buying a good deal of jewelry, and going to many places of amusement, Mr.

Calton went back to his business with fresh zest, and Laura took up life on a new external plan, which did not admit a bothersome analysis. In the third year of marriage they lost their first-born and only child. For a season Laura dropped, soul and body, into a dark abyss; the sun in heaven was put out, the moon did not shine, men were as trees walking, and she was alone in the world. That period passed, the accustomed life was resumed—a veil between it and the past, a shade upon Laura's beauty, an older look in Mr. Calton's face, and a different, deeper affection between them; but *that*, according to the wont of our undeveloped life, was not brought out and commented upon. By what theory is our wonderful world created? Men and women live together, fulfilling the apparent conditions of existence, and so many facets of their nature are never cut! One man dies at thirty, whose character is only revealed in its tender simplicity by the shadow of death. Another in the hour of danger brilliantly flashes forth his soul, as from a dark lantern, and then turns the closed sides to the world forever. And there are those who, in some unimportant moment, behold each other's souls in the prison of their eyes, feel them in the link between hand and hand, in the kiss, or word of flame from the lips. Sparkles all, darting and vanishing over the wide, misty plain of the commonplace!

At the end of five years Mr. Calton died suddenly—a prosperous man in the prime of life, full of schemes gratifying to Laura's worldly ambition. The "top of the ladder" he promised she should be—the leader of her set. The rings on her fingers and bells on her toes might be conspicuous wherever she went if she chose. Laura agreed with him, and with him drifted more and more into that outer world where the fruit grows which must, sooner or later, become ashes to the taste. All this was at an end now. At first Laura was stunned, then surprised that *her* life could be so changed. At last she fell into a dreary melancholy, which she believed was to last till some fatal disease should seize her and carry her off. Mr. Calton's will was a trifle humdrum in her estimation; the house was settled upon her, and an income enough to keep it up in the old fashion, no more. A relative or two was mentioned in the will; a cousin Martha was one—a widow, whom Laura had never heard of. This Martha was to have fifteen hundred a year paid to her at her home in the West, or at his own house in Darcy Street, provided she would consent to live with his wife, share her solitude, and be her faithful companion. Laura ordered the money to be sent to Ohio, where the cousin lived, refused to hear her letters read which she wrote to Mr. Calton's executors, and would not answer the several letters which Cousin Martha wrote to herself. So a full year passed. Nothing in the present moved her, nothing in the future interested. She told her acquaintances that the world seemed to have been made for the wind

to blow in, and who could tell where the wind came from? And she was not going to be left out in the cold. Seriously, she was wretched, as any woman aged twenty-eight may well be with the ordinary experiences of life. Her liberty was restricted because she was a woman, because of Mr. Calton's wishes, and because her fortune was small. The great panacea of change was denied her. It was the groove business with her as with most, but without heart to roll along in it. She felt no impulsion toward literature and art, was not "called" to be strong-minded, and had no especial faith to sustain her in this world, and take her to the next.

"When all that I *have* loved, that which has kept me vital, has passed into a blind and obdurate silence, how can I learn your faith?" she said to the Rev. Mr. Crucible. And Mr. Crucible wisely answered, "We must wait."

Still Laura's soul must have been groping for light; there must have been a latent sentiment for the spiritual, a yearning for that invisible but universal hope, or she would not have been knocking at the door of Catholicism, or at that still more obscure portal, Mysticism, or whatever name it goes by.

Her servant, Ann, opened the parlor door and her mouth at the same time, but said nothing, having no opportunity, she was followed so closely by a tall woman who sat down in the chair nearest the door, and began, in a clear voice:

"Me and my son agreed to look you up. Your silence, Cousin Calton, amused him and troubled me. Curiosity on his side, gratitude on mine. I am Martha Knox; John Calton's mother and my mother were sisters. I am just in from Ohio, and have been traveling three days steady. Now, am I to have your good word or not?"

Mrs. Knox set down her carpet-bag with energy, and folded her hands; but, notwithstanding her volubility, she was confused, Laura stared so at her with mute amazement.

"Me and my son," she repeated, as if to stay herself with a watch-word.

Laura was seized with a sudden acute perception that she had been very comfortable till now, and suffered a pang of remorse for not properly estimating the goods the gods had bestowed upon her. And here was Nemesis in the shape of "Me and my son."

She started up and rang the bell for luncheon.

"You must be fatigued, Mrs. Knox. Please come to the fire."

"I *am* fatigued; but am I to be Cousin Martha to you, or must me and my son give it up?" Mrs. Knox grasped her carpet-bag again.

"Is your son in that?" asked Laura, smiling in spite of herself, and Mrs. Knox smiled with her.

"I verily believe I shall have to like you," she said; "and me and my son's sense of duty will wear away."

The old lady came toward Laura with out-

stretched hand, which was taken kindly; and then Laura carried her into the dining-room, and fed her.

"How did you know that I lived alone, Mrs.—Cousin Martha?" asked Laura.

"Mr. Eben Bangs wrote us in the beginning so. Afterward he suggested that we should invite you to Ohio. Later, he sent us word that he thought it unwise for you to remain in the scene of your troubles. Me and my son thought differently, and here I am. But, my dear, I have to learn thereby that a remnant of pride still hangs round my old self."

Cousin Martha did not tell all that the executor had written. *He* called Mrs. Calton "weak, obstinate, and mistaken." As it was, Laura's eyes flashed.

"Mr. Bangs is a goose," she cried; "he exceeds his limits. And what has your son to do with any opinion concerning me? If you feel any necessity of expressing to *me* the obligation you feel toward Mr. Calton, pray do so; but we need not drag your son into the obligation."

"My dear, I *must*. I always yield to him. He is a genius, an artist, is my son Lester Knox."

"Old Woman of the Sea," murmured Laura. "I don't wonder he sent you off, this genius." Curiosity prevailing at last, she asked Cousin Martha what her son had done.

"Oh dear, what a thing fame is! Lester is the young artist who did the statue of Whinny Ha-ha, which stands behind the Speaker's chair in the hall of Congress. Lester is twenty-seven, you are twenty-eight."

Laura colored, and said that she had been in Washington.

"The statue looks like you."

"Mercy! Indeed?"

"You see, Mr. Bangs sent us your photograph. Lester thought your brow was regal."

Laura colored again, and felt rather lively; but was still angry.

"How very curious and fussy in Mr. Bangs to send my picture!"

"Not very, considering that Lester asked him for it, from mere curiosity, for he said—"

Cousin Martha broke her speech abruptly. It was evident to Laura that Lester had something against her. Cousin Martha began presently again:

"My dear, did you think I could receive John's bequest without learning all about him and his? A whole year has passed, and more. Knox nature could not stand it any longer. Me and my son are different. I had to come. He won't come himself; he will never see you; but we agreed about my coming."

Provoking Cousin Martha! Laura was thankful when bedtime came. Bedroom solitude loomed up as a desirable thing, though she had forgotten her annoyance more than once in preparing for Cousin Martha's comfort. She was also ashamed of certain little twinges and pulsations of affection for this downright visitor. She was alone, that was a fact; and womanly

sympathy was not so bad, even in Cousin Martha. She fell asleep and dreamed of "my son," as a disagreeable, yellow-haired Hoosier, in slipshod shoes.

"Dear me!" thought Cousin Martha, feeling very sleepless. "I have put my foot in it. I am paying a price for poor John's legacy. There is something I like in the girl too. I believe that John spoiled her. Aunt Liza, his mother, was a weak sister, if she was my aunt. Linen sheets in winter! She don't take the least notice of what her Ann does; there was twice too much bread cut. I hate the Irish. Laura is as handsome and peculiar as Lester said she was. There's a clock striking midnight, and there's tramping in the street yet. Oh dear! I have not taken my Bible out of my trunk. I forgot it. I hope I am excused."

Cousin Martha had reason to forget her old ways, for she was out of place. Laura frustrated all her attempts at usefulness. In vain she begged for work. It was better, she declared, to watch Lester make clay noses and clay drapery than to sit looking at nothing, or into the street, where every body dressed and walked alike. At last Laura took pity, and taught her some simple embroidery, which proved an advantage to both. Cousin Martha was docile, Laura was patient. "Though they pricked their fingers every stitch," they left in every bud a better appreciation of each other. Still one was homesick, the other bored. Cousin Martha grew reticent. She saw that Laura was not heart-broken, and needed no sympathy, and she felt that there was some lack in Laura's nature which her ignorance could not define. It might be profound, it might be repressed, undeveloped, or shallow. She thought it of no avail to remain with the independent, self-sufficient young widow, and decided to go home as soon as the claims of what she considered propriety were settled. It was a long and expensive journey; respect was due to John's memory; her friends and neighbors were aware of her visit to John's widow; pride would not permit a sudden return to them. Besides, she must wait for Lester's orders. She ceased to mention him, and Laura was no longer annoyed by reference to "my son." One day, when a letter came, Laura pleasantly asked her what was the news.

"He is making designs for a monument for General Marley, to be erected by his brigade. He mentions some French pictures on exhibition here—geener pictures he calls them—and tells me to observe the story-telling power painters have. Lester loves to teach his mother. Goodness knows I am ignorant enough."

"Well," said Laura, "shall we go to the picture-gallery?"

"If you please. I shall go back to him soon; he leaves the time to me."

Her face brightened so at the prospect that Laura felt a pang.

"You have had a melancholy visit, I am afraid. We must first go sight-seeing, and then

I will allow you to go home. Why will not Mr. Knox come for you?"

"Oh," replied Cousin Martha, with haste, "he says it is quite enough for me to have bored you; besides, he never thought of coming. He surmised that possibly you would like me well enough to make me a visit; we live in a pretty place; but you'll never think of doing so."

The eyes filled with tears, and her lips trembled in spite of her great self-control; and Laura felt so sorry and so ashamed that she kissed her vehemently.

"Dear Cousin Martha, you are worth two of me, and your son would find me a nuisance. What do I know of the artist life! I always thought artists were queer, and utterly irresponsible, vapid and fantastic outside of their art, slipshod in morals as well as in their shoes—not the sort of men to be related to, but exactly the sort to be invited to dinners and suppers, for the roaring element. I have myself met a painting lion or two with a good deal of mane."

"You *should* visit me and my son," replied Cousin Martha, with dignity.

That very day they went to the picture-gallery. On the way Laura asked if statues brought much money to artists in ordinary; of course she had heard the prices which the sculptors received who lived abroad.

"Lester will have eight thousand dollars for the monument; that includes the base with bass-relief designs."

"You are quite rich, then."

"All generals do not have monuments. Orders are few and far apart. We have been extremely poor. Lester has cut cameos, headstones, signs in wood even, Turks and Indians. Poor, grand boy! His father died when he was only five. I have made shirts, dresses, baby-clothes, every thing to keep the wolf from the door; and we did. Nobody starves in the West. Corn-dodgers and pork are free to every body that's honest and industrious."

"Hush," said Laura, for Cousin Martha's voice grew loud over her bitter recollections. "Here we are at Goupil's; we must go up stairs."

There must have been some latent artistic power in Cousin Martha, she so suddenly forgot every thing in her delight; first at the harmonious aspect of the salon, and then over the pictures. It must be confessed that here she rose superior to Laura, and Laura humbly felt it. She followed silently in her wake.

"See!" said Cousin Martha, pointing to a Bougereau—a mother and child—"the ineffable glory of maternity in this beautiful, simple woman's face, as she watches her sleeping babe, as yet only a degree beyond a new-born kitten."

"Yes," answered Laura, softly.

"And here"—stopping before the "Autumn" of Hamon—"do you perceive the silent buoyancy of the floating figure extinguishing the last flowers in the pale, dusky atmosphere?"

Dear me, Lester ought not to be living in Lanerk, when such pictures come over the water."

"It is beautiful; but what an impossible idea!"

"Lester says nothing is impossible to the spirit of Art. But here is a different picture; what do you think of it?"

"A Spanish coatee—what handsome muleteers! One must go to Spain for such men."

"Or to Lanerk, Ohio," said Cousin Martha to herself.

Laura was pupil throughout the visit, and she came home with a sense of relief at the non-appearance of "my son." If the mother gained so much in the atmosphere of art, what would he prove to be? and herself so lamentably ignorant, so behind the times, as she perceived she was. What a musty old street Darcy Street looked! what a dingy old house hers! what an empty, foolish, frivolous circle she moved in!

Cousin Martha did not appear the next morning at the breakfast-table. Laura waited, and then went up to her bedroom to find her in bed, feverish, and with headache. By noon, she said, she should be well; Lester's letter, or the pictures, or a cold, had made her a little poorly; a cup of tea would set her right! It was not so. At night she was so ill that Laura sent for a doctor, who declared the illness to be a rheumatic fever, which was always painful, sometimes tedious, occasionally dangerous. Cousin Martha contradicted him with asperity; *she* knew her constitution, he didn't. Besides, she must go home; Lester was expecting her, and she would not disappoint her dear boy for all the rheumatic fevers in creation. The dear boy was not talisman enough to protect her from the fever; it increased, and in her sufferings she became dovelike in patience and gentleness. Laura watched her night and day; the long-stifed traits of compassion, benevolence, and self-abandonment came into full play. Tenderness gave birth to tenderness, and, except in the case of her child, Laura was never so absorbed. She received a shock, however, when the doctor said that Mrs. Knox's family must be told of her illness, and perhaps sent for. A struggle took place in her mind, and then she went to Cousin Martha's bedside.

"Dear cousin, it would be a comfort for you to see your son; shall I send for him?"

Such an appealing expression came over the worn face, that Laura had difficulty to hide her tears.

"It would be good of you to ask him to come; but it would make so much trouble to have a strange man in the house. I am not so very sick, am I?"

"I want him to come, to cure you."

Cousin Martha folded her hands over the coverlet with such content that Laura hurried down, either to telegraph or write a letter to her son. She took her little, unused desk in her lap, and began to write:

"Sir." That was stiff.

"My dear Mr. Knox." That was conventional.

"Cousin Lester." He was not her cousin.

The doctor came in.

"Better telegraph," he said. "Time flies; it is a long distance between here and Ohio. Puss, you have done pretty well lately; I'll give you a diploma."

"Common decency," said Laura.

"Fiddle-stick! The old woman comes of a stock, and you like her; she has done you a good deal of good. I know your appetite is better since she came."

"It isn't a mite better," Laura replied, indignantly. The doctor laughed and went up stairs, and Laura dispatched the message. When Lester Knox received it, such was his consternation that he snatched up his hat and coat, hurried to the station, and jumped into the train just starting. He tried to shut out all thought. It was not possible to admit that his mother, the only woman friend and relative he had, was in danger. What a fool he had been to let her travel so far from him! He confounded Calton's bequest. Why should they cotton to his widow for that? To be sure, it had opened a vista to Italy; and that more confounded photograph of hers, which that old dunce Bangs had sent, had opened a foolish dream vista; he wished them all further—at the North Pole!

In this condition he arrived at Darcy Street early in the evening. He rung the door-bell furiously. Ann, who was in the hall lighting the gas, opened the door, and he rushed in. Laura at that instant was coming down stairs with a glass in her hand. He sprang toward her.

"How is she, Laura?" and he seized her hands. The glass fell and shattered as he drew her close to him and looked anxiously into her face.

"She is no worse, Lester, to-night," she soothingly replied. "I am so glad you have come. This way, please."

She led him into the parlor to a seat, and took off his hat. He was on the point of breaking down; that, with a man, means crying like a woman. She stood before him in silence. Raising his head presently, he looked at her searchingly and said:

"I know that you have been most faithful in caring for her; thanks, Mrs. Calton."

"I have done my best; you are welcome, Mr. Knox."

He suddenly felt conscious of being shabby, and gave an embarrassed laugh.

"Where shall I go, Madam? I am tired, dirty, and hungry. Where's the tailor, the butcher, and the candlestick maker?"

"Stay with your mother, of course. I must first tell her that you are here. She is feeble and nervous. It will not do for you to rush at her as you did at me, Sir. Your room is ready."

His eyes blazed like diamonds. The dust of

travel was not over them at all events. He was relieved, but still feared to ask questions concerning his mother.

"Cousin Martha has been better for twelve hours," added Laura. "Ann will take you to your room." Laura paused a moment to think of him. First, he was undeniably dirty; but then he was as undeniably handsome. He had no sentimental nor long-haired aspect; on the contrary, an uncommonly fierce and cropped one. His hair was short, his beard long, both reddish in hue; his nose was large, so was he; tall and broad-shouldered; and his eyes were awfully keen. She felt like having a fight with him, and made up her mind to avail herself of the first opportunity. Very softly she crept back to Cousin Martha's bedside, to break the exciting news of his arrival, and—found him there. Cousin Martha had both arms round his neck, and he was kneeling beside her.

"Of course I asked Ann to bring me here. Ann is a good girl; has she waited much upon you, mother? I'll make her bust," he said, in a low voice.

"Only Laura has taken care of me, Lester dear. I have been a world of trouble to her. Oh, I have ached so!"

"It is nearly over now, old lady. Let me go. I'd like a little water to cleanse me of this business."

She whispered that there were some new-fashioned shirts and gay cravats for him in her trunk. Would he have them now?

"Indeed I will; for it is alone my inky cloak, good mother. I came off without a rag of luggage."

He tossed over the contents of the trunk till Cousin Martha begged Laura to assist him; he never could find any thing. It was a picture to the old lady to see the two heads close together over the trunk, and both their hands in it. At a suppressed giggle from Laura, she closed her eyes in pure thankfulness and remained silent. They left the room on tip-toe.

In the course of a few days Cousin Martha discovered that Ann was her nurse instead of Laura; but she was mending, and could easily keep the discovery to herself. Ann was also significantly silent.

No visitors came to the house now, it being generally understood that Laura's visitor was severely ill, and the opportunity for acquaintance was excellent. Laura and Lester were firm in their resolution not to like each other, or allow any influence between them; but each gave way to the singular curiosity of probing the nature of the other. They told lies constantly, and were as constantly detected. It was a sort of guerrilla warfare—unexpected attacks were made on both sides, although they were as watchful as cats in combat. Then they were terribly moody. If one was melancholy, the other was gay; if Laura was conventional, Lester professed reckless Bohemianism; if she talked what he called cant and caste, he mounted his Ideal horse, and talked her out of

sight. Every moment they loved more and more, and grew afraid and timid about winning each other. At last he determined to subdue her or die, and his ferocious determination led him to act as follows:

The dinner was served as usual one day. Ann was with Cousin Martha, and there was no regular waiting. The cook came up when the bell was struck. Lester sat opposite Laura. Placing his elbows on the table, he said:

"You know that I am madly in love with you. By my soul I must come over and sit beside you! Will you kiss me if I come? Then I'll eat my dinner; otherwise I will not. I can not, dare not, stay in your presence another day."

Laura made a cool feint of pressing the bell.

"Ring the bell, if you dare," he said. Their eyes met; a steady light glowed in his, a flickering, willful one in hers.

"Mercy!" she said. "Where am I?"

"In your own house; which I wish to take you out of. Come into my house, Laura; be my wife, and live a new life with me—an artist. Let me teach you happiness. Have you ever known any, my poor girl?"

Laura thought of her dead boy.

"Lester," she cried, passionately, "do you remember that I *have* been a wife and mother?"

"A mother—yes. But you are an ignorant creature still. Laura, decide."

He rose to his feet, and her glance followed his uprising. Should she give way? How he trembled at heart! Was he to lose this woman, who had so knit herself in her beauty and sweetness to his every fibre? But he stood in a quiet attitude, and there was no agitation in his face. Her whole life rolled before her like a panorama. Most of it was a crude waste. All the ordinary experiences of womanhood bringing her to this result! Was the right way before her at last?

"Laura!"

She held out her arms, and he came to her.

"Tell me something," he begged, kissing her passionately.

"Take care of me—save me. I have seen nothing. I am so unhappy!"

"More than this, my love, you must give me. I have been harsh with you."

"I love you, Lester, just as you have loved me, from the instant you dashed the glass from my hand."

A moment of that wonderful, virgin silence passed, and then Lester cried that the soup was cold.

"Go to your place," Laura ordered. There was little dinner eaten that day. Lester left his place continually; and at last they went up stairs to Cousin Martha. Before they could utter a word she said:

"Laura, did I not tell you that me and my son were agreed? Oh, I am so happy! I am so glad I had the fever. Dear children, you belong to each other. But you are queer, and you must make allowances."

ABOUT WALKING-STICKS AND FANS.

THE staff for old age is immemorial. "What animal," asked the Sphinx, "walks upon four legs in the morning, two at noon, and three in the evening?" *Œdipus* solved the enigma: "Man creeps in the morning of life, walks erect at noon, and supports his infirmities upon a staff in the evening of his days."

Homer sings of the sceptre-staff of Achilles. "I will swear," says the hero, "by this staff, which shall never again bear shoots, since the axe has stripped it of leaves and bark." Judah pledged his staff to Tamar that he would send her a kid from the flock. The Assyrian general Rabshakeh taunted the adherents of Hezekiah with leaning upon the staff of Egypt, "upon which, if one rest, it will pierce his hand." And even the patriarch Jacob pleads God's mercies as following him from the time he passed across Jordan, staff in hand. In Egyptian hieroglyphics the king is known by his walking-stick; in Assyrian sculptures, used indifferently as cane or sceptre, now the plaything of the royal children, and then the token of sovereignty to the rightful heir, the flower-headed staff indicates exalted rank; and in the cave paintings of the upper Nile the successful warrior, leading the procession of prisoners, is supported by the reed, carved with the lotus flower and adorned with jewels.

English portraits of the sixteenth century have gained the name of "Cane-staff pictures." Henry VII. gave forty shillings for a walking-stick guilte with silver, with *astronomie* upon it; and his successor, for "a cane garnished with golde, perfume in the top, a foot-rule, a knife, and a file of golde concealed therein," gave, according to "Fairholt's Costumes," forty-eight shillings. In the middle of the seventeenth century walking-sticks began to increase in luxury. They indicated rank. The learned professions adopted them. Ladies of quality used them in out-of-door promenades. Beadles received them from clergymen at church entrances. The lord chancellor stood his cane behind the wool-sack. They became insignia from which leading surgeons and physicians did not part for more than a hundred years. Made of marble and agate, slender in proportions, richly mounted with precious stones, tinted with a rare semi-opaque, bent at top, tipped with ivory, and when not in use kept in shagreen, they were, even as seen now among curious relics in the Tower of London, far surpassing in luxury and taste, ingenious contrivance and expensive ornament, any thing of the kind in modern days. Readers of Pope's "Rape of the Lock" will recognize

"Sir Plume, of amber snuff-box justly vain,
And the nice conduct of a clouded cane."

In No. 103 of the *Tatler*, published December 6, 1709, and in the *London Chronicle* of September 7, 1762, the lover of English clas-

sics will find curious accounts of walking-sticks in the eighteenth century.

The *alpenstock* has a history of its own. It is now, as used by Alpine travelers, a stout pole, six feet long, with an iron spike at one end, and a chamois horn at the other. It comes from the pilgrim-staff of the Middle Ages. The *bourdon*, as the Knights Templars call it in their chronicles, was a strong stick, five feet in length, armed at the lower end with an iron spike, and intended to supply support and balance to the user when climbing steep acclivities. Ten inches from the top was a protuberance on which to rest the hand. The upper part unscrewed. In its hollow relics were concealed. From the crooked knob a bag or bottle could be suspended, the *bourdon* being on the shoulder. A hole pierced the head for the palm branch to be inserted, as proof of authentic pilgrimage.

There is no doubt, however, that the pilgrims' staffs frequently contained secular as well as sacred articles. It was the hollow of a *bourdon* which brought from Greece the first head of saffron, when the penalty was death for taking the living plant out of the country. It was a pilgrim's staff that contained the first tulip bulb introduced into Holland, the after-propagation of which became a source of large national income. The asparagus traces its origin in England to the contents of a Templar's hollow cane; the silk-worm found its way across the seas in the same concealed receptacle; and the seeds of the melon and apricot, tomato and onion, cauliflower and quince, indigenous to Oriental tropics, were transported as exotics to the less kindly soil of Western Europe in the cavities of pilgrims' staffs. Cervantes tells of certain Spanish palmers who concealed gold in their hollow wands, bringing it from Saracen infidels to enrich abbeys and monasteries; and Richard Cœur de Lion was enabled to provide for the wants of his train during his imprisonment in Germany from coin kept secret in the same way.

The ancient contrivance is not obsolete. Turning from the dead past to the living present, it is found that walking-sticks are still made with hollow centres to answer as repositories. Mustapha Ibrahim, the principal medical man of the Sultan's harem, descends from his carriage, and, accompanied by eunuchs, enters the guarded inclosure, supported by a long gold-mounted cane, which contains medicines and surgical instruments. The English Geographical Society provides its Central African explorers with supplies of spring-spear canes and sword-sticks. Alpine travelers now measure altitudes with sextants carried within their *alpenstocks*; and theodolites in walking-sticks are one of the present necessary accompaniments of the scientific traveler in Northern Asia.

Since 1851 commerce in ordinary walking-sticks has more than quadrupled. In Hamburg, Berlin, and Vienna—the present central dépôts for export—the manufacture employs

many thousands of work-people. Its control is in the hands of the Jews. The Meyers, members of one family of German-Hebrews, are at its head in Austria and Germany proper, and by management peculiar to their race have absorbed all competition. First gaining ascendancy at home by the style and cheapness of their wares, they next assailed foreign markets. In Bombay they undersold the Chinese dealers. Scattering thin light bamboo rods along the overland route to India, the native productions in Egypt and Arabia gave place to the more convenient Viennese manufacture. The French occupation of Algiers introduced their graceful walking-sticks to the Moorish gentry of Northern Africa. Paris began to adopt them. Madrid, Naples, and even London followed. They drove the English canes out of the Brazils, and on the western coast of South America, where Belgian manufactures had enjoyed immemorial monopoly, they found a demand which it taxed all their resources to supply. Curiously enough, California, in the use of the Viennese walking-cane, preceded the Eastern States. Mine-explorers and gold-diggers of the Sierra Nevada country gave *ton* to fashion in New York and Chicago. The importation of the Meyers' canes at the present time into the United States has swallowed up, like Aaron's serpent, all other. They are found every where. No Jew clothes-man fails to keep them among his stock of goods. Light French ratans, heavy English crab-sticks, curiously carved Brussels thorns, and even the choice Alcasian orange-sticks, have disappeared. The Jew specialty always succeeds, and the walking-stick, manufactured now for thirty years by the Meyers millionaires, furnishes no exception.

In the present manufacture of canes great quantities and varieties of materials are consumed. There is scarcely grass or shrub, reed or tree, that has not been employed at one time or another. The black-thorn and crab, cherry-tree and furze-bush, sapling oak and Spanish reed (*Arundo donax*), are the favorites. Then come supple-jacks and pimentoes from the West Indies, ratans and palms from Java, white and black bamboos from Singapore, and stems of the bambusa—the gigantic grass of the tropics—from Borneo. All these must be cut at certain seasons, freed from various appendages, searched to discover defects, assorted into sizes, and thoroughly rid of moisture. A year's seasoning is required for some woods, two for others. Then comes the curious process of manufacture. Twenty different handlings hardly finish the cheapest cane. The bark is to be removed after boiling the stick in water, or to be polished after roasting it in ashes; excrescences are to be manipulated into points of beauty; handles straightened and shanks shaped; forms twisted and heads rasped; tops carved or mounted, surfaces charred and scraped, shanks smoothed and varnished, and bottoms shaped and feruled. Woods, too, have to be studied, lest chemical applications that beautify one might

ruin another kind. Some are improved under subjection to intense heat, others destroyed. Malacca canes have frequently to be colored in parts so that stained and natural surfaces are not distinguishable; heads and hoofs for handles are baked to retain their forms; tortoise-shell raspings are conglomerated by pressure into ornamental shapes, and lithographic transfers, done by hand, are extensively used upon walking-sticks for the Parisian market.

Staffs with grotesque heads hold their own in every age. Why, it is difficult to say. Old cynics of Greek memories used them. They were the badge of the tribunes in Rome, whom the better classes despised. Fools and jesters of the Middle Ages carried them as baubles distinctive of their class. The *Universal Spectator* points them out, in 1730, as "the large oak sticks, with great heads and ugly faces carved thereon, carried at the court end of town by polite young gentlemen instead of swords." That daft Highland laird, Robertson of Kincraigie, made himself famous by carving effigies of friends and caricatures of enemies on the upper end of walking-sticks, until the accost, "Wha hae ye up the day, laird?" became a cant phrase for lunacy all over Scotland. The brigands of Italy adopt them. They are favorites with Magyar chiefs in Hungary; and those used by members of Kossuth's train, during his visit to the United States in 1851-52, were objects of particular notice. It would seem that they have been the accompaniments of eccentricity in every age of the world, but for what reason it is difficult to say. Facts, like *bon-mots*, are not always explicable. Talleyrand, standing in an ante-room through which the Duchesse De Grammont was passing to dinner, looked up and said, "Ah!" In the course of the feast the lady asked him, across the table, why he had uttered the exclamation "Oh!" upon her entrance. The witty statesman replied, "*Madame, je n'ai pas dit oh! j'ai dit ah!*"

Animal substances have given almost entire place to vegetable in materials used for walking-sticks. Whalebone is exhausted by the umbrella manufacturers; and tortoise-shell, ram's horn, rhinoceros hide, shark's spine, narwhal bone, and ivory—once used largely by cane-makers—have become too costly a raw material. The horns of animals, which, treated by heat and mechanical appliances, used once to be drawn out into rods, are no longer employed. The hide of the rhinoceros, elastic and tough, submitting readily to chemical agents, and forming a semi-transparent, horn-like substance, is abandoned on account of enhanced cost. Ivory and bone, also, have become too valuable for other manufactures to compete with vegetable products as materials for walking-sticks.

When Goodyear, five-and-twenty years ago, introduced his hard, vulcanized India rubber to the arts, for cutlery handles, harness trimmings, furniture, and boudoir ornaments, it was expected to supersede all other materials in the manufacture of walking-sticks. It vies with

ebony in color. No known substance is capable of higher polish. Neither heat nor frost affects it. Closeness of texture, freedom from brittleness, lightness of weight, and imperviousness to abrasion, give it extraordinary advantages. For several years it became the *haut ton* of London, Paris, and Berlin. Even now, to elderly gentlemen of *mode*, who affect gold heads surmounting stout and serviceable staffs, it is *distingué* above all others. But its cost killed it. For general use it was never much introduced. Besides, it lacks elasticity—an essential element in walking-sticks—and hence is never likely to compete with the various woods.

The highly ornamented and decorated sticks used by the rajahs of the East, exhibited at the Paris Exposition, can hardly be considered as articles of commerce. Bamboo canes richly mounted in gold and silver, sandal-woods enriched with painted ornaments, ivory *chowrees* elaborately carved, *chowrees* made of the tail of the yak (*Bos grunniens*), beetle-nut wands with silver handles, supple-jacks from St. Vincent, and whale's-tooth sticks from Trinidad, are merely objects of curiosity. The same may be said of the sticks used for staffs carried before African chiefs, of the stained quina walking-sticks made at Groenkloof, of the too-roo-palm-rind canes, and of the staff of solid gold, set with carbuncles and diamonds, exhibited by the Rajah of Kishnagur. None of these, however, can be considered as representing the art of stick-making in a commercial sense.

All that remains can be said in a word. Walking-sticks are in perpetual demand. While England supplies her home demand for the finished article, she exports raw material, both of native production and foreign growth, for more than a moiety of all the manufactures of the Continent. France to a great degree takes care of herself. Germany imports the raw materials only. The rest of the world, from Alexandria to Canton, and from New York around the Cape to Pacific ports of entry, depends for its walking-sticks upon those hives of industry, Hamburg, Berlin, and Vienna.

Turning to fans, we find that more than three thousand years ago artists in Egypt painted fans on the walls of the tombs at Thebes. The fan-bearer ranked other officials. His investiture was a grave ceremonial. Pharaohs of various dynasties sit surrounded by fan-bearers. The insignia of the office are unmistakable. Slender, vividly-colored fans, on twisted handles, cool the voluptuous monarch at his meals, and guard sacred offerings from noxious vermin. Its use in Greece was similar in purpose, but more graceful in appliance. Its form became more beautiful. The wings of a bird, joined laterally, formed the graceful fan of the priest of Isis when she became a Grecian deity. In Rome the fan was sacred to Bacchus. The *mystica vannus Iacchi* was borne in procession at Eleusinian mysteries. Female slaves waved the *flabellum* over priestesses. Tinted plumes of

the ostrich, semicircular at top and confined at base—the type of the state fan of China to-day—hung from the ceilings of gilded boudoirs; and at the games of the amphitheatre matrons hid their faces and courtesans coquetted behind gorgeous feathers of the *muscarium*, held up by striplings and damsels.

The folding-fan was brought to France by Catherine de Medicis. Formed of perfumed leather, shaped by sculptors, and painted by artists, it reached its ascendant in the luxurious reign of Louis XV. From the reigning favorite it received the name of “Pompadour.” Gilding and gems increased its favor. Watteau and Boucher lavished upon it their genius. Without it the toilet of a lady of rank was incomplete. Prices paid for the more choice and elaborate kinds were fabulous. Choiseul, to gain the favor of Madame Du Barri, presented her a fan the value of which was estimated at 30,000 francs; and the *blasé* king supposed he was winning the affection of the same woman—already purchased by a clique at court for the end she attained—by a similar gift, one diamond in the setting of which had been procured at Vienna at the cost of £1400.

England imported fans to a large amount from Italy in the last century. At the period of Addison and Steele a lady would have felt as awkward without her fan as a gentleman without his sword. Sir Roger de Coverley, in describing “the angry flutter, the modest flutter, the timorous flutter, the confused flutter, the merry flutter, and the amorous flutter of a fan,” says: “I have seen a fan so very angry that it would have been dangerous for the absent lover who provoked the passion to have come within the wind its motion produced.”

In the fan-manufacture of to-day China and France are the great rivals. They monopolize the supply of the world. In lacquered fans the former country has no equal—its most common productions being remarkable for originality, boldness, brilliancy of coloring, sharpness of drawing, and correctness of workmanship. The great centres of production are Canton and Soutchou, Hang-tchou and Nankin. Fans for each different market constitute independent manufactories. Richly-painted *punkahs* for Ceylon; peacock-feathers for Assam; fans affixed to central handles, gorgeously enriched with embroidery and jewels, for Indian rajahs; fans suspended from silver rods, and made to wave to and fro, for wealthy Brahmins; and fans manufactured of khus-khus grass (*Andropogon muricatus*), which emit fragrant perfumes, of sandal-wood, of bamboo, of the palmyra leaf, and of the divided leaf of the *Borassus flabelliformis*, for European and American markets.

Egypt, Spain, Turkey, and Tunis produce fans for home supply. Würtemberg manufactures fans for Eastern Germany. British Guiana exports ita-palm fans to its tropical neigh-

bors. The East Indian fan, that does not close—the Assam peacock-feather fan, with its staff fitted for the foot of the servant who waves it back and forth—the Delhi *punkah*, made of beads and pearls—and the hand-fans of Bengal, are made at home for home consumption only.

France, next to China, is the producing country of the world for this species of manufacture. Its labor is subdivided. Each fan, that sells at wholesale for a cent, passes in making through twenty hands. Fans for different countries are made in different work-shops. The length of ribs for Algeria will not answer for Madagascar. Fans for Mohammedan nations must be without representations of living objects; for Buenos Ayres, without either blue or green colors; for Bulgaria and the East, feathers alone are used; for the South American states, paper.

From the *pied*, or frame, which is composed of inner and outer ribs, and made from wood or mother-of-pearl, tortoise-shell or ivory, to the painted *feuille*, or leaf, composed of parchment or vellum, satin or gauze, the process of fan-manufacture has reached, in France, a high degree of perfection. The exclusive industry of Audeville, Boisière, and St. Geneviève is devoted to the *pieds*; of Méru, Beauvais, Oise, and Corbeil-Cerf to the *panaches* (or ribs); and of Deluge to the *feuilles*. More than 60,000 work-people live by the trade. Artists in Paris, known as *feuillistes*—decorators, who ornament the frames—overlookers, who attach the tassels—lithographers, who illustrate by chromos—polishers, piercers, sculptors, gilders, and spanglers, who each make specialties of their parts—find in the vast production of fans their means of livelihood.

The printing, coloring, mounting, and final embellishment of French fans are under the direction of the *eventailliste*—fan-maker, in fact, though he has little to do with any portion of its manufacture. He collects the work of the various fan-artisans, arranges their productions, and employing a small number of skilled workmen in shops usually adjoining his warehouse, mounts the *feuille*, ornaments the fan with feathers or lace, gewgaws or tinsel, and places upon it the last decorations. He also furnishes drawings to the operatives in the departments, invents new fashions, instructs the *feuilliste* as to constantly-differing styles of ornament, groups together the belongings, and assorts qualities and kinds for market.

The annual value of fans made in France exceeds 10,000,000 francs. Machinery is now largely employed. During the last twenty years, while the product has trebled, the employés have diminished. The fly-press has taken the place of hand labor, and chromo-lithography of the artist's brush. At the present rate of increase, especially of cheap fans, France threatens to drive China out of the markets of the world.

JANE AUSTEN.

JANE AUSTEN.

A FEW years ago, a gentleman visiting the beautiful cathedral of Winchester, England, desired to be shown the grave of Jane Austen. The verger, as he pointed it out, asked, "Pray, Sir, can you tell me whether there was any thing particular about that lady; so many people want to know where she was buried?" We fancy the ignorance of the honest verger is shared by most American readers of the present day, respecting the life and character of a lady whose novels commanded the admiration of Scott, of Mackintosh, of Macaulay, of Coleridge, of Southey, and others of equal eminence in the world of letters. Even during her lifetime she was known only through her novels. Unlike her gifted contemporary, Miss Mitford, she lived in entire seclusion from the literary world; neither by correspondence nor by personal intercourse was she known to any contemporary authors. It is probable that she never was in company with any person whose talents or whose celebrity equaled her

own; so that her powers never could have been sharpened by collision with superior intellects, nor her imagination aided by their casual suggestions. Even during the last two or three years of her life, when her works were rising in the estimation of the public, they did not enlarge the circle of her acquaintance. Few of her readers knew even her name, and none knew more of her than her name. It would scarcely be possible to mention any other author of note, whose personal obscurity was so complete. Fanny Burney, afterward Madame D'Arblay, was at an early age petted by Dr. Johnson, and introduced to the wits and scholars of the day at the tables of Mrs. Thrale and Sir Joshua Reynolds. Anna Seward, in her self-constituted shrine at Litchfield, would have been miserable, had she not trusted that the eyes of all lovers of poetry were devoutly fixed on her. Joanna Baillie and Maria Edgeworth were far from courting publicity; they loved the privacy of their own families, one with her

brother and sister in their Hampstead villa, the other in her more distant retreat in Ireland; but fame pursued them, and they were the favorite correspondents of Sir Walter Scott. The chief part of Charlotte Brontë's life was spent in a wild solitude compared with which Stevenson and Chawton might be considered to be in the gay world; and yet she attained to personal distinction which never fell to Miss Austen's lot. When she visited her kind publisher in London, literary men and women were invited purposely to meet her: Thackeray bestowed upon her the honor of his notice; and once in Willis's Rooms, she had to walk shy and trembling through an avenue of lords and ladies, drawn up for the purpose of gazing at the author of "Jane Eyre." Miss Mitford, too, lived quietly in "Our Village," devoting her time and talents to the benefit of a father scarcely worthy of her; but she did not live there unknown. Her tragedies gave her a name in London. She numbered Milman and Talfourd among her correspondents; and her works were a passport to the society of many who would not otherwise have sought her. Hundreds admired Miss Mitford on account of her writings for one who ever connected the idea of Miss Austen with the press.

It was not till toward the close of her life, when the last of the works that she saw published was in the press, that she received the only mark of distinction that was ever bestowed upon her; and that was remarkable for the high quarter whence it emanated rather than for any actual increase of fame that it conferred. It happened thus. In the autumn of 1815 she nursed her brother Henry through a dangerous fever and slow convalescence at his house in Hans Place. He was attended by one of the Prince Regent's physicians. All attempts to keep her name secret had at this time ceased, and though it had never appeared on a title-page, yet it was pretty well known; and the friendly physician was aware that his patient's nurse was the author of "Pride and Prejudice." Accordingly he informed her one day that the Prince was a great admirer of her novels; that he read them often, and kept a set in every one of his residences; that he himself therefore had thought it right to inform his Royal Highness that Miss Austen was staying in London, and that the Prince had desired Mr. Clarke, the librarian of Carlton House, to wait upon her. The next day Mr. Clarke made his appearance, and invited her to Carlton House, saying that he had the Prince's instructions to show her the library and other apartments, and to pay her every possible attention. The invitation was of course accepted, and during the visit to Carlton House Mr. Clarke declared himself commissioned to say that if Miss Austen had any other novel forthcoming she was at liberty to dedicate it to the Prince. Accordingly such a dedication was immediately prefixed to "Emma," which was at that time in the press.

Though singularly barren of events—so

smooth was the current of its course—the life of this gifted woman was well worthy of the affectionate biographer it has found in the person of her nephew, the Rev. J. E. Austen-Leigh, from whose interesting volume we borrow the material and much of the language of this article. After a long period of undeserved neglect her novels are again coming into vogue with readers of quiet and refined tastes; and many may take an interest in a delineation of her mind and character. Many may care to know whether the moral rectitude, the correct taste, and the warm affections with which she invested her ideal characters were really existing in the native source whence those ideas flowed, and were actually exhibited by her in the various relations of life. "I can indeed bear witness," writes her nephew, "that there was scarcely a charm in her most delightful characters that was not a true reflection of her own sweet temper and loving heart. I was young when we lost her; but the impressions made on the young are deep, and though in the course of fifty years I have forgotten much, I have not forgotten that 'Aunt Jane' was the delight of all her nephews and nieces. We did not think of her as being clever, still less as being famous; but we valued her as one always kind, sympathizing, and amusing."

Jane Austen was born on December 16, 1775, at the parsonage house of Steventon, in Hampshire, England. Her father, the Rev. George Austen, was of an old family. At the time of his daughter's birth he held the two adjoining rectories of Deane and Steventon. The two villages were little more than a mile apart, and their united populations scarcely amounted to three hundred, so that this was not considered a very gross case of plurality. At this time the grandfather of Mary Russell Mitford, Dr. Russell, was rector of the adjoining parish of Ashe; so that the parents of two popular female authors must have been intimately acquainted with each other.

Many changes have passed upon these parishes since Jane Austen was born, nearly a century ago. At the present time the pretty, shaded lane between Deane and Steventon is as hard and smooth as the best turnpike road; but it was then a mere cart track, so cut up by deep ruts as to be impassable for a light carriage. In those days it was not unusual to set men to work with shovel and pickaxe to fill up ruts and holes in roads seldom used by carriages, on such special occasions as a funeral or a wedding. Ignorance and coarseness of language also were still lingering, even upon higher levels of society than might have been expected to retain such mists. About this time a neighboring squire, a man of many acres, referred the following difficulty to Mr. Austen's decision: "You know all about these sort of things. Do tell us. Is Paris in France, or France in Paris? for my wife has been disputing with me about it." The same gentleman, narrating some conversation which he

had heard between the rector and his wife, represented the latter as beginning her reply to her husband with a round oath; and when his daughter called him to task, reminding him that Mrs. Austen never swore, he replied: "Now, Betty, why do you pull me up for nothing? you know very well that's only *my way of telling the story.*"

Mr. Austen was a remarkably good-looking man, both in his youth and his old age; and at seventy years he attracted observation by his fine features and abundance of snow-white hair. In Mrs. Austen also was to be found the germ of much of the ability which was concentrated in her daughter Jane, but of which others of her children had a share. She united strong common-sense with a lively imagination, and often expressed herself, both in writing and in conversation, with epigrammatic force and point. She lived, like many of her family, to an advanced age. During the last years of her life she endured continual pain, not only patiently, but with characteristic cheerfulness. She has been heard to say, "I almost think sometimes that God Almighty has forgotten me; but I dare say He will come for me in His own good time." She died and was buried at Chawton, January, 1827, aged eighty-eight.

Jane Austen had one sister—Cassandra—about three years her senior, to whom she was most tenderly attached. "If Cassandra were going to have her head cut off," said their mother, on one occasion, "Jane would insist on sharing her fate." This attachment was never interrupted or weakened. They lived in the same home, and shared the same bedroom, till separated by death. They were not exactly alike. Cassandra's was the colder and calmer disposition; she was always prudent and well judging, but with less outward demonstration of feeling and less sunniness of temper than Jane possessed. It was remarked in her family that "Cassandra had the *merit* of having her temper always under command, but that Jane had the *happiness* of a temper that never required to be commanded."

Of her five brothers, the two youngest, Charles and Francis, were sailors during the most active and glorious period of the British navy. Both were often engaged in important service, and both rose to the rank of Admiral. Francis lived to attain the very summit of his profession, having died in his ninety-third year, G.C.B. and Senior Admiral of the Fleet, in 1865. He possessed great firmness of character, with a strong sense of duty, whether due from himself to others, or from others to himself. He was consequently a strict disciplinarian; but, as he was a very religious man, it was remarked of him that he maintained this discipline without ever uttering an oath, or permitting one in his presence. On one occasion, when ashore in a sea-side town, he was spoken of as "the officer who knelt at church."

Charles was generally serving in frigates or

sloops. At one time he was absent from England for seven years together. In 1850 he went out in the *Hastings* in command of the East India and China station; but on the breaking out of the Burmese war, he transferred his flag to a steam sloop, for the purpose of getting up the shallow waters of the Irrawaddy, on board of which he died of cholera in 1852, in the seventy-fourth year of his age. His sweet temper and affectionate disposition, in which he resembled his sister Jane, had secured to him an unusual portion of attachment, not only from his own family, but from all the officers and common sailors who served under him. One who was with him at his death has left this record of him:

"Our good Admiral won the hearts of all by his gentleness and kindness, while he was struggling with disease, and endeavoring to do his duty as Commander-in-chief of the British naval forces in these waters. His death was a great grief to the whole fleet. I know that I cried bitterly when I found he was dead."

These two brothers have been dwelt on because their honorable career accounts for Jane Austen's partiality for the navy, as well as for the readiness and accuracy with which she wrote about it. She was always very careful not to meddle with matters which she did not thoroughly understand. She never touched upon politics, law, or medicine; but with ships and sailors she felt herself at home, or at least could always trust to a brotherly critic to keep her right. It is said that no flaw has ever been found in her seamanship either in "Mansfield Park" or in "Persuasion."

The first twenty-five years—more than half of the brief life of Jane Austen—were spent in the parsonage of Steventon, a small rural village upon the chalk hills of North Hants, situated in a winding valley about seven miles from Basingstoke. It is not a picturesque country. The surface continually sinks and swells, but the hills are not bold, nor the valleys deep; and though it is sufficiently well clothed with woods and hedgerows, yet the poverty of the soil in most places prevents the timber from attaining a large size. Still, it has its beauties. The lanes wind along in a natural curve, continually fringed with irregular borders of native turf, and lead to pleasant nooks and corners.

Of this somewhat tame country, Steventon, from the fall of the ground and the abundance of its timber, was one of the prettiest spots. The house where the Austens lived stood in a shallow valley, surrounded by sloping meadows, well sprinkled with elm-trees, at the end of a small village of cottages, each provided with a garden, straggling along on either side of the road. The chief beauty of Steventon consisted in its hedgerows. In that country a hedgerow does not mean a thin formal line of quickset, but an irregular border of copse-wood and timber, often wide enough to contain within it a winding foot-path or rough cart track. Two such hedgerows radiated from the parsonage garden; one westward, called "the wood walk,"

STEVENTON PARSONAGE.

furnished here and there with rustic seats; the other leading over the hill, and named "the church walk," because it led to the parish church, as well as to a fine old manor-house of the time of Henry VIII. The church itself, at that time

A little spireless fane,
Just seen above the woody lane,

might have appeared mean and uninteresting to an ordinary observer; but the adept in church architecture would have known that it must have stood there some seven centuries, and would have found beauty in the narrow English windows, as well as in the general proportions of its little chancel; while its solitary position, far from the hum of the village, and within sight of no habitation, except a glimpse of the gray manor-house through its circling screen of sycamores, has in it something solemn and appropriate to the last resting-place of the silent dead. Sweet violets, both purple and white, grow in abundance beneath its south wall. One may imagine for how many centuries the ancestors of those little flowers have occupied that undisturbed, sunny nook, and may think how few living families can boast as ancient a tenure of their land. Large elms protrude their rough branches; old hawthorns shed their annual blossoms over the graves;

and the hollow yew-tree must be at least coeval with the church.

This was the residence of Jane Austen for twenty-five years. This was the cradle of her genius. These were the first objects which inspired her young heart with a sense of the beauties of nature. In strolls along those wood walks, thick-coming fancies rose in her mind, and gradually assumed the forms in which they came forth to the world. In that simple church she brought them all into subjection to the piety which ruled her in life, and supported her in death.

The home at Steventon must have been, for many years, a pleasant and prosperous one. The family was unbroken by death, and seldom visited by sorrow. Their situation had some peculiar advantages beyond those of ordinary rectories. Steventon was a family living. Mr. Knight, the patron, was also proprietor of nearly the whole parish. He never resided there, and consequently the rector and his children came to be regarded in the neighborhood as in some sort representatives of the family. They shared with the principal tenant the command of an excellent manor, and enjoyed, in this reflected way, some of the consideration usually awarded to landed proprietors. They were not rich, but, aided by Mr. Austen's powers of

teaching, they had enough to afford a good education to their sons and daughters, to mix in the best society of the neighborhood, and to exercise a liberal hospitality to their own relations and friends. A carriage and a pair of horses were kept. This might imply a higher style of living in our days than it did in theirs. There were then no assessed taxes. The carriage, once bought, entailed little further expense; and the horses, probably, were often employed in farm work. Moreover, it should be remembered that a pair of horses in those days was almost necessary, if ladies were to move about at all; for neither the condition of the roads nor the style of carriage-building admitted of any comfortable vehicle being drawn by a single horse. When one looks at the few specimens still remaining of coach-building in the last century, it strikes one that the chief object of the builders must have been to combine the greatest possible weight with the least possible amount of accommodation.

The style of living in England when Jane Austen was a child was very different from what it is in our day. The dinner-table in country houses presented a more plain and substantial appearance. There was little glitter of plate, and even silver forks had not come into general use. The dinners themselves were more homely, though not less plentiful and savory; and the bill of fare in one house would not be so like that in another as it is now, for family recipes were held in high estimation. A grandmother of culinary talent could bequeath to her descendant fame for some particular dish, and might influence the family dinner for many generations. One house would pride itself on its ham, another on its game-pie, and a third on its superior pudding. Beer and home-made wines, especially mead, were more largely consumed. Vegetables were less plentiful and less various. Potatoes were used, but not so abundantly as now; and there was an idea that they were to be eaten only with roast meat. They were novelties to a tenant's wife who was entertained at Steventon parsonage, certainly less than a hundred years ago; and when Mrs. Austen advised her to plant them in her own garden she replied, "No, no; they are very well for you gentry, but they must be terribly *costly to raise*."

But a still greater difference would be found in the furniture of the rooms, which would appear to us lamentably scanty. There was a general deficiency of carpeting in sitting-rooms, bedrooms, and passages. A piano-forte, or rather a spinnet or harpsichord, was by no means a necessary appendage. It was to be found only where there was a decided taste for music, not so common then as now, or in such great houses as would probably contain a billiard-table. There would often be but one sofa in the house, and that a stiff, angular, uncomfortable article. There were no deep easy-chairs, nor other appliances for lounging; for to lie down, or even to lie back, was a luxury

permitted only to old persons or invalids. It was said of a nobleman, a personal friend of George III., and a model gentleman of his day, that he would have made the tour of Europe without ever touching the back of his traveling-carriage. But perhaps we should be most struck with the total absence of those elegant little articles which now embellish and encumber our drawing-room tables. We should miss the sliding book-cases and picture-stands, the letter-weighting machines and envelope-cases, the periodicals and illustrated newspapers—above all, the countless swarm of photograph books which now threaten to swallow up all space. A small writing-desk, with a smaller work-box or netting-case, was all that each young lady contributed to occupy the table; for the large family work-basket, though often produced in the parlor, lived in the closet.

How far the family life of Jane Austen conformed to this general picture her biographer leaves the reader somewhat in the dark. He mentions two little matters, however, which certainly differ from modern customs. One is, that when the young men went out before the family breakfast-hour, for shooting or hunting, they generally took their morning meal in the kitchen—a practice to which, in these days, servants would object quite as much as masters. The other is, that when the roads were dirty the sisters took long walks in pattens. This defense against wet and dirt is now seldom seen. The few that remain are banished from good society, and are employed only in menial work; but a hundred and fifty years ago they were celebrated in poetry, and considered so clever a contrivance that Gay, in his "Trivia," ascribes the invention to a god stimulated by his passion for a mortal damsel, and derives the name "patten" from "Patty."

"The patten now supports each frugal dame,
Which from the blue-eyed Patty takes the name."

But mortal damsels have long ago discarded the clumsy contrivance. First it dropped its iron ring and became a clog; afterward it was refined down into the pliant India rubber—lighter to wear and more effectual to protect.

The general coloring of Jane Austen's life was bright. She lived with indulgent parents, in a cheerful home which afforded an agreeable variety of social intercourse. To these sources of enjoyment must be added, in her case, the first stirrings of genius in her mind, and the absorbing interest of original composition. She began to write at a very early age. There is extant an old copy-book of hers, containing several tales, some of which seem to have been composed while she was quite a little girl. These stories are of a slight and flimsy texture, and are generally intended to be nonsensical; but the nonsense has much spirit in it. Perhaps the most remarkable thing about them is the pure and idiomatic English in which they are composed, quite different from the over-ornamented style which might be expected from

STEVENTON MANOR-HOUSE.

a very young writer. She herself was afterward of opinion that she had devoted too much time to composition at this period of her life; for she advised a niece, who had shown an early aptitude for such pursuits, to write no more till she should be turned sixteen, adding that it would have been better for herself if she had read more, and written less, before that age. But between these childish effusions and the composition of her living works, there intervened another stage of her progress, during which she produced several tales, not without merit, but which she considered unworthy of publication. During this preparatory period her mind seems to have been working in a very different direction from that into which it ultimately settled. Instead of presenting faithful copies of nature, these tales were generally burlesques, ridiculing the improbable events and exaggerated sentiments which she had met with in sundry silly romances. The family have declined to let these early works be published. Mr. Shortreed observed very pithily of Walter Scott's early rambles on the borders, "He was makin' himsel' a' the time; but he didna ken, maybe, what he was about till years had passed. At first he thought of little, I dare say, but the queerness and the fun." And so, in an humbler way, Jane Austen was "makin' hersel'," little thinking of future fame, but caring only for "the queerness and the fun;" and it would be as unfair to expose this preliminary process to the world, as it would be to display all that goes on behind the curtain of the theatre before it is drawn up.

It was, however, at Steventon that the real foundations of her fame were laid. There some of her most successful writing was com-

posed, at such an early age as to make it surprising that so young a woman could have acquired the insight into character and the nice observation of manners which they display. "Pride and Prejudice," which some consider the most brilliant of her novels, was the first finished, if not the first begun. She began it in October, 1796, before she was twenty-one years old, and completed it in about ten months, in August, 1807. The title then intended for it was "First Impressions." "Sense and Sensibility" was begun, in its present form, immediately after the completion of the former, in November, 1797; but something similar in story and character had been written earlier under the title of "Elinor and Marianne;" and if, as is probable, a good deal of this earlier production was retained, it must form the earliest specimen of her writing that has been given to the world. "Northanger Abbey," though not prepared for the press till 1803, was certainly first composed in 1798.

In 1801, Mr. Austen, then seventy years of age, determined to resign his duties to his eldest son, who was to be his successor in the rectory of Steventon, and to remove with his wife and daughters to Bath. Jane was absent from home when this resolution was taken; and, as her father was always rapid both in forming his resolutions and in acting on them, she had little time to reconcile herself to the loss of her first home. Their life at Bath was very quiet. In February, 1805, Mr. Austen died, and a few months afterward the mother and daughters removed to Southampton. The only record of the four years passed in Bath are two letters from Jane to her sister, which are mainly interesting as showing that she went a good deal into so-

ciety, in a quiet way, chiefly with ladies; and that her eyes were always open to minute traits of character in those with whom she associated.

In 1809, Mrs. Austen's second son, who had been adopted by a wealthy cousin, Mr. Knight, of Godmersham Park in Kent and Chawton House in Hampshire, whose name he had assumed on coming into possession of the property, was able to offer her the choice of two houses on his estates. She chose one near Chawton House, and removed there with her daughters. Chawton Cottage may be called the second, as it was the last, home of Jane Austen; for at Bath and Southampton she was only a sojourner in a strange land, but here she found a real home among her own people. It was also the place most closely connected with her career as a writer; for here, in the maturity of her mind, she either wrote or rearranged and prepared for publication the books by which she has become known to the world. Here, also, a few years later, while still in the prime of life, she began to droop, and went away only at the earnest persuasion of her friends in the last stage of her fatal illness.

At the time of her removal to Chawton Cottage, Jane Austen was very attractive in person: her figure was rather tall and slender, her step light and firm, and her whole appearance expressive of health and animation. In complexion she was a clear brunette with a rich color; she had full round cheeks, with mouth and nose small and well formed, bright hazel eyes, and brown hair forming natural curls close round her face. If not so regularly handsome as her sister, yet her countenance had a peculiar charm of its own to the eyes of most beholders. At this time she never was seen, either morning or evening, without a cap. She and her sister were generally thought to have taken to the garb of middle age earlier than their years or their looks required; and that, though remarkably neat in their dress as in all their ways, they were scarcely sufficiently regardful of the fashionable or the becoming.

She was not highly accomplished according to the present standard. Her sister drew well, and it is from a drawing of hers that the likeness prefixed to this article has been taken. Jane herself was fond of music, and had a sweet voice, both in singing and in conversation; in her youth she had received some instruction on the piano-forte; and at Chawton she practiced daily, chiefly before breakfast. In the evening she would sometimes sing, to her own accompaniment, some simple old songs, the words and airs of which, now rarely heard, still linger in the memory of old people. She read French with facility, and knew something of Italian. In those days German was no more thought of than Hindostanee, as part of a lady's education. In history she followed the old guides—Goldsmith, Hume, and Robertson. When a girl she had strong political opinions, especially about the affairs of the sixteenth and seventeenth centuries. She was

a vehement defender of Charles I. and his grandmother Mary; but this was rather from an impulse of feeling than from any inquiry into the evidences by which they must be condemned or acquitted. As she grew up, the politics of the day occupied very little of her attention, but she probably shared the feeling of moderate Toryism which prevailed in her family. She was well acquainted with the old periodicals, from the *Spectator* downward. Her knowledge of Richardson's works was such as no one is likely again to acquire, now that the multitude and the merits of our light literature have called off the attention of readers from that great master. Every circumstance narrated in Sir Charles Grandison, all that was ever said or done in the cedar parlor, was familiar to her; and the wedding-days of Lady L. and Lady G. were as well remembered as if they had been living friends. Among her favorite writers, Johnson in prose, Crabbe in verse, and Cowper in both, stood high. Scott's poetry gave her great pleasure; she did not live to make much acquaintance with his novels. Only three of them were published before her death.

It was not, however, what she knew, but what she was, that distinguished her from others. The fascination which she exercised over children can not be better described than by quoting the words of one of her nieces. She says:

"As a very little girl I was always creeping up to Aunt Jane and following her whenever I could, in the house and out of it. I might not have remembered this but for the recollection of my mother's telling me privately that I must not be troublesome to my aunt. Her first charm to children was great sweetness of manner. She seemed to love you, and you loved her in return. This, as well as I can now recollect, was what I felt in my early days before I was old enough to be amused by her cleverness. But soon came the delight of her playful talk. She could make every thing amusing to a child. Then, as I got older, when cousins came to share the entertainment, she would tell us the most delightful stories, chiefly of Fairyland, and her fairies had all characters of their own. The tale was invented, I am sure, at the moment, and was continued for two or three days if occasion served."

Her unusually quick sense of the ridiculous led her to play with all the commonplaces of everyday life whether as regarded people or things; but she never played with its serious duties or responsibilities, nor did she ever turn individuals into ridicule. With all her neighbors in the village she was on friendly, though not intimate terms. She took a kindly interest in their proceedings, and liked to hear about them. They often served for her amusement; but it was her own nonsense that gave zest to the gossip. She was as far as possible from being either censorious or satirical. The laugh which she occasionally raised was by imagining for her neighbors, as she was equally ready to imagine for her friends or herself, impossible contingencies, by relating in prose or verse some trifling anecdote colored to her own fancy, or in writing a fictitious history of what they were supposed to have said or done, which could deceive nobody.

THE CHURCH AT CHAWTON.

Jane Austen was successful in every thing that she attempted with her fingers. No one could throw spilkins in so perfect a circle, or take them off with so steady a hand. Her performances with cup and ball were marvelous. The one used at Chawton was an easy one, and she has been known to catch it on the point above a hundred times in succession till her hand was weary. She sometimes found a resource in that simple game, when unable, from weakness in her eyes, to read or write long together. Her handwriting was clear and strong. Happy would the compositors for the press be if they had always so legible a manuscript to work from. But the writing was not the only part of her letters which showed superior handiwork. In those days there was an art in folding and sealing. No adhesive envelopes made all easy. Some people's letters always looked loose and untidy; but her paper was sure to take the right folds, and her sealing-wax to drop into the right place. Her needle-work, both plain and ornamental, was excellent, and might almost have put a sewing-machine to shame. She was considered especially great in satin stitch. She spent much time in these occupations, and some of her merriest talk was over clothes which she and her companions were making, sometimes for themselves and sometimes for the poor.

The first year of Jane Austen's residence at Chawton seems to have been devoted to revising and preparing for the press "Sense and

Sensibility" and "Pride and Prejudice;" but between February, 1811, and August, 1816, she began and completed "Mansfield Park," "Emma," and "Persuasion," so that the last five years of her life produced the same number of novels with those which had been written in her early youth. How she was able to effect all this is surprising; for she had no separate study to retire to, and most of the work must have been done in the general sitting-room, subject to all kinds of casual interruptions. So much having been prepared beforehand, when once she began to publish, her works came out in quick succession. "Sense and Sensibility" was published in 1811, "Pride and Prejudice" at the beginning of 1813, "Mansfield Park" in 1814, "Emma" early in 1816; "Northanger Abbey" and "Persuasion" did not appear till after her death, in 1818. The profits of those which had been printed before her death had not at that time amounted to seven hundred pounds. Her first attempts at publication were discouraging. The manuscript of "Pride and Prejudice" was declined without a reading; and that of "Northanger Abbey," after being sold for ten pounds, lay for many years in the publisher's drawer, until it was gladly relinquished for the original purchase-money.

Her literary fame was of slow but certain growth. At first received with but little favor by the public or the reviewers, her novels have won an honorable and permanent position in

English literature. Southey writes of them, in a letter to Sir Egerton Brydges: "You mention Miss Austen. Her novels are more true to nature, and have, for my sympathies, passages of finer feeling, than any others of this age." Coleridge praised them as "being, in their way, perfectly genuine and individual productions." The admiration felt by Lord Macaulay for the character and literary talents of Miss Austen would probably have taken a practical form if his life had been prolonged. It is stated, on the authority of his sister, Lady Trevelyan, that he had intended to write a memoir of Miss Austen, with criticisms on her works, to prefix it to a new edition of her novels, and from the proceeds of the sale to erect a monument to her memory in Winchester Cathedral. Sir Henry Holland, in his printed but unpublished recollections of his past life, says:

"I have the picture still before me of Lord Holland lying on his bed, when attacked with gout, his admirable sister, Miss Fox, beside him, reading aloud, as she always did on these occasions, some one of Miss Austen's novels, of which he was never wearied. I well recollect the time when these charming novels, almost unique in their style of humor, burst suddenly on the world. It was sad that their writer did not live to witness the growth of her fame."

The most interesting as well as the most hearty testimony to the merits of Miss Austen's novels came from the pen of Sir Walter Scott, who wrote as follows, in his diary for March 14, 1826:

"Read again, for the third time at least, Miss Austen's finely written novel of 'Pride and Prejudice.' That young lady had a talent for describing the involvements and feelings and characters of ordinary life which is to me the most wonderful I ever met with. The big bow-wow strain I can do myself like any now going; but the exquisite touch which renders ordinary commonplace things and characters interesting, from the truth of the description and the sentiment, is denied to me. What a pity such a gifted creature died so early!"

Jane Austen's health began to fail in the early part of 1816, and before summer came her strength had declined so low as to confine her to the house. Gradually, too, her habits of activity within doors ceased, and she was obliged to lie down much. The sitting-room contained only one sofa, which was frequently occupied by her mother, who was more than seventy years old. Jane would never use it, even in her mother's absence; but she contrived a sort of couch for herself with two or three chairs, and was pleased to say that this arrangement was more comfortable to her than a real sofa. Her reasons for this might have been left to be guessed but for the importunities of a little niece, which obliged her to explain that if she herself had shown any inclination to use the sofa, her mother might have scrupled being on it so much as was good for

her. Her mind, however, did not share in the general decline of her bodily strength. While unable to sit up, she rewrote several chapters of her last novel, "Persuasion," with a vigor of imagination and force of style unsurpassed in any of her former works. In the spring of 1817 she was persuaded to remove to Winchester, to obtain superior medical advice; but all that was gained by the removal from home was the satisfaction of having done the best that could be done, together with such alleviations of suffering as the highest medical skill could afford. She was fully aware of her danger, though not appalled by it. It is true, there was much to attach her to life. She was happy in her family; she was just beginning to feel confidence in her own success; and, no doubt, the exercise of her great talents was an enjoyment in itself. We may well believe that she would gladly have lived longer; but she was enabled, without dismay or complaint, to prepare for death. She was a humble, believing Christian. Her life had been passed in the performance of home duties and the cultivation of domestic affections, without any self-seeking or craving after applause. She had always sought, as it were by instinct, to promote the happiness of all who came within her influence, and doubtless she had her reward in the peace of mind which was granted her in her last days. Her sweetness of temper never failed. She was ever considerate and grateful to those who attended on her. At times, when she felt rather better, her playfulness of spirit revived, and she amused them even in their sadness. When the end at last came she sank rapidly, and on being asked by her attendants whether there was any thing that she wanted, her reply was, "Nothing but death." These were the last words spoken by Jane Austen. In quietness and peace she breathed her last on the morning of July 18, 1817.

On the 24th of that month she was buried in Winchester Cathedral, near the centre of the north aisle, almost opposite to the beautiful chantry tomb of William of Wykeham. A large slab of black marble in the pavement marks the place. Her own family only attended the funeral. Her sister returned to her desolated home, there to devote herself, for ten years, to the care of her aged mother, and to live much on the memory of her lost sister, till called many years later to rejoin her. Her brothers went back sorrowing to their several homes. They were very fond and very proud of her. They were attached to her by her talents, her virtues, and her engaging manners; and each loved afterward to fancy a resemblance in some niece or daughter of his own to the dear sister Jane, whose perfect equal they yet never expected to see.

A DREAM OF FAIRIES.

It was Summer, it was June;
 Slept the sun in western bowers;
 Up had risen the round moon:
 Fainting with the breath of flowers
 Hushed the air its leafy tune.
 Faint gray clouds upon the sky,
 Where the failing zephyrs blew them,
 Here and there hung, far and high;
 And the stars were winking through them
 With a dim and sleepy eye.
 Every where, on every side,
 Quiet breathing, rest of Summer,
 And luxurious peace, denied
 Unto Spring, the riotous comer,
 Rashly wooing his coy bride.
 Helen, sitting on the grass,
 Just within a grove of beeches
 (Like a Fairy kingdom 'twas)
 Gazed adown the sylvan reaches,
 Where the Fairy Queen may pass;
 Mystic hollows, shadows gray,
 And a play of silvery shimmer;
 Rock and tree-trunk, leaf and spray,
 Seemed, in that uncertain glimmer,
 Ghosts of what they were by day.
 By the great trees over-boughed,
 Flecked with shadows and moon-glances,
 Sat she, still and thoughtful-browed,
 Dreaming a whole world of fancies;
 Not a word of them aloud!

In the shadow of the boughs
 Thus ran on her dim-eyed fancy
 (For the goddess of sweet vows
 With the subtlest necromancy
 Every lover's brain endows):

"Fie, ye Fairies! So remiss!
 Forty minutes have I waited
 For those graceful courtesies
 Done to straying folk, belated
 In old time beneath the trees.

"Have ye fled away from earth,
 From our mountains and our valleys,
 From the castle, from the hearth,
 From the winding forest alleys,
 Taking all your tricky mirth?

"Where is all the frolic crowd
 Footed meadows in times olden,
 When the air breathed not aloud,
 And the moon, full-faced and golden,
 Walked through heaven without a cloud?

"Whereto have ye fled and gone,
 Since King Arthur's time, I wonder?
 To the top of mountains flown?
 To the dismal regions under,
 Where the sunlight never shone?

"Whereto have ye disappeared?
 Round the planets hiding, seeking?
 Plucking comets by the beard?
 Down yon pathway dancing, feaking,
 Where no human step is feared?

"Wherefore have ye left our brooks,
 Glens and groves and meadows, friendless?
 Sigh ye not for those old nooks?
 Have ye found, in regions endless,
 Haunts with half so lovely looks?

"Answer none!— Ah, nevermore
 In the woodlands shall we view them,
 Nor on grassy meadow-floor;
 Nor by falling waters woo them
 To us, as in days of yore.

"Nevermore, in lonely wood,
 Maids shall hear dim strains alluring,
 Strains that can not be withstood;
 Something that's divine assuring
 Nothing shall be met but good.

"Could we turn earth back again,
And those olden days recover!
Some high lady were I then,
And a glorious knight my lover,
Noblest, famous of men;

"Through the wide world nobly famed
For his gentleness and valor;
By the poor down-trodden claimed;
Wrong's dark cheek would turn to pallor
But to hear his scutcheon named!

"But his noble heart would be
Mine, though we were realms asunder;
And, when victory left him free,
He would come back, to sit under
The old oak-tree boughs with me.

"For a castle should be ours,
Many-towered, high-walled, deep-moated,
Ringed with groves, and lawns, and flowers;
Founts from marble basins spouted,
Falling back in silvery showers.

"Underneath the old oak-trees
With green chaplets I would crown him;
Do him dearer courtesies
Than a queen could smile upon him
For his famous victories;

"While my noble knight would tell
Hard adventures, wild and daring:
How the wizard-robber fell,
And the flames, the midnight scaring,
Shot up from his citadel;

"How the potent Fairy King
Was his Genius and his leaguer;
Of the wondrous Horn and Ring;
And the Goblet, to lips eager
With wine gushing, like a spring;

"How he passed through forests old,
Haunts of drear, mysterious dangers,
Where the Giants have their hold,
And the scaly Dragon-rangers
Guard enchanted heaps of gold;

"How the— Hush! what strains are those?
Some enchantment o'er me creeping?"—
Soft and slow her eyelids close—
She droops sideways—she is sleeping,
While the music ebbs and flows;

Sleeping, cheek upon her arm,
Her unknotted hair loose straying;
Naught can fall to her of harm
With the placid moonlight playing
On her eyelids like a charm.

Lo, a thousand merry sprites,
Their lithe bodies sparkling, flashing,
Shower of animated lights,
Like the crystal rain a dashing
Wind from frosty branches smites;

Round about her, on the ground,
In the silvered air above her,
To the small, sweet, tinkling sound
Merrily skip, dance, and hover,
Singing this fantastic round:

"Happy and free,
Merrily we
Flit through the dells,
Sleep in the cells
Of flower cups and bells.
Zephyr and Moonlight
Know where we bide,
Hidden from noonlight,
Snugly we hide!
Zephyr, Moonlight, never tell
Where the Fairy people dwell!"

Tu whit tu whoo! tu whit tu whoo!
Sleep and Fairies fly together.
From the grove glides Helen, too,
Slowly, slowly, wondering whether
It was all a dream, or true.

THE OLD LOVE AGAIN.

By ANNIE THOMAS.

THE ARRIVAL.

CHAPTER I.

ARDLEIGH VICARAGE.

EVERY body declared that it was a model vicarage, in tones that implied that the requirements of vicars and vicaresses are essentially different to those of other people on the same level in life. It stood at the end of a compact, smiling little village, that was invariably blushing pink in spring with a wealth of apple blossom, and in autumn and winter was even of a richer hue from an ample drapery of Virginian creepers.

Flourishing, or at least bright and cheerful, as the general aspect of Ardleigh was, it was the favorite haunt of faded respectability. Innumerable maiden ladies dwelt about in its pretty detached cottages—maiden ladies who carried about with them an air of gloomy conviction that they had seen better days. Yet in the majority of cases they were indigenous to the Ardleigh soil, and the days were, when

thoroughly investigated, only “better” than the present ones in that they were past.

There was a good deal of what may be termed lantern and patten society going on in Ardleigh. Decayed respectability was apparently insatiable in the matter of giving and receiving tea and toast at each other’s houses. But as Mrs. Eldon, the wife of the recently appointed vicar, said, “For those who were insensible to the pleasures of tea and toast, there was no more piquant diet to be had in Ardleigh.”

Just at the time of this small history of its inhabitants opening, Ardleigh was rather in an excited state about these Eldons. They were young newly-married people, and the manner of their advent had been startling, not to say scandalizing, to the Ardleigh mind. Their furniture had preceded them by three or four days, and had been arranged according to the pure and perfect taste of the packers who had accompanied it. And Mr. and Mrs. Eldon had

arrived on horseback in company with two magnificent dogs—a mastiff and a blood-hound—just as the shades were coming on one lovely July evening. It was not at all the sort of first appearance that the Ardleigh people could approve of. The wives of one or two clergymen, and the daughters of two or three more in the neighborhood, did ride certainly without any sacrifice of either virtue or respectability. But there was this saving clause about the fact, that they did not ride well; whereas Mrs. Eldon rode like a bird, or rather like a woman to whom riding has come both by nature and by art. It was proposed and carried without hesitation at every Ardleigh supper-table that night, that no woman who could swerve so lithely with every movement of a prancing horse could be quite fit for a parson's wife. The pudgy appearance of the wife of their late lamented vicar, and the names of his awkward squad of daughters, were recalled with affectionate regret; and more than one village Cassandra foreboded dark things of a lady who rode as well as Lord Ennington's daughters, without, to their knowledge, having as good blood in her veins or as much gold in her purse. Undoubtedly it was a model vicarage, but she was not a corresponding vicaress.

It is time to describe the favored spot. It stood at one end of the village, well away from all the other houses, in the midst of a fair, undulating, moderately well wooded, park-like piece of meadow-land. A lawn, divided from this meadow-land by an invisible fence, stretched in front of the creeper-covered house. The drawing-room end was Elizabethan; pretty buttressed bay-windows reached from within a foot of the floor to the ceiling. There was a touch of the Tudor about the architecture of the centre of the house. And the long, plain, red wall, enlivened by white-sashed narrow windows of the exterior of the dining-room and library, was unmistakably seventeenth century. Altogether these incongruities were very charming, smoothed down and enriched as they were by a gorgeous drapery of wisteria, roses of all kinds (especially one moss-rose of a deep crimson, whose blooms stretched away to the chimneys), Virginian creepers, clematis, jasmine, and myrtle.

Inside, under the Eldon régime, the house was equally pretty, picturesque, and comfortable. The drawing-room with the Elizabethan windows had a groined ceiling, and paneled walls of dark oak. The cornice was well carved, and the mantle-piece matched it. Satyrs, gnomes, tiny boys with wings, creatures half human, half floral, and other quaint conceits that are only to be found in carved oak, wreathed themselves round the room and the fire-place. The Eldons sustained the one-color idea well in this room, for they had it furnished with a certain tawny velvet of precisely the same shade as the carved oak where the high lights fell on chubby cheeks and other protuberances. Then there was a dining-room, and a study, and a parish-room, and in them all were evi-

dences of refined taste and cultivation. But the brightest, most refined, and cultivated thing in the whole house was the fair-haired mistress of it, who had been going from bad to worse in the estimation of some of the Ardleigh people ever since that first iniquitous entrance of hers on a chestnut horse, in the dying light of a July day.

It had been surmised timidly first, and asserted authoritatively afterward, that Mr. Eldon would be sure to neglect his parish for the sake of riding with his wife—"who's a perfect Amazon," the Ardleighites would say to each other, without having very clear ideas as to what the habits and customs of the genus referred to had been. But it speedily transpired that Mr. Eldon did not neglect his parish, nor did Mrs. Eldon go out and do deeds of arms, or in any way merit the appellation that had been bestowed upon her. On the contrary, they both went on their way very quietly, if very joyfully, and the sins of omission of the one were as difficult to detect as those of commission of the other.

The greatest people in Ardleigh were the Barringtons. In fact, they were the only great people in Ardleigh; but they made up for the deficiencies of others by being very great indeed. They had been resident in the place about four years when the Eldons came, and during that time they had always laid down the social law, and "carried on" with a profound air of conviction in themselves, and all that appertained unto them, being of the most unimpeachable order. Mr. Barrington was about thirty at this epoch, and his wife was three or four years younger. He had come into the place with capital credentials—plenty of money, good inclination to spend it, and letters of introduction to Lord Ennington and other county magnates. A light-hearted, good-looking, agreeable-mannered man of the world, a hearty host, a splendid shot, and a crack rider, he soon made his way in the neighborhood, and was universally accepted by men as one of the best fellows going, and by women as "that charming Mr. Barrington." But his wife did not gain ground either so fast or so firmly. She was marked a failure from the very first by the society that so readily admitted her husband, and she did not care for the old village ladies, who would have adored her and asked her to tea every night of their lives, if only she would have gone.

How this pair came to be joined together in the bonds of holy matrimony was an incomprehensible mystery. What spell had been over the handsome, traveled, accomplished young gentleman, when he linked himself for life with the boisterous, uncultivated, unprepossessing woman who bore his name and did the honors of his house? Large, tall, with brilliant dark eyes, a bright color, a nose that was sufficiently straight, but that was coarse, with that most repulsive coarseness of thickness and shortness; with shoulders that sloped in a way that was

the admiration of the dress-makers who clothed them; with a loud voice, a great habit of laughter, and an elastic gait, Mrs. Barrington was the very type of that order of women from whom it would have been natural to suppose her husband would have shrunk with horror.

A more curious fact concerning him, a stranger one, even, than his marriage with her, was this: careful as he was in his conduct to others, fully and completely as he discharged all the claims society had on him, sensitive as he was about many things, refined as he was about most things, he still never resented the invariable inattention and the occasional barely-concealed contempt with which his wife was treated by other women. It was in vain that, in their hours of seclusion, she would beg him to be cool to families, the ladies of which would not fall into confidential friendships with her. "I have given you to understand from the first that I can't help you there, Harriet," was his unvarying reply. "In the battle of woman against woman no man can take a part."

"But there is no reason why those stuck-up daughters of Lord Ennington should be against me. I am always willing to be jolly to them, and to ask them to my house to meet young men. We might have rare fun if only you'd teach them that I am as good as they are," Mrs. Barrington would say, with a sort of pouting vivacity that was the next most unendurable thing to her affable boisterousness.

"I should teach them that lesson very imperfectly," he would say, coldly; and to himself he would add, "for it is one I can not teach myself."

Still, for all this soreness of spirit on Mrs. Barrington's part, and for all the dire snubbings she was wont to receive, the Barringtons held their ground in Ardleigh as great people. Ardleigh End, the house they had bought, was a good house, emphatically, and its inhabitants had always been well visited and well reputed. In a country neighborhood traditions of respectability and honor cling about a house as much as about a family; so, by means of her husband and her habitation, the present mistress of Ardleigh End got accepted, though not exactly on terms that were agreeable to herself.

The Eldons had supplied all that there was of conversation, and had been subjects for all that there was of thought, in Ardleigh about three weeks, when the mistress of Ardleigh End went down to the vicarage in all that she could command of state to call on Mrs. Eldon. Mrs. Barrington told herself that her hour of triumph was come. These Eldons were said to be very well connected, but not too well off; therefore she (Mrs. Barrington) would be able to patronize and befriend them. It was a very sweet thought, and the woman bridled, and glowed, and giggled to herself as she indulged in it; and ceased to indulge in it the minute she was ushered into Mrs. Eldon's presence.

The mistress of the house rose from a low chair placed in the embrasure of one of the

Elizabethan windows, as Mrs. Barrington came into the room. Mrs. Eldon was not the sole occupant of the room, but she claims the first mention. A fair, beautiful, yellow-haired lady, singularly graceful in her gestures, singularly self-possessed in her manner, singularly quiet (so Mrs. Barrington thought) in her demeanor. A perfect type of a young British matron, looking full of life and happiness—and looking it withal so quietly that a sudden fear that, "after all, they shouldn't be so jolly together," smote Mrs. Barrington.

The other occupant of the room looked up quickly and glanced away carelessly, as Mrs. Barrington's name was announced.

This other occupant was a lady also. A young lady of about three or four and twenty. For a moment, as Mrs. Eldon said, "My friend, Miss Delany," Miss Delany desisted from her occupation, and inclined her head in almost lazy acknowledgment of the introduction. The next instant she resumed her pastime of playing with the great tawny ears of the bloodhound, and seemed to forget Mrs. Barrington's existence.

She was recalled to a sense of it, presently, by hearing Mrs. Barrington say, "Yes, indeed, Ardleigh is a dull place for those who haven't plenty of money and plenty of society. Gerald and I have lived here for four years, and we find it delightful." As she finished her speech she saw that Miss Delany's eyes were fixed upon her, and fancying her statement had been a striking and envy-creating one, she felt glad that she had made it.

Miss Delany's eyes were very peculiar. They were of such a deep gray that when her back was to the light they looked almost black. They were set in straight under a white forehead, which in its turn was surmounted by rippling masses of golden-chestnut hair. Her complexion was creamy, colorless; yet she did not look in the least degree delicate. There was an undulating line in her nose, and a degree of nervous flexibility about her lips that betokened the possession of an imaginative temperament. Her figure was full, ripe, rich, and flexible as her lips; and the languor in which she seemed to be steeped, the air of lassitude with which she was fraught, rendered her striking, remarkable, attractive.

"How long did you say you had lived at Ardleigh End?" she asked, in tones about which there was the odor, as it were, of the Irish accent, they were so faint and sweet.

"Four years," Mrs. Barrington replied, with vivacious readiness to give all the information about herself and her manner of life that she could persuade Miss Delany to listen to. "We had not been married very long—not many months—it was a very sudden affair, our marriage. Gerald made up his mind he'd have me the very first time he saw me—"

"Did he, really?" Miss Delany said, coolly.

"Yes—really; it was one of the funniest things you ever heard of in your life. I was

staying with a friend of mine, Mrs. Hern, at a watering-place, and we were being as gay as we could be, and we used to meet Mr. Barrington, who was quite a recluse through ill health."

"And so you really like Ardleigh," Mrs. Eldon interrupted, in mercy to her wearied-looking young friend.

"Oh, I think it delightful," the effusive guest went on; "but then, Gerald would make any place agreeable to me; as I was telling you, he was called the recluse when we met him first; but I soon got him to come out of his shell, and then he wouldn't hear of any thing but our being married directly." And again the lady bounded about on her chair, in what she believed to be a juvenile and joyful manner, and Miss Delany rose up and walked out of the room.

"Your friend is really very pretty," Mrs. Barrington then said, affecting to sober down and speak seriously; "I am sure my husband will admire—I shall be quite jealous." This she said with an air of its being equally absurd and impossible that she should be rendered jealous by any mortal woman. "Is she related to you, Mrs. Eldon?"

"She is not. Can you recommend me to a florist?" Mrs. Eldon said, putting up her hand and breaking off a twig of double flowering myrtle, with an evident determination not to canvass Miss Delany that would have been apparent to a woman of even one shade better breeding than Mrs. Barrington could boast of. But Mrs. Barrington was quite impervious to the well-directed shot. Hastily mentioning the name of a florist in an adjoining town, she resumed the subject that was more interesting to herself at the moment by saying:

"I shall be quite pleased to introduce Miss Delany about, as you don't know many people yet. I am a capital chaperon," she continued, with a loud laugh that made Mrs. Eldon start. "I always let girls go rushing about just as they please; indeed, some people have told me I'm much too young to be a chaperon; but, as I always say, it's only the name of the thing, you know." This last sentence she spoke as if she meant it for Mrs. Eldon's instruction, with an air that said plainly that she took it for granted Mrs. Eldon did not know much about society yet; but that she (Mrs. Barrington) would be ready to be "guide, philosopher, and friend" to the vicar's wife.

"And where have you lived before you came here?" Mrs. Barrington continued, patronizingly.

"In many places," Mrs. Eldon said, curtly.

"Oh, indeed; traveled about, I suppose?"

Mrs. Eldon inclined her head slightly in the affirmative. Her guest was going beyond all the bounds of her patience.

"As companion, or with your own family?" Mrs. Barrington asked, with a hesitation that was due to her dread that her curiosity would not be gratified.

"As companion," Mrs. Eldon replied, with her eyes sparkling. She would have said "as cook," if she had felt sure that the statement would have relieved her of Mrs. Barrington's presence.

After one more attempt at finding out the antecedents of the new-comer Mrs. Barrington departed, and as soon as she was gone Mrs. Eldon ran up to Miss Delany's room. She knocked at the door hurriedly, then opened and found the girl standing at the window watching the Barringtons' carriage winding along the drive through the park-like meadow.

"Nina, you were wise to come away. She is the most overpoweringly awful woman it has ever been my lot to meet," Mrs. Eldon said, sinking down with an air of feigned exhaustion on the sofa.

"Doubly awful to me, Gertrude," Miss Delany said, turning round suddenly, and showing a tear-stained, agitated face. "I was engaged to Gerald Barrington once—and he has married her!"

"Will it hurt you to tell me of it, Nina?" Mrs. Eldon said, softly. And for answer Nina told the story of Gerald and herself.

CHAPTER II.

"—and pity us all

Who vainly the dreams of youth recall."

"I HAVE been calling on the new people at the Vicarage," Mrs. Barrington said to her husband when he joined her in their gorgeous drawing-room just before dinner that evening. They were alone, a misfortune that Mr. Barrington rarely suffered to befall him.

"Have you?" he answered, carelessly; and then dinner was announced, and they walked in and sat down to it with the quiet propriety that was so dull for her, and that was the sole thing that rendered his home-life endurable to him.

"You don't ask me what I think of them," she said presently, professing to pout a little.

"Oh, well, what do you think of them?"

"Not much of Mrs. Eldon," Mrs. Barrington said, decidedly. "I'm quite disappointed in her. How any body can call her lovely I can't think; besides, there is a certain sort of satirical manner about her that I don't like. I never could bear satirical people; besides, it's not at all becoming in a clergyman's wife, especially in one who wasn't very much before she married."

"Why should she have been 'very much' a clergyman's wife before she married?"

"I never said a word about that," Mrs. Barrington said, angrily. "You must be stupid not to know what I mean."

"Certainly your grammar is so strikingly original that I might have mastered the rudiments of it in all these years."

"Oh, never mind the old grammar!" Mrs. Barrington said, with the bouncing contempt which ladies of her order are apt to assume for

"LET ME TELL YOU...HOW I CAME TO MARRY AS I DID."—[SEE PAGE 243.]

all that they do not understand. "Never mind the old grammar. I want to tell you about a pretty girl who is staying with Mrs. Eldon. I have rather taken a fancy to her. I shall take her up. Mrs. Eldon seemed quite pleased when I told her I would introduce her friend about."

"And what did her friend seem?"

"Miss Delany had gone out of the room before I said it. I have found out, too, that Mrs. Eldon was nothing but a companion before she married. That's what I meant by saying she hadn't been very much—"

"Who had gone out of the room before you said it?" Mr. Barrington asked, quietly checking his wife's volubility.

"Miss Delany had. What is the name—French or Irish, should you think?"

"I'll tell you when I have thought about it," he said, slowly; and then he changed the subject by telling her that he thought he should be obliged to go up to town on business for a week or two; "and I will take you with me, if you like," he added.

"At any other time I should like it, but just now we ought to give a dinner to these Eldons;

and if we put it off too long Miss Delany may be gone; and it would be a pity to miss her, wouldn't it?"

"A pity to miss her—yes," he said, absently.

"I want you to see her. I told Mrs. Eldon you would be sure to admire her so that I should be quite jealous."

"You did not say that?" he said; and if the length of the table had not intervened she would have heard his teeth grinding together.

"I did say it. Of course they knew it was a joke," she said; and Gerald Barrington's brow burned as he thought how poor a joke Nina Delany would think it.

All that night he sat by himself; "busy writing," he sent word to his wife when the summons to go in to the drawing-room for tea was sent to him; but in reality thinking about the sweet time when Nina Delany had loved him, and the sad time it would be for him if this Miss Delany at the Vicarage should prove to be the same who had left him, and let him go to the matrimonial bad, to which he had gone incontinently.

It was a horrible question for a young hus-

band of four years to be asking himself. But he did ask it of himself repeatedly. What glamour had been over him that he should have thought to revenge himself upon Nina by marrying a woman so palpably, so painfully Nina's inferior? He had never loved his wife; he had never been attracted by one quality of hers, either of body or mind, for one instant. Yet, in his reckless infatuation, he had suffered the "low lot," as he dubbed her whole race, to persuade him that he was bound in honor to marry her. He hated her this night, as he thought of how boldly, and yet withal how craftily, she had woven her vulgar meshes about him. How she had pursued him and been ferociously friendly to him in a way that would not be rebuffed. He loathed her afresh as he remembered the coarse art with which she had simulated ingenuousness, wounded feeling, and the like, until, because he was weak and kind, and entirely off his guard, they fell upon him like a pack of ravening wolves, and avowed that by his attentions he had compromised her honor unless he made her his wife. "A curse on all such marriages," he had then said in his wrath. But he had married her, and the curse had come home to him—would come home to him more hardly still if he should be compelled to see his old love in the presence of his wife. His wife! the woman who caused his life to be one long blush. The woman whom he thanked God daily was not the mother of children of his. His wife! was he not paying an awfully heavy penalty of mortification and revulsion in being compelled to own her as such?

Gradually, as calmer feeling succeeded the blind annoyance which had overpowered him at first, it came to him to feel that it was just possible that the Miss Delany who was staying at the Eldons was not the same Nina Delany who rather more than four years ago had made every thing wrong in his life by her vacillation. If he went away to town without seeing this lady he might be a coward fleeing from nothing! On the other hand, if he went away to town after seeing her she might think him a coward for fleeing from her. So—as he really longed to see her—he told himself that it would be what was becoming in a man to stay and brave it out. "Nina can never despise me for having married *her* half as much as I despise myself," he thought, drearily, and his heart ached heavily, and his anger against his wife gave him no comfort.

Meanwhile Nina Delany had told the whole of the old, old story to her friend, Mrs. Eldon. "My father is much too attractive a man to care to be hampered with a grown-up daughter; you know that as well as I do, Gertrude?" Mrs. Eldon assented to this proposition rather mildly.

"Sir Arthur is very agreeable. But you must acknowledge he's as agreeable to you as to any body else, Nina."

"Quite—in society," Nina said, carelessly; "he would never spoil my chance by neglecting

me himself; all the same, he will be very glad to see me take leave of the home circle in a respectable way; I'm only impressing this upon you in order that you may understand that he favored Gerald Barrington quite as much as I did."

"How did you know Mr. Barrington first?"

"I met him about in my first year. He came down on the Guards' drag to a grand affair we had at Richmond one day, and he always was seen in the right places, and with the right men. I don't mind confessing it now, Gertrude—now that I am old and past that sort of thing, and he is married—but I was frantic about him—dreadfully in love with him. If he had turned out to be a coster-monger's son, I believe I should have stood to him."

"And what made you give him up?" Mrs. Eldon asked.

"He gave me a rival," the girl said, proudly, "and I couldn't stand that; I couldn't stand even hearing him laughingly accused of it, though in my innermost heart I didn't believe it true; but he was kind and polite in his devotional way to a pretty friend of mine, and she assumed little airs of believing that she had but to hold up her hand to win him entirely. She told me little lies, that were half truths, in fact, and I could not bear them at last; so, hard as it was to stay in a home where I was not wanted, I gave my lover up."

"And he married that woman who was here to-day! Since he could do that, don't grieve for him, Nina," Mrs. Eldon said, rising up. "Frank has never told me a word of all this—doesn't he know it?"

"Oh yes; he knows some of it," Nina said; and Mrs. Eldon, sweet and clever and bright as she was, felt sorry that her husband had kept a secret concerning their fair young guest—*his* former friend—from her.

For the friendship between Mrs. Eldon and Miss Delany only dated from the marriage of the first-named with Sir Arthur Delany's former ward, the present vicar of Arleigh. And there were moments when it occurred to the beautiful, petted young wife that Nina might have been Mrs. Eldon "an she had willed it" so. Not that she had ever experienced a qualm proper of jealousy. The fixed idea of her own fascinations was too firmly rooted in her mind for that. But she did feel that there was a great touch of generosity in her conduct toward Miss Delany. Sir Arthur Delany had lately married a pretty girl, some two or three years younger than his daughter, which circumstance rendered Nina's home life a very unpleasant one. She had no relations whom she liked well enough to reside in their houses, except occasionally as a favor to them. She had engaged in a verbal warfare with her step-mother, and had been unfortunate enough to come off conqueror from the contest, which success rendered her residence in her father's house for some time an impossibility. Her own resolve had been heroic but impractical. "I shall go out

as a governess or a companion for a few months," she had said to Frank Eldon during the last private interview they had before his marriage. And then, on behalf of his future wife, Frank Eldon had given Nina a very warm invitation to the Ardleigh Vicarage. On the whole, there was some excuse for the lovely bride feeling rather aggrieved that she had not had a fuller confidence reposed in her.

The morning after that disclosure had been made to Mr. Barrington by his wife concerning the vicinity of *a* Miss Delany, who might be *the* Miss Delany, the master of Ardleigh End was in a very disturbed state of mind. In the naughtiness of his heart he was now longing to see this old love of his quite as heartily as he had dreaded doing so on the first blush of the possibility. If only he could see her, unhampered by the presence of his wife, unfettered by the fear that at any moment Mrs. Barrington might commit some solecism which would strike Nina's sense of the absurd, and cause that old well-remembered smile, in which lurked the suspicion of a sneer, to flit over her face. But difficulties arose in opposition to his wishes which he had not foreseen. Mrs. Barrington, after a night's reflection on the subject, was as urgent for him to go to London at once, and to take her, as the day before she had been unwilling that he should do either.

"I find, after all, that my business can be deferred," he said, when she mooted the plan at breakfast.

"You have had no letters from London this morning, Gerald, for I opened the bag myself," she replied, with the quickly-roused suspicion that she was being imposed upon, which is the private curse of some women.

"I didn't require a letter from London to convince me that I needn't go just yet," he said. "At any rate, I am not going."

And then Mrs. Barrington set her wits to work to discover why he had changed his mind.

The mistress of Ardleigh End was not impeded in this goodly work of finding out something her husband desired to conceal from her by any occupations or duties. She had literally neither of these things. The greatest domestic efforts were those she made when ordering dinner and buying furniture. Such mind as nature had originally given her at her birth was within her still, it is to be supposed; but it was never made apparent, not having further cultivation than that bestowed upon it by a garrison-town boarding-school, which was immortalized in the annals of the neighborhood as the arena in which the loves of divers ensigns had played havoc. She never thought, she never read, she never wrote any thing besides notes of invitation and acceptance. A brainless, soulless, mindless woman, of whom it was not demanded that she should either toil or spin, she was perhaps no greater pest to others than she was to herself—a dispensation of Providence which is not unfrequent in such cases.

Perhaps the truth that she was all these things had never been borne in with more cruel weight upon her husband's heart than it was on this morning. He was out of heart, thrown out of gear by the abrupt tiding up of old memories, and by the contemplation of painful realities in the present. He was disgusted with himself and all his belongings; anxious to verify Miss Delany, and yet dreading to do so; glad as a man that she had not buried the old love and married another, and yet sorry as a man too that she should still be a waif and stray at the mercy of her very cool-hearted papa, Sir Arthur Delany. Thinking of all these things, he idled away his whole morning in excitedly and feverishly rambling about in a wood that was on a hill-side which commanded a view of the model Vicarage and its garden—a spot which he ceased from his rambling every now and then to watch, with a keen interest, that seemed almost criminal to himself.

After a time he saw two ladies moving about in the garden—two ladies in bright-colored summer dresses. Of course they were the figures of Mrs. Eldon and her guest; but at that distance he found it impossible to identify Nina for a little time. They appeared to be of equal height. "The violet dress has her figure, but the straw-colored one walks more like her," he said to himself; and then he made up his mind that the straw-colored was Nina, and so watched all its evolutions with profoundest interest.

At length he saw her take off her hat as if she were weary of its weight, press her hands to her forehead, and go away into the house. Then the violet-robed lady turned away through an open path that would lead out into the meadow at the bottom of the hill-side wood; and Mr. Barrington resolved to go down and have a casual meeting and a passing glance at the lovely Mrs. Eldon.

He came out from the wood into the meadow when the lady was half across the latter, evidently on her way to the wood. He had advanced too far to turn back when he discovered that the evolutions he had been watching with absorbed interest were not the evolutions of Miss Delany. He was face to face with Nina before he could make up his mind as to what it behooved him to do.

All in a moment he saw that the four years which had passed over her head since they had parted had ripened her beauty, enriched and mellowed her charms. In the same moment he saw that she had herself perfectly under control, that she was not going to be constrained, agitated, or embarrassed, and above all he saw that she meant to speak to him.

Her hand was stretched out, and as he took it it felt so strong, so capable, and yet so tender and so gentle, that he cursed his fate afresh in having lost it.

"What a lovely part of the world we meet in, Mr. Barrington!" she said, with that old, dear, soft stress on the "a" that had made him

adore the Irish accent. "I was prepared to meet you," she added, "for I heard you were living here from your—from Mrs. Barrington yesterday."

"And I heard of you. Still, I was hardly prepared to meet you," he said, with a shade of hesitation. He loved her so dearly at that moment, though she had turned him off to ruin without sufficient cause, that his voice was not under proper control. It had been for such a little thing! She had been such a darling to his heart! Every thing had promised so fairly for the wealthy lover and the well-born love, that it was no wonder there was a sob in his voice as in the sadness of his heart he compared the present with the past.

"And how are you spending your time!" she asked, disregarding womanfully the sound she heard. "Are you devoting yourself to experimental agriculture, or to sport, or to the cultivation of cabbages, or to horticultural pursuits, that you are settled down so quietly here?" she asked.

"I am not devoted to any thing or to any body," he said, in a low voice; and then for the first time a shade of color came up on Miss Delany's face.

"I had never heard of your marriage," the young lady said, remembering, and quickly recovering herself.

"Do you wonder that I never published the fact?" he said, bitterly. And Miss Delany looked him gravely in the face, and said,

"Yes."

"Nina, you have seen my wife."

Again she said, "Yes."

"Yet you say you can wonder at my silence on the subject?"

"You chose her, you know," Miss Delany said, simply. "I think if I were a man I should always and under all circumstances stand out bravely and openly for my choice, whatever it might happen to be."

Almost insensibly during this conversation they had turned and sauntered on toward the wood. They entered it as she uttered the last words, and walked along one of its leafy glades, and bars of gold from the mid-day sun fell down and irradiated their path. It was so sweet, so very sweet in the wood that day. The wood was one that abounded in ferny depths, and there was a full choir of birds upon every bough. Nature smiled, and her smile "filled the silence like a speech" as they sauntered slowly on. Poor things! They were both so very unhappy.

"I must go back," Miss Delany said, arresting her steps suddenly. "I was going to say I must go home. But I have no home now."

"Oh, Nina," he began, "let me tell you before you leave me, and cut off my only chance of telling you, how I came to marry as I did. There will be some comfort to me in that."

"Will there, really?" Mrs. Barrington said, in a shrill voice, standing before them in a sort of full blaze as they turned round.

CHAPTER III.

A DOUBLE DIFFICULTY.

MRS. BARRINGTON was not a pleasant object to confront. She was enraged, and her rage was natural—was only what might be considered justifiable from such a woman under such circumstances. The words which had fallen from her husband's lips and upon her ears were in reality sinless and harmless, provided they were interpreted aright. But they were also capable of being interpreted awrong. Miss Delany felt in an instant that all her pride, and self-possession, and consciousness of rectitude would be called into requisition during the next few minutes.

"I suppose you will allow me to join you in your walk?" she began, panting a little, and smiling, so as to convey the idea of suppressed ferocity in a way no scowling could have done. "I suppose you will allow me to join you in your walk? You will not object to that, though you had arranged it so cleverly and quietly."

"Object to your joining us—planned it quietly! Do you know what you are talking about?" Nina said, quickly, losing her self-possession, and suffering herself to speak with a degree of haughty amazement that only tended to further exasperate Mrs. Barrington. Then all in an instant, before the breathless, angry woman could speak, and render strife unavoidable, Miss Delany recovered herself under the recollection that for a certain distance companionship with these people was inevitable, and that it was impossible for her to brawl.

"If I had known yesterday," she said, in her sweetest, frankest tones, "that the Mr. Barrington you mentioned was a former friend of mine, I would have given him no cause to complain of seeming neglect from me; but I only knew him to be the same when I met him accidentally to-day."

"Oh!" Mrs. Barrington said, rather confusedly, "I thought you knew that. It seemed odd that neither you nor Gerald should have said any thing to me about it; but of course—lor', what a pity you didn't know it yesterday!"

"The woman is abject as well as insolent," Miss Delany thought, scornfully. "How he must hate her!" But, outwardly, she smiled acquiescence in Mrs. Barrington's view of the case as it had stood yesterday; and perhaps, for all her frank integrity, did hope that Mrs. Barrington did not see through her as clearly as she saw through Mrs. Barrington.

It was altogether very ignominious. The man who had delivered himself up to the inferior of these two women felt it to be so as he made a humiliating progress through the open meadow in their company, and longed for that point to be gained where the Vicarage garden ran down and joined the meadow, and where, it was only natural to suppose, Miss Delany would leave them. But Miss Delany disappointed him cruelly. "I may as well walk on to the road with you, and go home through the

gates," she said, carelessly, to Mrs. Barrington, when they reached this longed-for point. And even Mrs. Barrington was struck with the delicacy and the bravery which struggled so hard to avert any further embarrassment.

But the great gates were reached at last, and then (with what inward joyfulness on Nina's part can never be portrayed) they parted. While there was a possibility of her being seen, Miss Delany preserved her unconcerned demeanor; but as soon as that possibility was over—as soon, in fact, as she was well inside the house, that air of unconcern broke down, and she became excited in bearing as she had been in mind during the last hour. She shouted for Gertrude, but no Gertrude answered to her call; and then she rushed into the study, where she found Frank Eldon writing.

"Frank, I have had such a time of it," she commenced, going up to the table and resting her hand upon his arm—"such a time of it; quite by an accident I met with Gerald Barrington just now, and his wife came up in the middle of the interview and seemed to think it was prearranged, and I had to diplomatize in order to avoid a vulgar row; fancy *me* stemming the tide of a virago's wrath!"

"Poor Nina! I am sorry the necessity for doing so should have been forced upon you." And then he colored a little, and added, "I am very glad, though, that you have been compelled to meet Barrington and his wife; the perfect cure you have pretended to despair of must be effected at last."

"Indeed no," she said, with a sort of sad simplicity that was infinitely touching. "I can look on him now as a married man, but I can never look upon him as I ought to look upon a married man. She's a horrible woman," the girl went on, energetically; "a volatile, vulgar, horrible woman; and he will have her close to him all his life, debasing him."

She burst out crying as she finished her sentence, and Mr. Eldon was at a loss how it would be well to treat her.

"Where is Gertrude?" he said, anxiously. "I wish you would compose yourself and talk to Gertrude."

"Talking to Gertrude wouldn't compose me," Nina said, impatiently. "Gertrude would tell me truths. Of course she would. Why shouldn't she? They are the right things to tell one. She would tell me he had been unworthy once, and was probably unworthy now. Besides, Gertrude is a wife, and would bid me respect his wife's claims on him."

"You don't mean to say you're regretting him still?" Mr. Eldon said, in a tone of annoyance.

"Regretting him! bitterly—if you are shocked at hearing truths, you must be shocked. Still, bitterly as I regret the having lost him, I regret still more that he should have lost his own self-respect, as he must have done in this marriage. Oh, she's coarse-minded, Frank! Can you wonder that regret should have all its own way with me now?"

"You poor, impetuous girl!" he said, kindly; "you rash foe to yourself!" And as he spoke he took the hand that was lying on the table and pressed it in his own, and while he was thus mutely comforting her Gertrude came sauntering in.

She paused with a heightened color when she saw the attitude of her husband and her guest; but the natural hue and the usual expression came back to her face as Nina said:

"Gertrude, you will despise me very much; I have been with Gerald Barrington and his wife, and I am broken-hearted." And then she told the story of her encounter with them in the wood.

"Frank," Mrs. Eldon said to her husband, when Miss Delany left them after a time, "she's an awful charge; she is capable of eloping with that man, or of doing any thing dreadful. How one is deceived! Up to yesterday I thought her a light-hearted, whole-hearted girl, and now I find that she has been brooding over a love disappointment for years. She must not stay here."

"Where can she go?" he asked.

"She must humble herself a little, and go home," Mrs. Eldon said, decidedly.

"She will never do that—I am sure she will never do that."

"I will not consent to any plan that may endanger the domestic happiness of another woman," Mrs. Eldon said, with her pretty little air of lofty matronhood, "even though that woman is odious and underbred."

"That's exactly the line Nina feared you would take," Frank Eldon said, testily. "Why in the world women will give vent to exalted sentiments, when they are not called for, I can't imagine."

"Nina is very kind to come and express her fears privately to my husband as to the line I may take," Mrs. Eldon said, coldly.

"My dear girl! don't misunderstand me: Nina and I were brought up together as brother and sister. I knew her when she took this fever of love for Gerald Barrington. I saw her in all the stages of her passion and her jealousy and her misery; she has nothing to conceal from me. You can't wonder at her not baring every act of her folly to you, can you?"

"But you might have done so, Frank," the pretty young wife said, caressingly, "at least. No, I *don't* wish you to be mean, and to tell me any thing that she couldn't help your knowing, but that she doesn't wish me to know; for all that, I have a little sympathy for Mrs. Barrington, and so I should not like Nina to stay down here, and cause him to find his wife more odious than ever from the contrast."

"They probably will not meet again."

"You don't believe that yourself; they will meet again surely if she stays here, and then—"

Mrs. Eldon did not say what then; but she nodded her head, and walked out of the room,

leaving her husband with the fervent prayer on his lips and in his heart that women would sometimes dive into motives, and not be swayed about in their judgment so wholly and entirely by manner.

In the mean time Nina was up stairs, feeling bewildered, tired, miserable, and unconscious of whether she was going to do right or wrong. In her hand she held a short note which she had just received from Gerald Barrington.

THE RUNNING TURF IN AMERICA.

[Second Paper.]

THE oldest race-course in the West is that located at Lexington, Kentucky. The present association was chartered in 1828, but racing was carried on there long anterior to this. The great strip of country in Kentucky, where the rich blue grass grows so luxuriantly, for many years has been known as the "race-horse region of America." Racing is one of the pastimes of the people; and the love of racing led to the breeding of the thorough-bred. The colts mature rapidly in the genial climate and on the nutritious grass; and, for nearly half a century, they have asserted their claims to pre-eminence. Kentucky stock is justly famous, and breeding there is attended with less expense than in many other sections, for the reason that the colts thrive so well in grazing over the rich pasture lands.

The Lexington Association has been singularly prosperous. Since 1828, up to the present time, it has held two, and sometimes three, meetings every year, excepting in 1862, when only a spring meeting was held, Kirby Smith's army being camped on the course in the fall. This is something that can be said of no other association in America, and speaks to us of the intensity of the racing spirit in that section of Kentucky; for it must be borne in mind that Lexington, like many other cities south of the old Mason and Dixon line, suffered much by the late civil war. Its streets sometimes were patrolled by the Grays, and at other times guarded by the Blues. Still the association maintained its organization; and racing was kept up, no matter what flag floated from the staff. Many of the most celebrated horses that have graced the American turf made their *début* on the Lexington course; and the brilliant leading men of the State, such as Clay and Crittenden and Marshall, have watched the trials of speed from the grand stand, and mingled with their fellow-citizens on the quarter stretch.

For a number of years Kentucky and Tennessee kept up a generous rivalry, a horse owned or bred in one State being selected to run against one owned or bred in the other. But the most memorable races ever witnessed in the commonwealth were those between Wagner and Gray Eagle, decided at Louisville in the autumn of 1839. Wagner, a son of Sir Charles, was a handsome chestnut, with a blaze in his face, standing fifteen and a half hands. As a

four-year-old, in the summer of 1838, he had defeated many competitors, and won proud distinction. Gray Eagle, perhaps, was one of the finest-looking horses that ever charmed the eye. He was sixteen hands high, a beautiful gray, with flowing silver main and tail. He was sired by Woodpecker, and he by Bertrand. He was a game and fleet horse, and the idol of Kentuckians.

On the first of January, 1839, a stake for all ages, four-mile heats, closed with ten subscribers at \$2000 each, half forfeit; and among the entries were the Louisiana horse Wagner, five years old, and the Kentucky horse Gray Eagle, four years old. The race came off Monday, September 30, four only of the nominations starting. During the spring and summer the chances of Wagner and Gray Eagle in this stake had been widely canvassed, and the feeling between the partisans of each horse was most intense. For months, all over the South, the coming struggle was the topic of earnest discussion. And, on the day of the race, a more brilliant assembly was never seen on any course than was gathered on the course at Louisville. The crowd was immense, and the excitement at fever point. In that nodding sea of human forms were the blue-eyed belles from the North, and the brown-eyed queens of beauty from the South; were men distinguished at the bar, on the bench, the press, in the senate, and in the army and navy. Senators Clay and Crittenden and Porter were there, and so were Governor Poindexter, General Atkinson, Judges Rowan and Woolley, and Letcher and Menifee, and Slidell and Kenner. The day was delightful, and the occasion one long to be remembered. As an indication of the strength of the rivalry, it is stated that not a Kentuckian on the ground laid out a dollar on Wagner. Gray Eagle was the champion of the State, and they would not bet against him, even after he had lost the first heat. Wagner was better managed than Gray Eagle, and he won, after a terrible contest, the first and second heats, and the race. The finish is thus eloquently described by the late William T. Porter: "From the Oakland House home it was a terrible race. By the most extraordinary exertions, Wagner got up neck and neck with the gallant gray, as they swung round the turn into the quarter stretch. The feelings of the assembled thousands were wrought up to a pitch absolutely painful. Silence the most profound reigned over that vast assembly as these noble animals sped on as if life and death called forth their utmost energies. Both jockeys had their whip-hands at work, and at every stroke each spur, with a desperate stab, was buried to the rowel-head. Gray Eagle, for the first hundred yards, was clearly gaining; but, in another instant, Wagner was even with him. Both were out and doing their best. It was any body's race yet; now Wagner, now Gray Eagle, has the advantage. It will be a dead-heat! 'See, Gray Eagle's got him!' 'No—Wagner's ahead!'

A moment ensues—the people shout—hearts throb—ladies faint—a thrill of emotion, and the race is over! Wagner wins by a neck in 7.44, the best race ever run south of the Potomac; while Kentucky's gallant champion demonstrates his claim to that proud title by a performance which throws into the shade the most brilliant ever made in his native State."

The friends of Gray Eagle were not satisfied with the result. They were anxious to have the race run over; and, five days after the first battle, the two horses again met in a race of four-mile heats. The crowd again was immense, and the excitement great. Gray Eagle, amidst the wildest applause, won the first heat, Wagner the second, and in the third heat the beautiful gray broke down, thus surrendering the victory to the game chestnut. These contests are remembered with pride by Kentuckians. Ask the silver-haired man to-day of the turf, and, with flashing eyes, he will tell you the story of Wagner and Gray Eagle.

In 1833, at the farm of John Wickham, Esq., near Richmond, Virginia, a colt was foaled who, as the years matured his form, won imperishable fame. He was the son of Timoleon, and the sister to Tuckahoe. His lineage was pure, the richest of blood flowing in his veins. He grew up into a magnificent-looking horse, a beautiful chestnut, with a white strip in his face, and two white stockings behind. He was compact in form, made up of bone and substance, and combining speed with immense power. He was called Boston, named after the popular game of cards, and not for the city of Boston, as many have supposed. The 20th of April, 1836, he made his *début* on the turf at Broad Rock, Virginia—a *début* which was mortifying to his friends, as he bolted and lost the race. But he was not long in wiping out this disgrace. During a long and memorable career on the turf he ran forty-five races, thirty at four miles; and when he retired to the stud, at ten years of age, he was sound as a young horse, his legs absolutely being free from blemish. This is a remarkable fact, for it is upon the legs that severe work most generally tells.

Boston's most famous race was with that wonderful little mare, Fashion, at the Union Course, Long Island, the 10th of May, 1842. It was a race of four-mile heats, for \$20,000 a side. The match was made in the autumn of 1841, and during the winter and early spring it was canvassed on all sides. Fashion, sired by imported Trustee, dam, the celebrated Bonnets o' Blue, was foaled 26th of April, 1837, being bred at Madison, New Jersey, by William Gibbons, Esq. She was a satin-coated chestnut, with a star, and a ring of white above the coronet of the left hind foot. She was 15½ hands high, withers prominent, head and neck light, suggesting lines of grace, faultless legs, and capacious chest. She was built and muscled much like the greyhound, and her speed was marvelous. Her turf career, though brief, had been brilliant, and she was regarded as the

nonpareil of her day. She had defeated Boston in 1841, and the partisans of the stallion were anxious to fight the battle over again. There was a great rush to the Union Course on that bright 10th day of May. It is estimated that there were seventy thousand people on the ground, drawn there by the fame of the two racers. The proudest and most influential in the land occupied positions on the grand stand, and freely mingled in the throng. For more than a quarter of a mile the spectators ranged on the side of the course and of the field, thus forming a gauntlet through which the horses ran. Senator Barrow, of Louisiana, Hon. John M. Botts, of Virginia, and J. Hamilton Wilkes, Esq., were in the judges' stand. Fashion represented the North, and Boston the South. It was a great race, a contest full of excitement, a battle courageously, fiercely fought, ending in the defeat of Boston. Fashion won the first heat in 7 minutes 32½ seconds, and the second heat in 7 minutes 45 seconds—wonderful time. Though defeated, Boston was not dishonored, since he ran a game race, and carried fifteen pounds more weight than the mare; and it is weight that tells in a four-mile contest. "Though beaten," writes the turf historian of that day, "it is conceded on all hands that Boston has acquired a more vast renown by this wonderful race than by his thirty-five previous victories combined. He is worth more since than he was before the match." And every where in the sporting world this aphorism was quoted: "All that can be said is, that Boston has beaten himself, and Fashion has beaten Boston!"

Boston was no less successful in the stud than on the turf. He made his first season at Spring Grove, Hanover County, Virginia, in 1843; and in the winter of 1846 he was taken to Kentucky and placed under the care of Colonel E. M. Blackburn, in Woodford County. The horse contracted a severe cold on the trip, from which he never fully recovered. He continued to revel in the delights of the harem until the fall of 1849, when he grew feeble and died. A struggle, and the spirit was free, the cords of the limbs unstrung. When Boston died the breeding world suffered an irreparable loss. He won great fame himself; but since the winds have been wailing over his humble grave, his descendants have kept green this fame. He sired a galaxy of racers, the two bright stars of which were Lexington and Lecomte. The turfman judges a horse by his *blood*, his *form*, his *deeds*, and his *produce*; and judging by such, Boston is pronounced the greatest race-horse that America ever produced.

Lexington enjoys world-wide fame. He was bred by Dr. E. Warfield, near Lexington, Kentucky, and was foaled March 17, 1850. He was got by Boston, and his dam was Alice Carneal, by imported Sarpedon. He commenced his turf career at Lexington, under the name of Darley, May 23, 1853, being then three years old. He met the most promising

colts of Kentucky, and distinguished himself by winning the race in two straight heats. May 28 he was purchased by Mr. Ten Broeck for \$2500, who changed his name from Darley to Lexington. At New Orleans, April 1, 1854, twenty thousand people assembled on the Metairie Course to witness the great struggle for superiority in the Post stake, four-mile heats, for all ages. The subscription to the stake was \$5000, Louisiana, Alabama, Kentucky, and Mississippi becoming the subscribers. Each State had the privilege of naming a horse to contend for her honor in the race. Kentucky named Lexington, Mississippi Lecomte, Alabama Highlander, and Louisiana Arrow. Among the distinguished gentlemen in the judges' stand was ex-President Fillmore. The course was heavy from previous rains, and the strong wind which prevailed had so hardened the mud as to make it stiff and unyielding.

The chief contest was between Lexington and his half-brother Lecomte, the former winning the race in two straight heats. The victory was a brilliant one, especially when we remember that accident alone led to the training of the white-legged son of Boston. He was not regarded as a promising colt, and his dam was unknown to fame. In fact, the purity of her blood was questioned. His success in the great Post-stake race placed his star in the ascendant. The swift-footed Lecomte had been beaten; but the friends of that horse were not satisfied with the result. They were eager to fight the battle over again. On the 8th of April the two horses came together for the second time. Lexington was out of condition, was badly ridden, and was defeated, Lecomte in this race making the then fastest time at four miles on record in the United States. He finished the first heat in 7 minutes 26 seconds, and the second in 7 minutes 38½ seconds.

The rivalry between the half-brothers was now greater than ever. Each had his partisans, and each was claimed the superior of the other. Mr. Ten Broeck, whose subsequent career in Europe attracted so much attention, determined to settle the question by a bold adventure. He issued a plucky challenge, proposing to run Lexington over the Metairie Course, a single four miles, against the fastest time, at that distance, on record, for the sum of \$20,000; or to run him against any named horse a race of four-mile heats. The publication of this challenge led to a long, and somewhat bitter, newspaper controversy between Colonel Wells and Mr. Ten Broeck; but the wordy letters failed to bring about a decisive race between Lexington and Lecomte. The proposition, however, to run Lexington against time was accepted by Colonel Calvin Green and Captain John Belcher, of Virginia, their acceptance being published June 17, 1854. The race was run over the Metairie Course, New Orleans, on Monday, April 2, 1855. The track had previously been carefully measured and found to be a full mile; therefore there could be no quibble in regard to

distance. The day was the loveliest of the season, the track in superb order, and the course of people immense. Lexington was ridden by the able jockey, Gilbert W. Patrick, whose name has been abridged to Gilpatrick. The excitement attending the progress of the race was very great. Briefly yet clearly is the running described: "Gilpatrick, upon Lexington, now prepared for action; and as he started up the stretch, on his proud courser, to do that which no other horse had ever attempted, the man and horse formed a beautiful and perfect picture. He turned him round just below the draw-gates, and as he reached the judges' stand, where the drum tapped, he was at a pace it was intended he should run. To our mind he was run too fast the first mile, which was accomplished in 1.47½; the first half in 0.53. Upon reaching the stand it was intimated to him to go slower, which he did. Joe Blackburn was started behind him at the beginning of the first mile, but the respectful distance he kept in his rear must certainly have done him an injury rather than a benefit, for at no time was he near enough for Lexington to hear the sound of his hoofs. The pace in the second mile visibly decreased; Arrow, who was started before its commencement, waiting about thirty yards behind Lexington. In the third mile Arrow closed the gap, and Lexington, fearing him, was a little more anxious, and slightly increased his pace. Upon entering the fourth mile Arrow was stopped, and Joe Blackburn went at him again, but, as in the first instance, he was 'like chips in porridge'—of no benefit. Lexington darted off in earnest, running the last mile in 1.48½. He reached the head of the front stretch in 6.55, running its entire length in 24½ seconds; the whole time of the four miles in 7.19½, carrying 103 pounds, Gilpatrick being three pounds overweight." This was a wonderful performance—a something that no horse had ever done before, and a feat that no horse has been able to equal since. The world now rang with applause for Lexington. And yet, great as his triumph was, it is claimed by observing turfmen who witnessed the race that, had it been necessary, the four miles could have been finished on that day in at least 7 minutes and 10 seconds.

Though the accredited hero of the fastest four-mile time on record, Lexington was called upon, April 14, to meet once more his old rival, Lecomte. The race attracted much attention, and it ended in the defeat of Lecomte. This concluded Lexington's career on the turf. It was short, but unsurpassed in brilliance. He started seven times in all, and won six races, his total winnings amounting to \$56,000. His triumphs in the stud, in addition to his triumphs on the turf, stamp him as the greatest of living horses. In 1856, the late R. A. Alexander, well known as the largest breeder in the world, while in England, purchased Lexington of Mr. Ten Broeck for \$15,000. On Mr. Alexander's return to the United States the stallion

was removed to Woodburn Farm, in Woodford County, Kentucky, where he has remained ever since, with the exception of a temporary visit to Illinois in 1865. Shortly after his withdrawal from the turf he went blind, in consequence of filling himself at the corn-bin, just before a severe trial race. For neither man nor horse can perform great physical feats, without injury to himself, with a stomach overburdened with food. Lexington is a blood bay, with fore and hind feet and pasterns, and a small portion of his hind-legs above the pastern joints, white. He also has a white nose. As the incomparable trotter, Dexter, is similarly marked, we may safely infer that there is not much truth in the old nursery jingle:

"Four white feet
And a white nose,
Throw him to the crows."

Lexington stands 15 hands 3 inches high; his back is of medium length, and his loin wide, slightly curved, and very powerful. His body is well ribbed, and his limbs strong and well proportioned. We are thus particular in the description of him, for he has proved the greatest of modern sires; for the past six years the fields on our principal race-courses have largely been made up of the get of Lexington. In one year alone he sired the great triumvirate—Norfolk, Asteroid, and Kentucky. Fifty thousand dollars were refused for Asteroid, Kentucky sold for \$40,000, and Norfolk, in his racing prime, could not be bought for less than the latter amount. Lexington's great fame and his infirmity have thrown a sad romance around his life. One of the best portraits of him was painted by Scott, representing him led by black Jarret, his groom. The head is turned outward, and we have a full view of the dull, sightless eyes. The right fore-foot is thrown out haltingly, as if feeling for clear and firm ground upon which to place it. The whole form of the horse speaks blindness, and one can not gaze upon the picture, and recall the brilliant triumphs of the past, without a shade of sadness stealing over the face.

The foundation for the improvement of the blood-horse in Tennessee was laid by Barry's Gray Medley, a horse of beauty, spirit, and gameness, who made his first season ten miles north of Nashville, in the year 1800. He was got by imported Medley, and was the sire of the dam of the famous brood-mare, Madam Tonson. Barry's Medley was bred in Virginia, and ridden from that State to Tennessee by a colored boy, Altamont, raised by General Washington; this faithful black was then the servant of Redman D. Barry, and for a year after leaving Virginia with Medley, his master heard nothing of him. He presumed that slave and horse were lost to him forever; and, therefore, at the end of twelve months, was surprised by the report that came to him from the banks of the Cumberland. Altamont had made a successful season with the stallion, and, as the profits of the season, placed \$2000 to the bank

credit of his master. This son of Africa afterward trained Polly Medley, and run her, for Mr. Barry, against Indian Queen, owned and run by General Jackson. The race was contested in 1803, and it resulted in the defeat of Old Hickory, who, in gracefully acknowledging defeat—a thing he was not wont to do—paid a high compliment to Altamont. Mr. Barry was a generous master, and he was so well pleased with the conduct of Altamont that he gave him his freedom in the shape of a pass for ninety-nine years.

After Medley came Wilkes's Wonder, a son of Diomed, then Pacelot and Tennessee Oscar, to build up the blood stock of Tennessee; and this rich infusion of blood aided in making the State one of the race-horse regions of America. Truxton, got by Diomed, large, muscular, and a powerful strider, in early days was the favorite race-horse and stallion of General Andrew Jackson. He was good at any distance, winning from a quarter to a race of four-mile heats. Mr. Catton was the owner of a very fleet mare, Greyhound; and this mare was matched against Truxton, a mile dash. Each racer had its friends, and betting on the result was quite lively. Truxton won the race, and droves of horses—the spoils of victory—were turned over to General Jackson and his party. The memorable duel between Jackson and Dickinson grew out of the defeat of Irving's Plowboy, in a race of two-mile heats, for \$5000, by Truxton. Among the old and prominent breeders of Tennessee may be named Judge Barry, General W. G. Harding, Hon. Bailie Peyton, the Cockerills, and General Lucius J. Polk; the latter the elder brother of General Leonidas Polk, who was killed in the Confederate service.

Almost every turfman is familiar with the name of Colonel E. M. Blackburn. He was a remarkable man, somewhat eccentric, but pleasant in manner notwithstanding. He was one of the first children born in Woodford County, Kentucky; and for more than fifty years was conspicuous on the turf. At different times he had in his possession such renowned horses as Whip, Kosciusko, Goode's Arab, Lance, Shark, American Eclipse, and Gray Eagle. He was eloquent in praise of his horses, each, of course, being the "best" in the country. Though a plain farmer, statesmen and polished gentlemen frequently enjoyed the hospitality of his roof. It was in 1836, at his own house, that he offered the delicate complimentary toast to the pleasant banter of Henry Clay. Blackburn had nearly exhausted the vocabulary in sounding the praises of various horses under his charge, and when the great competitor of the Southern horse Henry came into his hands, Mr. Clay thought to embarrass him by asking him what he could say *new* of American Eclipse. The table was surrounded by convivial souls, and all eyes were turned upon the farmer. He bowed his head, as if in painful silence, while the glasses were being filled; then proudly rising to his feet, with a triumphant smile on his face, and as the wine bubbled in the crystal

goblet in his hand, he said: "Eclipse among horses as Henry Clay among men!" The words were electrical. "Harry of the West" bent his eyes upon the table in confusion, the scarlet mounted to his face, while the guests cheered and drained their glasses. Colonel Blackburn died the 17th of March, 1867, at a greatly advanced age.

Hon. John Minor Botts was one of the most distinguished of Virginia turfmen and breeders. He gave much study to the horse, bred on a large scale, and forgot questions of State to participate in the excitements of the race-course. Though courteous, he was positive in speech, and did not like to be contradicted or corrected. He was wrapped up in the horses bred by himself, fondly believing they had no superiors. Colonel M'Daniels, also a prominent Virginia turfman, was a warm, personal friend of Mr. Botts. But the friendship existing between them did not prevent them from saying sharp things to each other when their blood was afire. A number of years ago Mr. Botts had a young mare entered in a valuable stake at Petersburg. The mare had distinguished herself in her maiden performance, and she was a great favorite over all others in the race. Colonel M'Daniels had a filly, comparatively unknown, engaged in the same stake. Mr. Botts was so confident of achieving victory that, when his mare was led on the course, just before the start for the first heat, he boastfully exclaimed: "There is a racer for you! It is a pity that there is nothing here to run against her to-day. Why, I would back her to the extent of \$60,000 against any thing on the ground." Some of his friends cautioned him to be more prudent in speech, but he would not listen to them. Colonel M'Daniels bit his lips, but said nothing. The word for the start was given, and Mr. Botts's entry won the first heat, carrying nine pounds overweight, not as a penalty, but simply to gratify the vanity of the owner. He felt confident that she could win and pack the extra weight; and if she did so, the performance would be all the greater. Colonel M'Daniels's filly cooled out well, and when called for the second heat, she was in superb condition. She got a good start, and ran so gamely that she could not be headed. To the great surprise of Mr. Botts she won the heat. He watched the finish in blank amazement; his confidence in his mare was shaken, and he ordered that the extra weight be taken off. Colonel M'Daniels and Mr. Botts, when the horses were being saddled for the third heat, met on the quarter stretch, when the former said, in a jeering tone: "Mr. Botts, you have heard the story of the hawk and the blue jay!" "No; tell it to me, won't you?" "Briefly, then, the hawk set upon the blue jay, and pursued the frightened bird with great swiftness. When almost within the clutch of the deadly talons, the blue jay darted into a brush-heap, where the hawk could not follow. The bird, so badly frightened a moment before, now turned, in its safe retreat, upon the disappoint-

ed hawk with its mocking cry of *c-ter gl-a, c-ter gl-a*. The application is easy, Mr. Botts. You are *too late* in taking the extra weight off your mare." The manner in which this was said, and the circumstances which gave rise to the speech, so exasperated Mr. Botts that he quarreled with his old friend. Colonel M'Daniels won the race; and, after what had passed, Mr. Botts refused to be reconciled to him. Years passed, and the estrangement grew wider. The war swept over Virginia, and there was an end to turf sports. The outspoken Unionism of Mr. Botts was not pleasing to the Confederate government. In 1861 he was arrested, and, for a short time, confined as a political prisoner in Castle Godwin, Richmond. This prison was the property of Colonel M'Daniels, and at its door the two old turfmen met, after an estrangement of years, a tear in each eye, and a clasp of hands that plainly said, "Forgive and forget;" and they remained firm friends until the one crossed to the far, flowery banks of the silent river, to be soon followed by the other.

Revenue, perhaps, was the greatest horse that Mr. Botts ever owned. He was a stallion of singular beauty, symmetrical in form, and proud in his carriage; was successful both on the turf and in the stud. The last two years of Revenue's life were passed at Major Horner's place, Belle Air, near Warrenton, Virginia. He grew very feeble in the early autumn of 1868, and died September 16. For a fortnight before his death he had refused his food, and was so weak that he could scarcely stand. The very day that he died, and but two hours before the last terrible convulsion, the worn and weary old stallion was led out into the bright sunshine. He tried to nip the green grass, but the effort was too great for him. Standing there, stupid and tottering, in the dreamy September air, his eyes wandered to where a mare was grazing in all of her youth, health, and glorious physical beauty. The sight moved the heart of the dying stallion. He gazed in admiration, and there was a thrill of the old passionate fire in the thin blue veins. The picture of beauty charmed him; he proudly straightened himself, the light flashing from his eyes, and looked as if he had renewed his youth. A feeble neigh, and the whirl of passion was gone; the head dropped nerveless, the glassy film again gathered in the eyes, the legs trembled more violently, and, in less than two hours, Revenue had laid himself down and breathed his last. The gallant old racer was buried in a sequestered nook at Belle Air, with all the honors due a horse of his fame.

No horse since the importation of Diomed played a more important part in the turf history of America than Glencoe. He was got by Sultan, his dam Trampoline, by Tramp; and he was bred in England, by Lord Jersey, in 1831. After a successful career on the English turf, he was imported to this country by James Jackson, of Alabama. Glencoe was a beautiful chestnut, a large star in the forehead, and both

hind-legs white half-way up to the hocks. He stood sixteen hands high, and was a horse of great bone and sinew. The greatest of English stallions, Stockwell, the sire of the most successful racers in Great Britain, was out of Pocahontas, a daughter of Glencoe. The infusion of Glencoe blood added to the fame of American racers. His daughters have proved, especially when bred to Lexington, wonderful brood-mares. Lecomte, Starke, Prioress, Brown Dick, Lodi, Fleetwing, Idlewild, and the dazzling trio, Asteroid, Kentucky, and Norfolk, all came from Glencoe mares. At twenty-seven years of age the old chestnut died, at Georgetown, Kentucky; and his owner at the time, A. Keene Richards, Esq., caused him to be buried in his garden, near the spot where his famed daughter Peytona had been laid to rest. Age did not deal kindly with Glencoe. The painting of him just before his death, by Scott, represents a physical wreck—sightless eyes, back deeply swayed, and other plain marks of feeble age.

From Lexington and the daughters of Glencoe descended the three horses, Kentucky, Norfolk, and Asteroid, that made such a great stir in the racing world at the close of our civil war. Kentucky was out of Magnolia, and he was bred at classic Ashland, by John M. Clay, a son of the Great Commoner. Mr. Clay, by-the-way, has been one of the most successful of American breeders. October 6, 1863, Kentucky, then two years old, won his first race at Paterson, New Jersey; and on the 7th of June, 1864, at Paterson, he lost his first race, being defeated for the Derby sweepstakes, one mile and a half dash, by his half-brother and rival, Norfolk, out of Novice. This defeat led to a long and bitter controversy. Norfolk was taken to California by Mr. Winters, where he now remains. Consequently the two horses never again met on the turf to decide the question of superiority. Immediately after winning his first race Kentucky was sold to Mr. John F. Purdy, who transferred him to W. R. Travers, Esq. His turf career was a brilliant one, vanquishing every thing that presumed to cross his path. Ultimately he was sold to Mr. Leonard W. Jerome, for \$40,000, but now is the property of Mr. Belmont. While Kentucky was winning fame in the East, his half-brother, Asteroid, out of Nebula, was achieving renown in the West. The latter was owned by his breeder, R. A. Alexander, Esq., the proprietor of the great breeding estate, Woodburn, and at Louisville he had distinguished himself by meeting and triumphing over Loadstone, running the first mile of the second heat of a two-mile race in the marvelous time of 1 minute 44 seconds. In California Norfolk was winning golden opinions. Lodi disputed the championship of the Pacific coast with him, and the races that they contested excited the admiration of the world. First, Norfolk defeated Lodi, a son of Yorkshire, at the Union Park, Sacramento, September 18, 1865, a race of two-

mile heats. This, however, was but the prelude to a fiercer and more sanguinary battle. At the same place they came together, September 23, in a race of three-mile heats, each confident of victory. The struggle in the first heat was terrible, both horses running with astonishing power, Norfolk passing the winning score with Lodi lapped upon his quarter, in the unprecedented time of 5 minutes 27½ seconds. The second heat also was won by Norfolk, in the fast time of 5 minutes 29½ seconds, Lodi gaining coming down the home stretch, with the right fore-foot spurting blood at every stride. The spirit of the blood-horse is unconquerable. He will proudly struggle on through pain and distress, when less heroic animals would give up the contest. Distance separated the three half-brothers; each won renown on fields widely apart. Each was claimed the superior of the other, and it was the fond dream of enthusiastic turfmen to bring them together in a race for the honors of supremacy. But the dream was never realized. The controversy between the friends of Kentucky and Asteroid, especially, was marked with much feeling, and the names of the two horses were daily in the mouths of thousands. In September, 1866, the people were gratified by the announcement that Asteroid had arrived at Jerome Park, had come from the West to meet Kentucky on the theatre of his triumphs. He was engaged to run in the Inauguration stake at Jerome Park, and Kentucky could not avoid meeting him here. When it was known that Asteroid had left his paddock at Woodburn to journey East, the excitement was intense in turf circles, and the trains brought to New York crowds from all parts of the Union, even from far-off Texas. The coming race was the all-absorbing topic of conversation. Every morning hundreds of visitors went out to Jerome Park to see the horses at work. Asteroid was one of the grandest-looking horses that ever trod the turf, and one had but to see him to learn to admire. Kentucky was also a magnificent-appearing animal, and his friends maintained confidence in his prowess. But one Sunday morning a gloom fell upon all hearts. Lip spoke to lip, and the intelligence rapidly spread that Asteroid had broken down in a trial gallop in the mud—had sprung a tendon, and his career as a racer was abruptly brought to a close. The disappointment was great. Sad faces were seen on all the drives leading to the Park; and, as the story was told, a tear dimmed more than one eye unused to weeping. Asteroid returned to the West to luxuriate in the stud; and the fond dream of seeing him measure strides with Kentucky was at an end. Kentucky was not satisfied with the laurels he had won. He aspired to eclipse the great performance of his sire. He was backed to run against time—four miles in 7 minutes and 20 seconds, carrying 120 pounds. The trial took place Thursday, October 17, 1867, in the presence of twenty thousand people at Jerome Park. The

day was beautiful, one of the softest of gloriously tinted autumn. Kentucky was badly ridden, was out-paced in the first two miles, and he lost the race by eleven and three-quarter seconds. The only time that the people ever saw him show signs of distress on the turf was coming down the home stretch, in the last mile; he was weak, tottering, and his courage failed him. Had he been properly managed, on that lovely October day, we do not think that he could have been successful. The task was too great for him—he was overmatched. He carried too much weight; and every ounce tells upon the speed and endurance of a horse, especially in a struggle of four miles. By weight you can reduce the fleetest and gamest racer in the world to the level of the most common hack. Kentucky is not a stronger horse than Lexington was, and Lexington, when he ran four miles in 7 minutes 19½ seconds, carried but 103 pounds.

The rivalry between Norfolk, Asteroid, and Kentucky, though exciting a little unpleasant feeling between men of different sections, was a good thing for the turf. The war had swept away the racing institutions of the South; the breeding studs were broken up, and the blood-horse bridled and made to do service in the army. When the sounds of strife were heard throughout the land, life currents gushed from ghastly wounds, and homes were desolate, the people had no heart for the pastimes of the turf; racing was abandoned, horses of royal lineage scattered; and, when the war closed, the old jockey clubs were disorganized—bankrupt. The performances of the three great sons of Lexington roused sinking courage, and directed attention to the turf. It was a theatre on which men of all political opinions could meet in social enjoyment; it called the thoughts from the harrowing scenes of the past, and gave a silver lining to the dark cloud which overhung the future. The people were sick of war and the wrangles growing out of it, and they turned to the turf with eagerness. It was the only practical means of reunion at the time. Men who, a few months before, had faced each other on the battle-field, stood side by side on the race-course, enthusiastically applauding the silken-coated thorough-breds. Where the horses ran, there the men from the South and the men from the North met to exchange cordial greetings. The rivalry between Asteroid, Kentucky, and Norfolk added fuel to the flame, and the racing fever grew hotter day after day. The fever spread, and the glory of the turf was revived in the North. Men of capital came to the support of racing, and the management of the parks was made above reproach. Fashion smiled upon each enterprise, and the shame of the past—the disgrace which attended the decline of the Long Island courses—was forgotten. At Paterson, at Secaucus, and at Saratoga, crowds assembled to witness the speed contests; and when Jerome Park was constructed, and the gates thrown open to

the public, Fashion erected her throne on the club-house balcony, and from it sent forth her imperial edicts. As the South prospered anew she began to reorganize her jockey clubs, and to-day the turf is in a flourishing condition. Mobile has her Magnolia Course, New Orleans her Metairie Course, Memphis her Chickasaw Jockey Club, Nashville her Blood-Horse Association, Louisville her Woodlawn Course, Lexington her Association Course, St. Louis her Laclede Jockey Club, Cincinnati her Buckeye Jockey Club, Zanesville her racing park, Chillicothe the same, New York her Jerome Park, and Saratoga her popular course. In addition to these, running meetings, since the war, have been held at Chicago, Narraganset Park, Springfield (Massachusetts), Boston, Columbus, Ohio, and other places. The two New Jersey courses, Paterson and Secaucus, were unable to stand up against the powerful rivalry of Jerome Park, and for two years they have been under a cloud; but a magnificent racing park is in course of construction at Long Branch, which will be thrown open to the public in the summer of 1870. At nearly all of the well-established courses two meetings, spring and fall, are held every year; and, owing to a diversity of climate, they are so arranged as not to conflict with each other, in addition to making the turf games as regular and eternal as the roll of the seasons. When the parks are deserted in the North, the courses in the South ring with the clatter of hoofs. The members of each club or association are drawn from the wealthiest and most influential ranks of society. The American Jockey Club is the wealthiest of all the clubs. Such prominent gentlemen and capitalists as Messrs. Belmont, Sanford, Duncan, Jerome, and Morris, are leading controllers of racing at Jerome Park.

Racing is the most expensive amusement in the world. To keep up a first-class stable of runners requires a vast outlay of money—from \$50,000 to \$100,000 a year. The owners of race-horses generally are men of fortune, who go upon the turf for pleasure, not profit. It is a royal sport, beyond the reach of modest incomes; and, as wealth is inclined to be ambitious and arrogant, racing is adopted as a pastime by those who have riches and leisure, and who aspire to lead where the vulgar crowd can not follow. It has received the patronage of kings and the support of the nobility in Europe, and neither its origin nor its history is humble. This is the pride and boast of turfmen. It is well that racing is an expensive luxury, for its being so renders it all the more attractive to men of fortune. They make it their amusement, spend money lavishly, and, through trials of speed and a spirit of emulation, direct thought to the problem of breeding, and encourage the improvement of the horse.

To breed successfully, one must understand the principles of blood. The horse is judged by pedigree, speed, endurance, and form. A single obscure cross is a taint in lineage that

the well-advised turfman can not overlook. The blood that flows in the animal's veins must be as pure as the water that gushes from the crystal spring. An uncontaminated pedigree for five generations makes the horse thoroughbred. It is the great study to keep the blood pure, and to so combine the crosses as to blend the highest rate of speed with the greatest endurance and the most graceful form. The largest and most successful breeder in the world was the late Robert Aitcheson Alexander. He was born in Kentucky, was educated at Cambridge, England, under the direction of his uncle, Sir William Alexander; and, on his return to this country, he gave his attention to breeding. He was possessed of large fortune, and was able to carry out his ideas on a grand scale. He made his Kentucky farm, Woodburn, the largest breeding estate in the world, not even excepting that wealthy corporation, the Rawcliffe Stud Company of England. In 1856 his colors, blue and white, first appeared upon the turf. He was unsuccessful for a time, but perseverance secured to him the most formidable racing stud in America. He established annual sales, in which his yearling colts were sold at auction. These sales at Woodburn farm were, and still are, popular. At one of them, in the bright month of June, you meet gentlemen from all parts of the United States and Canada. R. A. Alexander never married; the thorough-bred claimed his warmest love. Still, though modest and unassuming, he was polished in society. He died December 1, 1867, aged forty-eight years, simply of prostration. He never was strong, and the cares of his great breeding estate told upon the worn machinery. The fuel burned out, the motive-power was exhausted, and then there was a tremble of the feebly revolving wheel, followed by a silent clog. Mr. Alexander did more in his short life for the improvement of the blood-horse than any other man in America. Woodburn is still a vast breeding estate, carried on by A. John Alexander, the successor of his brother, and, like him, a bachelor.

Of the men of fortune who recently have established breeding farms, we may mention August Belmont, Esq., Mr. M. H. Sanford, the most liberal of American turfmen, and R. W. Cameron. Lewis G. Morris, Esq., is one of the oldest of Eastern breeders. Kentucky at this time takes the lead as the "blood-horse region" of America, although the breeding of thorough-breds, to greater or less extent, is carried on in Maryland, Virginia, the Carolinas, Alabama, Mississippi, Louisiana, Texas, California, Tennessee, Missouri, Kansas, Illinois, Iowa, Wisconsin, Ohio, New York, Pennsylvania, and New Jersey. The war opened the eyes of the people to the superior qualities of the blood-horse, especially his powers of endurance. The Confederate cavalry was most often successful because it was better mounted than the Federal, the Northern States, as a mass, having given but little attention to the breeding of thorough-

breeds. As the Federal army penetrated the Southern States, horses of unquestioned pedigree fell into the hands of the officers; and when Lee surrendered to Grant, a great many of the purest bred stallions in the country, heretofore the exclusive property of the South, were disseminating their blood throughout the North. While the war broke up many select breeding studs, it scattered noble sires and aristocratic dams in such a manner as to lead to the general improvement of the horse in America.

Time is regarded as a test of merit; but it is not infallible, since atmosphere alone has a marked effect upon the flight of a horse; and atmosphere is not always the same. The changing elasticity of tracks also influences time. A horse capable of making fast time may run in fields where he is not forced to put forth his greatest effort, and he may score victory after victory without astonishing the world with a performance that renders necessary the revision of the time record. When some horses are forced to their mettle they surprise us by the rapidity of their flight, and play havoc with the seconds. It is safe, however, to assert that none but a good horse can go so fast as to claim special mention. Therefore a table of the fastest time is not without interest, or even value:

Three-quarters of a mile, in 1 minute 17½ seconds, by Narraganset, at Narraganset Park, August 25, 1868.

One mile, in 1 minute 44 seconds, by Legal Tender, at Buckeye Course, Cincinnati, June 23, 1865; track thirty feet short of a mile, and horse carried 18 pounds less than his proper weight; track has since been lengthened to a full mile.

One mile, in 1 minute 44¼ seconds, by Revolver, second heat, at Buckeye Course, May 30, 1866.

One mile, in 1 minute 44¼ seconds, by Mammona, first heat, at Lexington, Kentucky, 1862.

One mile, in 1 minute 43½ seconds, by Herzog, three years old, at Buckeye Course, May 25, 1869. Herzog's time, up to this date, is the best on record, since he carried the proper weight, and ran two heats same race—1 minute 45 seconds; 1 minute 43½ seconds.

One mile, in 1 minute 43¾ seconds, by Versailles, Herzog's half-brother, three years old, at Buckeye Course, September 21, 1869. Full weight up.

One mile, in 1 minute 44½ seconds, by Pompey Payne, Herzog's half-brother, three years old, at Lexington, Kentucky, second heat, carrying 90 pounds, May 17, 1869.

One mile, in 1 minute 45½ seconds, by General Duke, two years old, full weight, Buckeye Course, September 26, 1867.

One mile, in 1 minute 45 seconds, by Hamburg, two years old, proper weight, at Buckeye Course, September 23, 1869.

One mile, in 1 minute 48¾ seconds, by Climax, aged nine years, carrying 148¾ pounds, a crushing weight, at Jerome Park, July, 1868.

One mile and a quarter, in 2 minutes 10 seconds, by Narraganset, at Saratoga, August 4, 1869.

Two miles, in 3 minutes 34¼ seconds, by Hegira, catch weight, at Metairie Course, New Orleans, November 23, 1850.

Two miles, in 3 minutes 35¼ seconds; 3 minutes 38¾ seconds, by Lancaster, proper weight, at Lexington, Kentucky, September 12, 1867.

Two miles, in 3 minutes 36¼ seconds; 3 minutes 38 seconds, by Asteroid, at Woodlawn Course, Louisville, Kentucky, June 6, 1865. The first mile of the second heat was run in 1 minute 44 seconds.

Two and a quarter miles, in 4 minutes 1½ seconds, by Kentucky, at Saratoga, August, 1865.

Two and a half miles, in 4 minutes $37\frac{3}{4}$ seconds, by General Yorke, at Narraganset Park, August 26, 1868.

Three miles, in 5 minutes $27\frac{1}{2}$ seconds; 5 minutes $29\frac{1}{2}$ seconds, by Norfolk, at Sacramento, California, September 23, 1865.

Four miles, in 7 minutes $26\frac{1}{4}$ seconds, by Idlewild, full weight, on Long Island, June 25, 1863.

Four miles, in 7 minutes $19\frac{3}{4}$ seconds, by Lexington, five years old, carrying 103 pounds, at Metairie Course, New Orleans, April 2, 1855. Lexington also ran in 7 minutes $23\frac{3}{4}$ seconds, at New Orleans, April 14, 1855, defeating Lecomte.

By the above table we see that Herzog's one mile in 1 minute $43\frac{1}{2}$ seconds is the best mile performance on record, since the track was the proper length, and he carried the full weight allotted to three-year-olds. It is claimed that the French horse, Gladiateur, the hero of the triple event of the English turf, in 1865, ran a mile, at Newmarket Course, in 1 minute 38 seconds; but as in England time is not accepted as a test, and is not officially taken, the record is questioned. Saunterer, it is also asserted, ran a mile in England in 1 minute $40\frac{3}{4}$ seconds. Be this as it may, it is our opinion that neither Gladiateur nor Saunterer, in best form, could have finished a mile quicker at Cincinnati than Herzog did on the 25th of May, 1869. This most promising three-year-old, we regret to write, has died since he placed 1.43 $\frac{1}{2}$ on the time record.

The genius of Troye has preserved to us the forms of nearly all the prominent racers since the memorable struggle of Henry and Eclipse. His name is linked with the stirring events of half a century ago. His portraits grace the walls of cultivated homes in all parts of the New World, and are found in many of the galleries of the Old. Mr. Troye, though advanced in years, is still alive, and devoted to art. He is emphatically the Landseer of America. His face and figure are striking. Tall, well-proportioned, and no stoop in his shoulders, notwithstanding he verges on fourscore years. He wears his hair long, and it falls in gray masses down his back. He is eccentric, both in dress and manner, and has a contempt for that portion of mankind having no sympathy with aristocratic institutions. The wealthiest and most cultivated men of the last decade were his warm personal friends; and, if you talk with him long, he is very apt to remind you of the fact. His speech is affected, inclining to a drawl. Those who know him well admire his genius, while smiling at his eccentricities; and they often ask themselves why the gifted should be peculiar. When Kentucky was prominently on the turf, Troye painted the horse in three different positions. These portraits were much admired; and one day a well-known turfman, for whom the artist had no particular liking, met Mr. T. in a railroad car. He spoke enthusiastically of the paintings, and then endeavored to draw the old man into a conversation. Troye listened with an expression of annoyance on his face, then abruptly asked: "Mr. —, if I mistake not, you are well versed in the art of training horses?" The truth was modestly admitted, and the artist

was forced to listen to a glowing eulogy of a famous horse owned by the turfman. In a few minutes Troye cut short the stream of eloquence by coolly glancing over the morning paper that he had recommenced reading, and speaking in his most affected drawl: "Re-ally, vary fine! Do you know, Sir, that you have a wre-markable appreciation of the fine arts; that is, wre-markable for one who was brought up in a stable?" The conversation abruptly ended here, and from that day to this Troye has had one more enemy in the world.

The inauguration of Jerome Park gave brilliance to the new era of the turf. This course, fitted up with all the elegance that wealth could devise, was made a very attractive spot. The police kept the rough element in check, and fashion flaunted her skirts in the bright, cheery sunshine. And now there is no place on the American continent where such regal display is seen as on a race day at Jerome Park. The belles of New York, apparently, are never so happy as when promenading the Club-house balconies, or flirting on the Grand Stand. They dress for a race with the same elaborate care that they dress for an opera. The drive from New York to the Park is a lovely one; and, when the colors of the American Jockey Club float in the breeze, it is crowded with the most stylish equipages—carriages, tandems, and four-in-hands. We remember seeing on the Grand Stand at Jerome Park, at one time, General Grant, Admiral Farragut, and Madame Ristori. To join in the promenade on the greensward in front of the stands, look up at the crowd, dazzling in dress and beauty, listen to the strains of music that come surging over the little valley from the Club-house hill, and to gaze upon the thorough-breds on the quarter stretch, aglow with excitement and mounted by the gayly-dressed jockeys, is to feel a grand thrill in the veins, to dream of enchanted land. The picture is a beautiful one; for we have the poetry of sound, the poetry of form, and the poetry of motion blended into one harmonious whole. The fame of the meetings at Jerome Park spread over the country, stimulating the organization of new jockey clubs, and leading to the revival of the old clubs.

At Saratoga the race days are almost as brilliant as at the aristocratic Park located in the beautiful suburbs of New York city. The prodigals who wander to the Springs during the summer solstice regard race week as an important event in the flow of their fashionable lives.

Those who follow the turf as a profession have a good deal of hard work to perform—a work colored here and there, however, by the rosy hues of romance. To be a trainer of horses one must have a knowledge of physiology and medicine, and he must be a close observer and a clear reasoner. The horse is difficult to understand, and to prepare him for a severe race is a delicate operation. Too much work is debilitating, and too little fails to clear the veins and lungs, and to strengthen the mus-

cles. A successful trainer must graduate in the rough school of experience. The stable-boys—employed as riders, rubbers, etc.—are generally drawn from the humblest ranks of life. They most frequently are orphans, street Arabs in our great cities, who are fascinated by the glitter of the turf; and, when connected with a racing stable, they lead a nomadic life. The stable travels from park to park—roaming from the Atlantic to beyond the Mississippi, and from the great chain of lakes to the Gulf of Mexico; and the boys, as a part of the stable, have no settled home. They grow up among the horses, sleep with them, and bestow upon them the pure affection of the heart. The defeat of their favorite depresses them, brings tears into their eyes; while victory makes each face radiant with joy. During the running of a race they may hear the murmurs of the crowd, but they do not see the brilliant throng; they have eyes alone for the horse that carries the colors of their stable in the contest. It is a rough school in which to live; but rude contact with the cold, practical world sharpens the wits, develops the keen faculties of the brain; and almost invariably you find, in weighing the jockey, an old head on young shoulders. Some of the boys grow up into prosperous men; but most of them remain true to their early instincts, and rush through the world indifferent to the smiles or frowns of fortune.

The turf is what General B. F. Butler would call a law unto itself. Its rules are carefully drawn, and provision is made for almost every possible contingency. The racing code is broad and technical and it is more closely observed, and more ably expounded, than is the civil code in many sections of our country. In the Western and Southern States they have a turf congress, in which each association is represented; and this congress frames and adopts rules for the government of all the associations included within the congressional district. The Eastern associations, thus far, have not organized a congress; but there is an understanding between them which gives general scope to the law and preserves harmonious action. For instance, an offense against one association is regarded an offense against all; and if a trainer, jockey, or horse is placed under ban by one association, he is denied the privileges of the other courses until the association that inflicted the penalty grants him full pardon. The law is strict, and being general in character, but few who follow racing as a profession care to openly violate it. The law is definite, and so long as it is rigidly, impartially administered, the turf will remain pure. But neglect to enforce it, and disgrace and ruin are sure to follow. Unfortunately, it will not do to be tolerant to those who make a racing code an imperative necessity. They are naturally inclined to break beyond all restraining influences, and they have a confused idea of the true meaning of forbearance. The temptations to override the law are many; the tempter is strong, while the tempted are weak, and,

therefore, we generally find that shame is the fruit of tolerance. The best interests of the turf demand that those who are appointed to interpret and enforce the law at every meeting shall be firm and just. We do not want justice tempered with mercy, but justice in its naked, stony, heroic form. This is an absolute necessity now, for the reason that the turf has been invaded by men who are devoid of a nice sense of honor. They have purchased stables, not to race for pleasure, but to make their horses a means of speculation. Such men may be excluded from membership in the jockey clubs, but the privilege of entering and running their horses under the law can not well be denied them. When they nominate a horse for an event they pledge themselves to abide by the law; and unless the law is carefully guarded, speculation is nothing more or less than downright robbery. Men of this character aided in breaking up the old jockey clubs, and in making the turf a by-word in the North. Charity folded them under her wing, and then the glory of Long Island departed. Surely the present should profit by the story of the past. It is plain to those who have studied recent events that danger again threatens the turf, and prompt action is required to avert the danger. Frail humanity always has manifested a strong disposition to speculate. We can not keep down speculation, but we can throw restraining influences around it, and prevent it from running to crazy extremes. The racing code encourages speculation by legalizing betting. And for what? It is safe to say, to gratify the depraved appetites of about one hundred and fifty men of questionable character. Watch at Saratoga, or Jerome Park, where you please, the crowd that gathers around the pool stand. Meeting after meeting the faces are the same. Those who bid in the pools are professional gamblers. A gentleman of respectable business connections does not like to be seen in that wrangling crowd. If he wants to back a horse, he quietly lays the wager with one or more of his friends, or he sends an agent to operate for him around the pool stand. Who was it that excited the storm of passion in front of the judges' stand at Saratoga, at the close of the Vauxhall-Bayonet race last summer? Certainly not those gentlemen whose names are respected on Change, are honored in literary, scientific, or commercial circles. These men went to the Springs for recreation, for pleasure, and they are not wont to forget themselves, to stoop from the true dignity of a gentleman. They were pleased spectators of the tourney, and had little interest, aside from personal feeling, in the defeat or success of any horse. Who, then, were the brawlers? Who but the professional gamblers that follow from meeting to meeting, and live upon the spoils that they gather! And it is for this handful of professional men that the law legalizes betting. Carefully analyze the question, and soberly weigh it, gentlemen of the jockey clubs, and then tell us if the benefit derived from such

a law is worth more to you than the scandal which grows out of it.

We do not claim that speculation can be abolished from the race-course; but we insist that the deciding of bets should not be made one of the duties of the official judges. Legalizing betting encourages promiscuous gambling; and promiscuous gambling excites passion, and points the way to fraud. The people who fill the grand stands and give refinement to turf gatherings are indifferent to the gains or losses of the betting ring; if they speculate at all, it is among themselves, and on a small scale. They do not make a business of betting, but have just enough at stake to give them keener interest in the running of the horses; and, result as the race may, they part with or accept the trifle at hazard without regarding it in the light of a business transaction. These people give prosperity and glory to the turf. They delight in the games that call forth qualities of speed and endurance; and racing will remain a popular pastime with them until the scandals drive them from the course. The surest way to keep down scandal is to abolish the betting rules, and to firmly enforce the law, no matter who is at fault. Danger threatens to bring the new and brilliant era of the turf to a disgraceful close; but if the jockey clubs are wise the danger will be averted.

PROFESSOR HERON'S MISTAKE.

PROFESSOR HERON used often to go up to talk with Mr. Reed in those days about the alluvial deposits, the latest asteroid, the effects of climate on character, the philosophy of the Greeks, the civilization of the Chinese, the mummied kings of old Egypt. On one such day Gillian came into the room. It is true, the Professor had seen her before—she had been wont to pass before his vision as a ray of light might, without attracting any particular regard; no, I am wrong there, he would have paused to analyze a ray of light; he had never once paused to divine Gillian, though she had been often in the room, bringing the fruit, the pipes, sometimes sitting there at her work. His telescopic glance swept all the fields of air and earth, but had failed to take into account this pretty insect fluttering at his elbow. But to every heart, however deeply interwoven with the operations of science, there comes an instant of individual revelation, when the soul knows itself, comprehends its own unique aims and satisfactions. And so now when his eyes fell upon Gillian they remained fixed there, so to speak. He experienced an uneasy and unfamiliar sensation when their glances met, like the shock of a battery. And did Gillian observe this change? Perhaps so, for a smile, like the sheen of a star, rested upon her face, seemed to radiate from her soul and suffuse her whole being; for a young and lovely woman does not suffer her presence to be ignored for long without taking vengeance at last.

So, suddenly, the Professor began to put forth new traits of character; having studied the heavenly bodies so long, he began to bethink himself of the earthly. He threw aside his shabby garments, he paid attention to the color of his tie, to the polish of his boots, to the complexion of his shirt frills, to the suggestions of his barber.

One day when he rang at Mr. Reed's door, Gillian herself opened it. Her father was not at home; would the Professor come in and wait? Wait with that divinity to attend him? What better thing could he do? Walk out with her, perhaps, into green lanes and blossoming fields.

"Miss Gillian," he faltered, "the day is so fine, it seems a wrong to waste it indoors; will you come out and walk with me?"

"I?" said Gillian; "and with you?"

"Is it too much to ask?" gravely and sadly; "or perhaps you have an engagement?"

"Yes," she answered; "I am housekeeper. I should be glad to go, but you see I am like a child tied to the door-knob."

"But you would be glad to go," he repeated; "that is a most gracious refusal. Then I will stay and help you to keep house, if I may."

They went into the family room together then, where Gillian had been interrupted in watering her plants. "You will excuse me," she asked, "if I attend to these thirsty beings?" as she went about her graceful business. But what would she say next? Evidently he was waiting for her to speak; she could think of nothing worthy of the situation. To talk to the learned Professor about her narcissus, about the last novel she had read, about last Sunday's sermon, seemed simply absurd. What then? The burden of her ignorance was weighing upon her with exceeding heaviness; she resembled a blighted flower that hung its head. There was Orion, to be sure, and the last comet, and—and—oh, how intolerable it would be to spend one's life with a learned professor, and never dare to say one's soul was one's own for fear of running against some profound metaphysical contradiction! And here, in her perplexity, she overturned her favorite ivy. Professor Heron sprung to the rescue in season to save it from destruction. "Ah," said he, "if any thing had happened to it I should not have forgiven you. See, it is like a beautiful thought that wanders whither it will, perpetually inspired with new strength to lift itself nearer heaven!"

"What a blundering sentence!" he thought; "she will take me for a droning old book-worm! Oh, that I might exchange some of the profundities of the craft for the graces of small-talk; for the touch and go of everyday conversation!"

"Perhaps," he continued aloud, seized by a sudden inspiration—"perhaps you have never heard of the old legend of the ivy?"

"No; I have read so little; I have studied not at all," she apologized.

"That doesn't signify," he reassured her; "it makes one stupid to study—"

"I shouldn't suspect it. But the legend—the ivy?"

"Oh yes, the ivy! Once upon a time, as all old-fashioned stories begin, there was a beautiful girl who had a lover; I dare say she had more than one—beautiful girls usually have, I believe. She had blue eyes, too, this lovely girl; I have seen eyes that resembled hers. You have blue eyes; have you not, Miss Gillian?"

"But I like brown ones better; I wish your beautiful girl had had brown eyes."

"Oh! I am positive that they were blue; the legend doesn't say so, but I have never thought of her otherwise; blue eyes are so much kinder; they absorb the light; sometimes they are like deep wells, clear as crystal, where you can detect all that goes on below; sometimes they build up walls of lapis lazuli between you and the soul beyond. The doctrine of—Excuse me. I will not digress further. Well, then, this lady with the beautiful blue eyes—ay, you may smile; a smile is to the face what sunshine is to the earth—"

"A problem in proportion," interrupted Gillian.

"An illumination, and a creative force. But we shall never catch up with the legend at this rate; so, if you will trust me, this lady treated her lover unkindly; he asked her to marry him, and she answered, 'Wait.' By-and-by he urged the question. 'A patient waiter is no loser,' she replied. But he persisted yet the third time. 'This is the last,' said he; 'if I am to wait now it will be forever.' Still she, secure in her charms, returned, 'Wait forever, then, sweet Sir.' So he took her at her word, and traveled into foreign countries; and one day she grew sick with longing for him, and she sent her messenger abroad, saying she was waiting for his return.

"And a patient waiter is no loser," he sent her answer. And so, waiting and longing, one day she died; and when the spring blossomed in the land, behold, a strange plant putting up its leaflets above her grave, which grew and thrived and waxed strong and threw out its arms in all directions, journeying further and further every day, as if reaching after something beyond, till the country people swore it was the lady's soul traveling to overtake her lover."

"What a retribution!" remarked Gillian. "Yet I would rather be traveling on his footsteps than be rooted on a grave. It would seem like growing nearer to him, as if one were, somehow, serving him."

"But what a thankless office: constant effort, with no reward in store. For, you see, she has not yet overtaken him; she still stretches and pushes forward. Root her where you will, she is off and away like any truant."

"But when one loves, you see, one doesn't stop to count the cost, or measure the recompense—at least, I suppose not."

"You are quite right. Ah, here is your father!" and then Gillian slipped away.

One night Professor Heron went to Mrs. Lavender's reception. He had had a dozen minds about going; but when, on entering, he caught sight of Gillian, he blessed his stars, and was just on the point of taking forcible possession of her, when a young man of the period whisked her off to join the Lancers. So the Professor contented himself with looking on, while this mustached youth clasped her hand and whispered in her ear. The Professor gnawed his own silky mustache dangerously; if he could only dance, he would not suffer this thing. He could reckon the flight of comets, he could weigh the universe; but I verily believe he would, at that moment, have willingly resigned his chair, and forgotten his lore, if he might thereby have been endowed with a sudden knowledge of the Lancers! Some dowagers at his elbow, but shielded from him by a curtain partially looped over their retreat, were gossiping quietly by themselves; now and then he caught a word or sentence without giving heed; now and then the flutes blew out a strain as sweet as summer wind, and drowned their chat. "They would make such a fine couple" came to him by-and-by, from he hardly knew where; had the violins spoken, or the group behind him? And of whom? Gillian and the young man in whose arms she was floating further and further away from himself—for the Lancers had dissolved into a waltz. Was this evening but an epitome of his life, in which he should always see her floating further and further away from him, in the arms of another? "They are so admirably suited to each other in years, in tastes, and pursuits," continued the taunting voice, "and Miss Gillian will have nothing when her father dies!" So, perhaps, he was not suited to Miss Gillian in any respect—so much older, so much absorbed in abstruse sciences; plainly, people had not thought of coupling them together; he would have been angry if they had, and he was now angry that they had not. At least, he would make his adieux, and go to the dressing-room for his hat. This was no place for him; there evidently *was* no place for him out of the study; he had swerved from his orbit for a little, only to find how little it comforted him; he had dreamed of a fireside and a home, but such dreams were not for him. He was moving away to put his intention into execution when Gillian waylaid him.

"You have not spoken to me to-night!" she said, poutingly.

"And you have not given me a chance," he returned, brightening.

"People who want chances usually know how to make them," she persisted. "I have been wondering what you were thinking about, leaning against the mantle there, while we were dancing. Is it an impertinence?"

"I am flattered that you find time to think of me in such society."

"One thinks such heaps of things while chaséeing with one's partner, you know."

"And *hears* so many things, too?" laughed

the Professor. "I wish I could dance, Miss Gillian."

"You! You do so many better things. I wish I could read Sanscrit, and calculate eclipses."

"Let me teach you."

"Oh, I am such a dunce; mathematics always gave me a stitch in the side. I have a total eclipse of the understanding."

It would seem that the Professor had already forgotten his intention of going home; for, instead of fulfilling it, he offered his arm to Gillian for the balcony. Why should he go now, when the evening was just opening to him; when he was beginning to feel the exhilaration of society; when he was beginning to find himself not so far out of place, after all? So he staid and promenaded the balcony, with Gillian's smiling face upturned to his, with the stars, like old familiars, looking on, as if in silent approbation.

"I am keeping you from dancing, I fear," he said at last, awkwardly enough; for how could Gillian return that she preferred it?

"Are you?" she said; "but no one has invited me to dance, you see."

"If we return to the parlors, no doubt but somebody will."

"I have bored him already," she thought, regretfully. "I am such a simpleton! Oh, I wish—I wish—"

"Miss Reed, shall I have the pleasure of the next cotillion with you?" aspired a handsome youth, while the Professor lifted the curtain for her to pass in before him.

"You see I was right," he whispered.

"You always are," indifferently, "whether you predict a comet or a cotillion." Then, in passing, she dropped a sprig of *mignonnette* from her hair; the Professor stooped and picked it up. "I will keep it?" he said, interrogatively; she looked back and laughed like a pleased child. By-and-by he saw her bestow a rose-bud from her bouquet on her partner. The Professor threw his bit of *mignonnette* away in anger. When the dancing was all done, and while he conducted Gillian to her carriage, he said to her:

"Why did you give him the rose-bud?"

"Why? Oh, because he asked for it, you know."

"And do you give whatever one asks for?"

"Every thing in reason—if I don't happen to want it myself."

"And what things are in reason?"

"Why—rose-buds and—"

"*Mignonnette*?"

"Papa says *mignonnette* is my flower; that I am like it, unobtrusive and—"

"Sweet," supplemented the Professor.

"Oh dear, I forgot; you will think I'm so vain. But you see I should only give *mignonnette* to my best—to the people I like very much. Good-night."

"Good-night," said the Professor; and then he went back into the rapidly thinning parlors,

picked up the despised sprig of *mignonnette*, and went home to his solitude and his dreams. Thus his days went on, lighted by one sweet hope; sometimes he went to Mr. Reed's, and found Gillian alone; sometimes it was Mr. Reed who was alone; at other times he sat in his study, while Gillian's face looked at him from every page of his book, and Gillian's voice echoed through the lonesome heart; and then, before he was aware of it, he would be years away in the future with Gillian—that vague, delightful future that lent itself to any shape of his imagination—for he no longer studied the sciences, unless love is a science.

Of course this sort of thing could not go on forever. He must tell Gillian about it some day. And then? Had she a suspicion of his feelings? Did she not regard him merely as a tedious book-worm, who amused her father? A sort of animated encyclopedia, very convenient to consult now and then, but good for nothing as steady reading? Thus the Professor resorted to various expedients in order to determine the nature of her regard for himself. At one time he absented himself for a week from her presence, and began to question if he did not lose more than he gained by the process, when she met him with the same smiling face, the same tranquil manner, showing nothing of all that flutter and commotion taking place under her finely fitting bodice. The perturbations of a planet could not escape the Professor, but those of a pretty woman were quite beyond his skill to detect. After this failure he tried her with the merest everyday salutation, giving her no further heed, while she sat near at work; but he observed no difference in her, or perhaps he did not know the difference when he saw it. Then he would surprise her by a sudden assumption of friendship; he would press her hand, ever so little, in saying good-by; he would put his soul into his eyes, and send it inquiring after hers; but did she blush, did the eyes sparkle unwontedly, did the hand thrill in his grasp? Sooth to say, she blushed if he but spoke of the weather; her eyes had constantly a sparkle of some hidden flame refusing to be smothered; and then the fingers of most nervous people have a touch of tremulousness, experience a kind of magnetic shock coming in contact with the fingers of another. Surely it required more wisdom, more science than Professor Heron could command to interpret the heart of this simple girl. Yet he kept it always in mind, like a hard problem, which puzzles while it fascinates, leading on through a labyrinth of figures to a wrong result.

It was about this time that Professor Heron took his summer's vacation, and found it a toil of pleasure. Never had the mountains appeared so "stale, flat, and unprofitable" before; it seemed as if the very spirit of beauty had deserted them, and they were no longer any thing but purple barriers dividing him from Gillian, which gave him a sense of imprisonment and

suffocation. All these peaks and perfect outlines, shading off and dissolving into sunlight and cloud, only suggested to him the inaccessible and unattainable. So he left them—they did not harmonize with his mood—and returned home before his vacation was half completed.

But sooner or later this doubt that was beginning to cloud his heavens must end, this hope that threatened to vanish into fear must be arrested forever, like the fleeting smile petrified on the marble face, or—he hated to remind himself of the alternative. “Why not know the worst *now*?” he thought, leaning out of his study window, in the sultry summer weather, while the stars wasted in the sky, and the morning opened like a white flower with a golden stamen. “Why not know the worst now?” Therefore, when the day was spent, when the evening was settling down upon the sleepy town, he bent his steps to the house of Mr. Reed. He found that gentleman smoking on the veranda, and listening to the pensive air which Gillian coaxed from the old upright piano, in the dark,

“If love should come, if love should go,
’Twere better so, ’twere better so!”

Then a chord snapped, and the song broke off.

“Sit down, Professor,” said Mr. Reed; “you are a welcome stranger. Gillian, bring Mr. Heron’s pipe.”

“No pipe to-night, thank you,” he said, looking at Gillian, who had appeared in the doorway like a faintly outlined shadow, the shadow of something, you would have said, which the wind agitated.

“Is that you, Miss Gillian?” asked the Professor. “Are you not afraid of the dark, alone?”

“He treats me as if I were a child,” thought Gillian, giving him the tips of her cool fingers; and then there is no love so exacting as that which deems itself slighted. “He will be soon undeceived,” she added.

“Girls know how to people the dark,” explained Mr. Reed, “with their fancies and their lovers. Gillian has hers to keep her company as well as the rest.”

“Which?” demanded the Professor, quite savagely.

“Both. Fancies as well as lovers—eh, Gillian?” But Gillian was at the piano again, drawing out long-suspended chords, like deep-drawn sighs, every one of which struck on the Professor’s heart like a blow; every one of which said to him, “I could love, but not you;” every one of which answered back to her in antiphon, “He could love, but not me.”

“Yes,” pursued Mr. Reed, while Gillian was listening to the prophecy of the chords, and Heron was trying to forget it. “Yes; my Gillian’s life has rounded into an idyl at last. You do not find us exactly where you left us, my friend. I have often remarked, that affairs go on at a dead-level for months, or it may be years; but one has only to turn one’s back before Fortune steals up and accomplishes some long-intended design. Is it not so?”

“And what,” asked the Professor—“what has she accomplished for Gillian during my absence?”

“She has sent Gillian a lover.”

“That is not strange. It has not even the advantage of being new. She had lovers before.”

“But this one has announced himself. He will not take No for an answer.”

“Then doubtless he will be rewarded with Yes. And your—daughter?”

“She leaves the decision to me.”

The Professor made no rejoinder; he did not see his way clearly.

“Well?” Mr. Reed suggested, after a pause.

“Is it well that she should have no bias, for or against?” urged Mr. Heron.

“I don’t say that she hasn’t. I have good reason to believe she has, or she would have dismissed him at once. She said to me, ‘Mr. Oxford wishes to marry me. What shall I do?’ ‘Act your pleasure, my child,’ I answered her. ‘I act my pleasure when I please you,’ she returned. ‘Mr. Oxford is devoted to me; he is handsome and high-bred; but my judgment may possibly be worthless in the case. How do I know I am doing rightly if I accept him?’”

“Her heart should teach her that,” interrupted Mr. Heron, slowly.

“But women are not to be judged after ourselves, from our own stand-point,” objected her father. “They need the judgment and sanction of old and dear friends, to whose opinion they have been used to defer. Gillian needs *your* judgment, Professor, and mine, in this business. It’s a sentimental whim of hers, I tell her; but it’s sincere, all the same.”

“Miss Gillian wants *me* to tell her when to marry!” exclaimed the Professor. “Did she ask my opinion?”

“Not precisely. I said, ‘Shall I talk to the Professor about it?’ ‘Do,’ she answered; ‘it is of vital importance to me. It is a time in which I need help.’”

“Strange,” thought the Professor. “Could any living creature, could the whole University, help me to love Gillian better, confirm my good opinion of her.”

“Well?” repeated Mr. Reed, when the silence had been sufficiently marked.

“Well,” echoed the Professor. His voice was so terribly thin and weak that, had Gillian stopped to listen, she must have known something was amiss; but she went on with her chords remorselessly.

“Mr. Oxford is a gentleman and a linguist,” he went on to say. “He is as old as I am,” to himself, in parenthesis. “He has fortune and family. I know of no one to whom a woman might intrust her happiness with greater security. I indorse Mr. Oxford in every respect.”

“Thank you, thank you, my friend,” said Mr. Reed. “I knew you would do him justice. Gillian will thank you too.”

“Miss Gillian is welcome,” still speaking in that thin, hurt voice. “The clocks are striking nine.”

"They are fast, every one of them!"

"I must love you and leave you."

"So soon? But you will be coming again; it isn't as if you were away up among the mountains," striking a match to light Mr. Heron down the steps; for it was a fancy of theirs to sit in the dark on summer nights. Mr. Reed had once laughingly observed: "Talking in the dark is like thinking out loud; one doesn't feel the restraints of an audience. Love is easier made in the dark, eh, Gillian?"

"I don't know, Sir," Gillian had replied. "I don't think I should care for love that could be put out of countenance by daylight."

"Good-night," said the Professor now, trying to speak naturally. "But, wait, here's Blank's direction, which you wished me to get for you. I took it down in my note-book. I had nearly forgotten it. 97 Rue de Beurre."

"A thousand thanks. I intend to send to him to procure me a late publication bearing on the subject of Pure Reason. I like the way the French have of treating the subject. Did you not drop something? Ah! I have it—a leaf from your note-book."

"Thanks, and good-night again," returned the Professor. "How delicious your sweet-brier is; it's enough to insure pleasant dreams to sleep in its neighborhood."

"So Gillian says."

"I shall help myself to a rose, then," continued Heron. "I want a little pleasant dreaming of my own."

Had they forgotten Gillian? She sat quite still at the piano, wondering about it. Mr. Heron had never left her like that before. Was he angry with her for having a lover, or had she no hold whatever upon his thoughts?

Mr. Reed returned soon from escorting the Professor to the gate.

"Rest easy, little one," said he; "Mr. Heron indorses Mr. Oxford in the most generous manner. He thinks Mr. Oxford is capable of making you happy, my child. This is a great comfort to me. Did you not hear him?"

"No; I was not listening. Then you told him. How did he—what did he—say?"

"I have just told you the substance of his remarks, child. He recommends Mr. Oxford to your good graces; is not that enough?" So do the best-intentioned people garble the simplest conversation.

"I am obliged to him," murmured Gillian, feebly.

"Yes; the Professor is a friend in need, a sterling gentleman. I used to think—that is, I once *half* thought he had a fancy for you himself."

"You—must—have—been—mistaken."

"Doubtless, doubtless. Besides, he would have declared himself before this. The Professor is no trifter, nor one to allow another the advantage in such an affair. When he has any thing to do, he does it with a will." It never occurred to Mr. Reed that one may be energetic in searching the heavens, speedy in following

the flight of a comet, and yet slow to believe that the planet of Love is a reality in one's own particular sky. "No," persisted Mr. Reed; "the Professor is not a marrying man, I think. He likes pretty women as one likes fine pictures, or a good prospect from the window; but there is nothing personal in his admiration of them. Sitting by one's own hearth, with wife and children glorifying it, I don't believe he ever thought of such a thing. You see he has no such needs. Science is his sweet-heart." Which shows how well Mr. Heron was comprehended by his circle of friends.

Gillian did not reply to this. Was it possible that no woman would ever touch his heart? She was suddenly afflicted with a profound pity for the sex.

She sat there long after her father had gone to rest, thinking her tiresome thoughts, bearing the burden not quite alone, for the Professor, in his lonesome study, was bearing the same burden too, but feeling it heavy upon her heart, for all that. Plainly, her little scheme had not succeeded. Mr. Heron had not fallen into the little trap her inexperience had set for him. She had thought, "If he cares the least little bit in the world for me—and sometimes I believe he does—it will move him to know that I have another lover;" not that Gillian was one to urge her lovers forward to confession, but she would fain set her heart at rest, now and forever, concerning the Professor, and she judged that she might gather some sort of assurance, pleasant or painful as it might be, from his words and actions, following on his knowledge of Mr. Oxford's designs. But as far as Gillian could understand, having trusted to the ears of another, he had dropped nothing that could lead one to suspect his feelings toward her to be other than those of a cordial friend, rejoicing in the prospect of her good fortune. Even her father had been struck by the Professor's purely friendly view of the situation, and it did not occur to Gillian to inquire if her father were one to observe faithfully in such a matter, or to comprehend efficiently, the feelings of a person with whose intellectual nature only he had held familiar intercourse.

Well, since no one loved her half so truly as Mr. Oxford, why not consent to his love? Why not make some one happy, though it should be at her own expense? Why should Mr. Oxford be made miserable because she could not "reach her rose?" He would come for his answer next week; should it be Yes, or No?

How often we are called to observe upon what slight threads our behavior hangs! If the wind had not risen a little gustily, just then, very possibly Gillian's answer would have been Yes. Victor Hugo asserts that it was only a few drops of rain which decided the fate of Waterloo; so it was but a breath of wind that interfered to Mr. Oxford's discomfiture. Very possibly he himself may have felt the wind rising, as he loitered in his spicy garden, think-

ing of Gillian and her answer to his suit; for she had desired him to take her negative as a finality, and it had only been at his express solicitation that she had been brought to consider it for the space of a week; so it may be that he felt the wind rising a little roughly, and said, "There is going to be a change of weather," little guessing how it was to affect his own fortunes. So the wind came up from the south-east, and bent the syringa-bushes, and rifled the sweet-brier, and set a bit of paper floating like a great white moth, from one end of the veranda to the other, where Gillian sat. "What on earth's that?" said she, startled by the sudden apparition of this piece of white paper that had taken wings, and then she put out her hand and captured it. She carried it into the house and turned up the gas to inspect her trophy—memoranda merely—the titles of some German scientific works—the name of a street in New York—of a firm in Holland. There was another side to the paper, however; there always is another side to every thing. She turned the leaf over and read: "*A Sonnet to Gillian!*" For a moment she covered her eyes with her hands, like one coming suddenly from the dark into a lighted room. It was an optical delusion; she did not believe in it. But when she chose to open her eyes again, there it was, and in the Professor's handwriting! And to make certain of that, she hunted up some notes he had addressed to her father, on current subjects, of no particular private interest, and compared them. There was not a shadow of doubt. It was the Professor's; he had dropped the leaf from his note-book, and it had escaped his notice. And then? Why, he must love her, after all; she should certainly not say Yes to Mr. Oxford now. How could she ever have thought of it?

Now I am aware that the Professor never intended this sonnet for publication, and that it will not at all advance his literary reputation; but in making up the sum of his mistakes I feel bound to give it in, as part and parcel thereof, premising that Mr. Heron was a lover, and not a poet:

"Shall I forget you, when long years have flown,
And all the loveliness that is your own
Has into withered wrinkles grown—
When the blue lustre of your eyes' magnificence
Is but a memory of the bitter tense?
Ah! while your heart is great as it is good,
I can not then forget you if I would.
Shall I forget you? Oh, when that shall be,
I must have lost the light from land or sea—
I must have closed my eyes eternally!
For while my heart beats, or my spirit lives,
'Mid all the hopes that gracious Heaven gives,
To love you still, as here on earth I love,
Oh, this it is that perfect heaven to prove!"

But when Gillian had slept on it, she woke up with a doubt, giving the same impression as a cloudy day when one wakes and looks for sunshine. There might be another Gillian than herself. Thus, while she poured the coffee for her father, she asked, crimsoning to the temples:

"Isn't Gillian a rare name, father?"

"Yes; I should say it was somewhat rare. You were named for your great-grandmother De Champs, who was born at sea, her parents having fled from France on the eve of St. Bartholomew."

"And you have never heard of another Gillian? I should like to be the only Gillian in the world. None of your friends have ever spoken of one—Mr. Rydal or—the Professor?"

"Why, I'm not certain about that. I've read of the name; and, now I think of it, there was a Gillian Rogers, a music-teacher, who boarded in the house with Heron last year. I remember it because he used to speak of her kindness in playing the music of Bach for him, of which he is a particular admirer."

Gillian's hand shook at this revelation, and riled the coffee. "I wish I could play the music of Bach." She was mortified that even in the seclusion of her own heart she had appropriated what had been intended for another. Then, like one drowning, she caught at the only straw that presented itself, and asked, quite humbly, recurring to the sonnet:

"I don't seem to recollect her. Was she pretty? Had she blue eyes?"

"If it hadn't been for her eyes and her music, I should have called her plain. For the music made you forget her features, and at last led you to invest them with somewhat of its own charm; and her eyes were black as sloes, and brilliant as stars."

"Then *that* is settled," said Gillian, forgetting herself, and speaking aloud.

"What is settled, child?"

"Oh—the coffee. Isn't it?"

"Indeed, I was just about to remark the contrary. However, one's coffee can't always be clear as amber. Pass the cream, Gillian. This little pitcher descended with the name. They say that little pitchers have great ears. If this one could only give us the benefit, we should hear many fine sayings of the French wits who assembled at the table of your ancestors."

But Gillian cared little for French wits or silver heir-looms just then. The possibilities of the present were more potent with her than any realities of the past, however brilliant.

But when a fortnight had elapsed, and the shadow of the Professor had not darkened their doors, Mr. Reed began to grow uneasy. As for Gillian, established in certainty, she felt that she could now wait patiently a thousand years.

"I believe I'll go down to the Professor's room," said Mr. Reed at last, "and ask him up to tea to-night." But he returned in short metre, alone and discomfited.

"What do you suppose has possessed the man, Gillian?" he asked. "If you will believe it, he has packed up and gone off to the Continent!"

Gillian answered with a vacant stare.

"I feel hurt," continued her father—"never to come and say good-by. Can we have offended him?"

"Is it the Professor ye's telling of?" asked

the servant, who was busying herself in the room. "Sure an' he left a card of his own, an' I put it in the basket, thinking ye'd be after seeing it, to be sure; an' if ye didn't, he'd be coming again, an' it wasn't no great matter no way."

So the card was hunted up, and found to be the bearer of this message, in pencil:

"Sorry not to find you in. Came to say good-by to you all. I sail in the *Petrel*, for Havre, to-morrow. Hope to see you again three years hence; so don't forget. Yours truly,
RAYMOND HERON."

"Very satisfactory!" growled Mr. Reed.

"Very sudden!" commented Gillian. "Very mysterious—very, *very*, VERY cruel!" she added, in the solitude of her heart, where a great deal was going on, silently and painfully. Three years! What should she do with them?

"Mr. Oxford is in the drawing-room, Miss Gillian," announced the servant.

"He has come for his answer," whispered her father.

"I know it," returned his daughter.

"I confess myself favorable to him. Nothing can be urged against him. And then, Gillian, remember the Professor."

"*I shall remember the Professor!*" and passed into the drawing-room.

Three years, that seem such an eternity to the young, who have not learned the art of waiting gracefully—even three years have an end, be they ever so barren of pleasure or fruitful of pain.

"And so does a continental tour," thought Professor Heron, pulling at Mr. Reed's door-bell. "Am I cured, or only convalescent? Or is love like rays of light, which reach and influence us long after the star has left its place in heaven?"

He found Gillian watering her plants, which three years of painstaking had created into a

sort of fragrant wilderness, filling an entire alcove of the parlor.

"Good-morning!" said he, with the most cordial manner at his command. "I hope I find you well, and that three years have not sufficed to erase me from your memory."

"Professor Heron! I am glad to see you. You bewildered me for an instant."

"I can understand it. When one is not thinking of a person who is supposed to be at the other end of the earth—"

"That's just it. I *was* thinking of you; and I was bewildered at having my thought realized so suddenly."

"Thank you, Mrs. Oxford; this is a most gracious welcome home."

"Mrs. Oxford!" repeated Gillian, laughing. "I don't know her. You are mistaken. I am Miss Gillian still. Nobody has taken pity upon me."

"So much the worse for them. But when I left, you were going to take pity upon Mr. Oxford. How is this?"

"I did not love Mr. Oxford, Mr. Heron," she answered, quietly.

"Miss Gillian," pursued the Professor, "I believe I made a mistake in going away."

"Do you?" said Gillian, moving her fingers nervously.

"Do you think I made another in coming back?" He had her hand now, and was reading her face with an interest he had never given to "La Verrier," to Greek ode or Latin hexameter. "Do you think I made another mistake in coming back, Gillian, to ask—to beg for your love?"

"I hope you may never have reason to think so," she answered him. "I should not like to be called *Professor Heron's Mistake*, you know," she laughed; "and as to the rest, why, one has a right to ask for one's own."

"And *you* are my own?"

"Yes."

RECOLLECTIONS OF WILLIAM MAKEPEACE THACKERAY.

By GEORGE HODDER.

IN approaching the name of William Makepeace Thackeray I feel a degree of delicacy, and even timidity, which his absence from the scene of his world-wide renown does not tend to diminish; for Thackeray was a man of such large mental proportions, and such far-seeing power in his mode of anatomizing and criticising human character, that one seems to be treading on volcanic ground in venturing to deal with him at all. But of what is biography composed? Assuredly not of the knowledge and experience of one privileged person, but of the aggregate contributions of many, who are willing, when occasion offers, to state what they know for the information and benefit of posterity. A hundred admirers of Thackeray might undertake to write a memoir of him, and yet the task of doing full justice to his character

and career must necessarily be left to a chosen future historian, who shall zealously gather together all the bits and fragments to be found scattered among books and men, and blend them into a substantial and permanent shape. But it must be admitted that there is an exceptional difficulty in regard to Thackeray, inasmuch as there were few whom he allowed to *know* him, in the true sense of the phrase—that is to say, there was a constitutional reserve in his manner, accompanied, at times, by a cold austerity which led to some misgivings as to the possibility of his being the pleasant social companion his intimates often described him to be. And yet it is well known to those who saw much of Thackeray in his familiar moments that he could be essentially "jolly" (a favorite term of his) when the humor suited him, and

that he would, on such occasions, open his heart as freely as if the word "reticence" formed no part of his vocabulary; whereas, at other times, he would keep himself entirely within himself, and answer a question by a monosyllable, or peradventure by a significant movement of the head. At one moment he would look you full in the face and greet you jauntily; at another he would turn from you with a peculiar waving of the hand, which of course indicated that he had no desire to talk. Men who were members of the same club with him have been heard to say that sometimes he would pass them in the lobbies unnoticed, and at others he would cheerfully initiate a conversation, and leave behind him an impression that sullenness or *hauteur* was wholly foreign to his nature. It should be stated, however, that his health for many years had never been entirely unimpaired, and that his acute sensibility often rendered it irksome to him to come in contact with his fellow-men. In short, he was essentially of a nervous temperament, and altogether deficient in that vigorous self-possession which enables a man to shine in public assemblies; for it was absolute pain to him to be called upon to make a speech, and even in ordinary conversation he showed no particular desire to hold a prominent place. But, the above considerations apart, it would be easier to know many men in a few days than it would be thoroughly to understand Thackeray in the same number of years. Douglas Jerrold, dating his acquaintance with Thackeray from the time that the latter, by some curious hazard, illustrated his book of "Men of Character," was often heard to say, "I have known Thackeray eighteen years, and I don't know him yet." But that the great novelist and satirist had a generous and sympathetic heart can hardly, I think, be disputed; and even the few brief letters which I received from him are sufficient to prove that, however austere he sometimes appeared to be externally, he was very rarely wanting in readiness to perform a kind office.

At one period of my intercourse with Mr. Thackeray I had been reading his "Journey from Cornhill to Grand Cairo," and, having always been an enthusiastic admirer of his writings, long before I knew that the "Michael Angelo Titmarsh" of *Fraser's Magazine* was identical with W. M. Thackeray, I could not refrain from expressing to him by letter the delight I had drawn from his Egyptian pages. Among other things, I remember being deeply impressed by the graphic power displayed in the poem of "The White Squall," and by the charming burst of parental feeling with which it concludes.*

* "And when, its force expended,
The harmless storm was ended,
And as the sunrise splendid
Came blushing o'er the sea;
I thought as day was breaking,
My little girls were waking,
And smiling, and making
A prayer at home for me."

Mr. Thackeray's answer was as follows:

"DEAR HODDER,—I thank you very much for your note, and am very glad that my little book has given you pleasure. I hope that the future works of the same author will please you, and, indeed, am quite anxious to have as many people as may be of your opinion. It is not my intention to return to Constantinople at present, and when there I hope I shall be more moral than in former days, and have no desire to fling the handkerchief to any members whatsoever of his Highness's seraglio.

"Yours truly, W. M. THACKERAY."

I can not at this distant date precisely call to mind the circumstances under which I continued, at intervals, to meet Mr. Thackeray, but the various letters I received from him contain the most gratifying proof that he was always well affected toward writers who could not possibly aspire to his own rank in the literary army; and the following extract is one of the best evidences of this fact I can adduce, because, at the time he wrote it, my knowledge of him did not extend beyond that which was derived from a few brief conversations with him at the chambers of a friend, upon matters in no way relating to business, such as afterward brought me more closely in contact with him.

The letter refers to a loss which had just befallen me, in consequence of some changes which had taken place in a newspaper establishment with which I was then connected. It is dated May 19, 1855, and says:

"I am sincerely sorry to hear of your position, and send the little contribution which came so opportunely from another friend whom I was enabled once to help. When you are well-to-do again I know you will pay it back, and I dare say somebody else will want the money, which is meanwhile most heartily at your service."

It was afterward explained to me that Mr. Thackeray made a practice of acting upon the principle embodied in the above note. Like many other generous men, he had always a few pounds floating about among friends and acquaintances whom he had been able to oblige in their necessity, and whenever he received back money which he had lent, he did not put it into his pocket with a glow of satisfaction at having added so much to his exchequer; but congratulated himself that he could transfer the same sum to another person who he knew was in need of it.

To my great satisfaction, I received one evening a note from Mr. Thackeray, which I had been expecting for several days, as he had promised to write to me on the subject; but, as the delay seemed ominous, I began to think he had changed his determination, and would not require my services as now suggested. In this note, which is dated Onslow Square, September 6, 1855, he says, after referring to other matters:

"I want a little work done in the way of arranging papers, copying at the B. M., etc.—if you are free, and will come here on Tuesday morning next, I can employ your services, and put some money in your way."

To Onslow Square I accordingly went on the

morning fixed upon, and found Mr. Thackeray in his study to receive me; but, instead of entering upon business in that part of the house, he took me up stairs to his bedroom, where every arrangement had been made for the convenience of writing. I then learned that he was busily occupied in preparing his lectures on the "Four Georges," and that he had need of an amanuensis to fill the place of one who was now otherwise occupied. In that capacity, it was my task to write to his dictation, and to make extracts from books, according to his instructions, either at his own house or at the British Museum. This duty called me to his bedchamber every morning, and, as a general rule, I found him up and ready to begin work, though he was sometimes in doubt and difficulty as to whether he should commence operations sitting, or standing, or walking about, or lying down. Often he would light a cigar, and, after pacing the room for a few minutes, would put the unsmoked remnant on the mantle-piece, and resume his work with increased cheerfulness, as if he had gathered fresh inspiration from the "gentle odors" of the "sublime tobacco."

It was not a little amusing to observe the frequency with which Mr. Thackeray, in the moments of dictation, would change his position, and I could not but think that he seemed most at his ease when one would suppose he was most uncomfortable. He was easy to "follow," as his enunciation was always clear and distinct, and he generally "weighed his words before he gave them breath," so that his amanuensis seldom received a check during the progress of his pen. He never became energetic, but spoke with that calm deliberation which distinguished his public readings; and there was one peculiarity which, among others, I especially remarked, viz., that when he made a humorous point, which inevitably caused me to laugh, his own countenance was unmoved, like that of the comedian Liston, who, as is well known, looked as if he wondered what had occurred to excite the risibility of his audience.

Many authors have often declared that they could not write to dictation. Thackeray was one who *could*, and liked to do so; and no better proof need be afforded of his power in that respect than is to be found in his "Four Georges," which contain some of the most thoughtful and vigorous passages that ever emanated from his brain.

While I was thus daily engaged with Mr. Thackeray he sometimes required my assistance on a Sunday afternoon; and I call to mind one Sunday in particular—I think it was the last before he started for America—when I found him in exceptionally high spirits, and much more inclined to talk than to write. He spoke of the journey he was about to commence, and of the money he should probably make by his readings in America. He wanted a few thousands more, he said, for he had not yet made enough. True, he added, that he possessed a small share

of the world's goods, and he was happy to think that he had paid off one moiety of the cost of his house (which he then occupied), and that he should be able before he left the country to discharge the remainder of the liability. He then went on to relate some of his literary experiences, and the circumstances under which his fortunes had improved during the last few years, observing that lecturing was certainly more profitable than magazine writing. He next alluded to his friends, the contributors to *Punch*, and passed in review many of their virtues and idiosyncrasies; and was at some pains to show that he held the humorous brotherhood in high esteem.

In speaking of periodical literature, he said he contemplated producing a magazine or journal in his own name after his return from America; and upon my venturing to observe that I hoped he did not intend to encourage the anonymous system in regard to his contributors, as the conductors of other publications of the day seemed resolved to do, he replied, "No. I think that's hard lines."* Our conversation next turned upon his mission to the United States; and when he hinted at the probability of his taking a secretary with him, as he had done on his former visit to that country, I suggested that I should be delighted to fill that office, if he had not already selected some one. He promised to consider my suggestion, and let me know what determination he had arrived at; but, in the mean time, he feared he should require a valet more than a secretary. On the following morning he said he had turned the matter over in his mind, and had come to the conclusion that, in consequence of the state of his health, he should be obliged to take a servant with him instead of a secretary; adding, dryly, "I can ask a servant to hold a basin to me; but I doubt if I could so treat a secretary—at least, he *might* object." He smiled as he made this droll observation, but I too well knew that it was a true word spoken in jest; for he was subject to periodical illnesses which rendered the services of a valet most essential to him; and the young man who filled that situation at the time was fortunately one in whom he placed implicit confidence; and he was thankful for the gentle way in which his servant tended him.

It was but natural to suppose that, considering Mr. Thackeray's popularity among his friends, and the interest which attached to the object of his visit to America, a desire would be shown to invite him to a farewell dinner. The project being initiated, Mr. Peter Cunningham undertook the duties of secretary; and all the preliminary arrangements were of the most satisfactory kind, care being taken that the party should be entirely private, and that it should consist exclusively of Mr. Thackeray's intimates.

* On his return to England, the *Cornhill Magazine* was started under the editorship of Mr. Thackeray.

On the morning of the banquet he was in a state of great nervous anxiety, saying that it was very kind of his friends to give him a dinner, but that he wished it was over, for such things always set him trembling. "Besides," he exclaimed, "I have to make a speech, and what am I to say? Here, take a pen in your hand and sit down; and I'll see if I can hammer out something. It's hammering now; I'm afraid it will be *stammering* by-and-by." I did as he requested, and he dictated with much ease and fluency a speech—or rather the heads of a speech—which he proposed delivering in response to the inevitable toast of his own health.

This was on a morning in the first week of October, 1855, and the dinner took place at the London Tavern in the evening of the same day, the duties of chairman being delegated to Mr. Charles Dickens, who from the very beginning of his public career had always manifested a remarkable aptitude for that responsible office.

The following account of the affair was afterward published by a gentleman who was present on the occasion:

"The Thackeray dinner was a triumph. Covers, we are assured, were laid for sixty; and sixty and no more sat down precisely at the minute named to do honor to the great novelist. Sixty very hearty shakes of the hand did Thackeray receive from sixty friends on that occasion; and hearty cheers from sixty vociferous and friendly tongues followed the chairman's—Mr. Charles Dickens—proposal of his health, and of wishes for his speedy and successful return among us. Dickens—the best after-dinner speaker now alive—was never happier. He spoke as if he was fully conscious that it was a great occasion, and that the absence of even one reporter was a matter of congratulation, affording ample room to unbend. The table was in the shape of a horseshoe, having two vice-chairmen, and this circumstance was wrought up and played with by Dickens in the true Sam Weller and Charles Dickens manner. Thackeray, who is far from what is called a good speaker, outdid himself. There was his usual hesitation; but this hesitation becomes his manner of speaking and his matter, and is never unpleasant to his hearers, though it is, we are assured, most irksome to himself. This speech was full of pathos and humor and oddity, with bits of prepared parts imperfectly recollected, but most happily made good by the felicities of the passing moment. Like the 'Last Minstrel,'

'Each blank in faithless memory's void
The poet's glowing thought supplied.'

It was a speech to remember for its earnestness of purpose and its undoubted originality. Then the chairman quitted, and many near and at a distance quitted with him. Thackeray was on the move with the chairman, when, inspired by the moment, Jerrold took the chair, and Thackeray remained. Who is to chronicle what now passed?—what passages of wit—what neat and pleasant sarcastic speeches in proposing healths—what varied and pleasant, ay, and at times, sarcastic acknowledgments? Up to the time when Dickens left, a good reporter might have given all, and with ease, to future ages; but there could be no reporting what followed. There were words too nimble and too full of flame for a dozen Gurneys, all ears, to catch and preserve. Few will forget that night. There was an 'air of wit' about the room for three days after. Enough to make the two companies, though downright fools, right witty."

I am now fortunately enabled to give the original draft of the speech thus pictured, and

which, as I have just stated, was written by me to Mr. Thackeray's dictation on the morning of the dinner. It will be seen, from the occasional vacant spaces, that the writer of the above was correct in assuming that the speaker had intentionally left blanks with the view of supplying them at the moment. Some few sentences will be found to be quite incomplete; but it is not very difficult to conjecture how Mr. Thackeray would fill them up; though I believe I am right in saying that the speech as delivered fell far short of the speech as written. The latter has never been out of my possession since it came from Mr. Thackeray's lips; for, having once tested his power, and brought to light the thoughts which animated him, he did not care for the MS., and did not even read it. I subjoin it, *ipsissima verba*:

"I know great numbers of us here present have been invited to a neighboring palace where turtle, Champagne, and all good things are as plentiful almost as here, and where there reigns a civic monarch with a splendid court of officers, etc.—The sort of greeting that I had myself to-day—this splendor, etc.—the bevy in the ante-room—have filled my bosom with an elation with which no doubt Sir Francis Graham Moon's throbs.* I am surrounded by respectful friends, etc.—and I feel myself like a Lord Mayor. To his lordship's delight and magnificence there is a drawback. In the fountain of *his* pleasure there surges a bitter. He is thinking about the 9th of November, and I about the 13th of October.†

"Some years since, when I was younger and used to frequent jolly assemblies, I wrote a Bacchanalian song, to be chanted after dinner, etc.—I wish some one would sing that song now to the tune of the 'Dead March in Saul,' etc.—not for me—I am miserable enough; but for you, who seem in a great deal too good spirits. I tell you I am not—all the drink in Mr. Bathe's‡ cellar won't make me. There may be sherry there 500 years old—Columbus may have taken it out from Cadiz with him when he went to discover America, and it won't make me jolly, etc.—and yet, entirely unsatisfactory as this feast is to me, I should like some more. Why can't you give me some more? I don't care about them costing two guineas a head. It is not the turtle I value. Let us go to Simpson's fish ordinary—or to Bertolini's, or John o' Groat's, etc.—I don't want to go away—I cling round the mahogany-tree.

"In the course of my profound and extensive reading I have found it is the habit of the English nation to give dinners to the unfortunate. I have been living lately with some worthy singular fellows 150 or 160 years old. I find that upon certain occasions the greatest attention was always paid them. They might call for any thing they liked for dinner. My friend Simon Frazer, Lord Lovat, about 109 years since, I think, partook very cheerfully of minced veal and sack before he was going on his journey§—Lord Ferrers (Rice)||—I could tell you a dozen jolly stories

* Sir F. G. Moon, Bart., was at that time Lord Mayor of London.

† The day on which he was to start for America.

‡ The then proprietor of the London Tavern.

§ He was beheaded in the year 1745 for fighting in the cause of the Pretender, in the Scottish rebellion of 1745.

|| Executed at Tyburn in the year 1760 for the murder of one Johnson, the receiver of his estates. His lordship was allowed to ride from the Tower to the scaffold in his own landau, and appeared gayly dressed in a light-colored suit of clothes, embroidered with silver. It was doubtless to this circumstance that Mr. Thackeray intended to allude in filling up the vacuum.

about feasts of this sort. I remember a particularly jolly one at which I was present, and which took place at least 900 years ago. My friend Mr. Macready gave it at Fores Castle, North Britain, Covent Garden. That was a magnificent affair indeed. The tables were piled with most splendid fruits—gorgeous dish-covers glittered in endless perspective—Macbeth—Macready, I mean—taking up a huge gold beaker, shining with enormous gems that must have been worth many hundred millions of money, filled it out of a gold six-gallon jug, and drank courteously to the general health of the whole table. Why did he put it down? What made him, in the midst of that jolly party, appear so haggard and melancholy? It was because he saw before him the ghost of John Cooper, with chalked face and an immense streak of vermilion painted across his throat! No wonder he was disturbed. In like manner I have before me at this minute the horrid figure of a steward, with a basin perhaps, or a glass of brandy-and-water, which he will press me to drink, and which I shall try and swallow, and which won't make me any better—I know it won't.

“Then there's the dinner, which we all of us must remember in our school-boy days, and which took place twice or thrice a year at home, on the day before Dr. Birch expected his young friends to reassemble at his academy, Rodwell Regis. Don't you remember how the morning was spent? How you went about taking leave of the garden, and the old mare and foal, and the paddock, and the pointers in the kennel; and how your little sister wistfully kept at your side all day; and how you went and looked at that confounded trunk which old Martha was packing with the new shirts, and at that heavy cake packed up in the play-box; and how kind ‘the governor’ was all day; and how at dinner he said ‘Jack—or Tom—pass the bottle’ in a very cheery voice; and how your mother had got the dishes she knew you liked best; and how you had the wing instead of the leg, which used to be your ordinary share; and how that dear, delightful, hot raspberry roly-polly pudding, good as it was, and fondly beloved by you, yet somehow had the effect of the notorious school stick-jaw, and choked you and stuck in your throat; and how the gig came; and then, how you heard the whirl of the mail-coach wheels, and the tooting of the guard's horn, as with an odious punctuality the mail and the four horses came galloping over the hill.—Shake hands, good-by! God bless every body! Don't cry, sister.—Away we go! and to-morrow we begin with Dr. Birch, and six months at Rodwell Regis!

“But after six months came the holidays again! etc., etc., etc.”

There is small chance of it being denied that the above is as fully characteristic of Mr. Thackeray's peculiar style as any passage to be found in his works. Not a doubt or question could possibly be raised in regard to its authorship; for there spoke Thackeray in his own original way—heart, lips, tone, and language.

That Mr. Thackeray was sometimes given to the “melting mood” may be shown by a little incident, in the relation of which I trust I shall violate no confidence, or throw myself open to the charge of ascribing to the great author a larger share of the milk of human kindness than often falls to the lot of ordinary mortals.

One morning I was making my way to 36 Onslow Square, at an earlier hour than usual, when, to my great surprise, I met Mr. Thackeray pacing up and down the footway in a state of great mental uneasiness. It was so entirely

contrary to his custom—at least as far as my experience told me—to leave his house at so early an hour, and I was so much concerned at seeing him in such depression, that I was naturally induced to say that I hoped nothing very serious had happened to his household. He answered, “Poor Marochetti's child is dying.” Having said this, tears came to his relief, and he speedily returned home. He was on terms of close friendship with the Baron Marochetti (his next-door neighbor), and he sympathized with that well-known sculptor in the deep love he bore for his dying child. He was in a cheerless mood for the remainder of the day, and in the course of his work reverted many times to the calamity which he so much deplored.*

Again, on the morning of his departure for America. He was to start by an early train, and when I arrived (for it had been previously arranged that I should see him before he left) I found him in his study, and his two daughters in the dining-room—all in a very tearful condition; and I do not think I am far wrong in saying that if ever man's strength was overpowered by woman's weakness it was so upon this occasion; for Mr. Thackeray could not look at his daughters without betraying a moisture in his eyes, which he in vain strove to conceal. Nevertheless he was enabled to attend to several money transactions which it was necessary he should arrange before leaving; and to give me certain instructions about the four volumes of his “Miscellanies” then in course of publication, and which he begged me to watch in their passage through the press, with a view to a few foot-notes that might be thought desirable. Then came the hour for parting! A cab was at the door, the luggage had all been properly disposed of, and the servants stood in the hall, to notify, by their looks, how much they regretted their master's departure. “This is the moment I have dreaded!” said Thackeray, as he entered the dining-room to embrace his daughters; and when he hastily descended the steps of the door he *knew* that they would be at the window to

“Cast one longing, lingering look behind.”

“Good-by,” he murmured, in a suppressed voice, as I followed him to the cab; “keep close behind me, and let me try to jump in unseen.”

The instant the door of the vehicle was closed behind him he threw himself back into a corner and buried his face in his hands. That was the last I saw of Mr. Thackeray before he left London on his second visit to the United States; and I think I have given sufficient proof that, great as was his power of poisoning the shafts of ridicule at the follies and vices of the day, and coldly reserved as he sometimes was in his demeanor, he was full of that gentle-

* Mr. Thackeray was to be absent from England for that space of time.

* It will be recollected that the tablet to Thackeray's memory in Westminster Abbey was the design and workmanship of the late Baron Marochetti.

ness of heart to which his writings constantly bear testimony; and it was his instinct to be actuated by the kindest impulses which do honor to our common nature.

On Mr. Thackeray's return from a successful tour in the United States, he sought to make arrangements for the reading of his lectures on "The Four Georges" in London and the provinces. He had fulfilled his purpose of delivering them in America in the first instance, and he had now no reason to think that they would not be listened to with satisfaction in his own country. To undertake the responsibility of organizing any plan of proceeding, of appointing agents, of superintending the publication of advertisements, and settling the various other preliminary matters incidental to what is technically called a "lecturing tour," was, of course, more than could possibly be expected from a man of Mr. Thackeray's intellectual calibre. It soon, therefore, became known that he was "in the market," as it were, ready to accept engagements for the reading of his lectures; and Mr. Frederick Beale, belonging to a musical firm of some note, expressed his desire to Mr. Thackeray, through me, to make the speculation his own, and to "farm" the lecturer at a given sum for each reading. Mr. Thackeray appeared pleased at the proposition, and a morning was appointed for Mr. Beale to accompany me to his house, with a view of my introducing him to the celebrated writer, and witnessing the arrangement of the terms.

Mr. Thackeray was in his dressing-gown and slippers, and received us in his bedroom, where, as I have already stated, he generally passed his mornings and wrote his books. His study being a small back-room behind the dining-room, on the ground-floor, and being exposed to the noises from the street, he had caused his writing-table and appliances to be carried up stairs to the second-floor, where two rooms had been thrown into one—the back to be used as a sleeping-chamber, and the front, which was considerably larger than the other, as a sitting-room. The dimensions of this apartment being capacious, Mr. Thackeray was enabled to move about in the intervals of writing, and to extend his limbs on a couch; and, in fine, to change his attitude as often as his convenience demanded, for the operation of dictating necessarily spared him the pain of confining himself to a sitting posture. On the morning in question some domestic annoyance had ruffled the serenity of his mind; and it was evident, from the abruptness of his manner, that he had no idea of being other than thoroughly "business-like" in the negotiations we were about to commence. After a little preparatory interchange of civilities (which it was pretty evident Mr. Thackeray would have described as a "bore" had it been possible to ascertain his candid opinion at the moment), Mr. Beale, in his usual courteous manner, suggested the terms himself; and Mr. Thackeray, like a true diplomatist as he was, never allowed it to be sup-

posed that he thought them more than reasonably remunerative.

The payment proposed was fifty guineas for each reading, and Mr. Thackeray was to appear a certain number of times in London—at the Surrey Music Hall, for instance—and to undertake a tour of three weeks in the provinces. That he was well satisfied with his arrangement with Mr. Beale is best proved by the fact that, when he saw me on the following day, he exclaimed, "What terms! fifty guineas a night! Why, I shouldn't have received one-half that sum for an article in *Fraser* a few years ago."

As I was traveling entirely in an official character, and was not responsible to Mr. Thackeray, I studiously avoided forcing myself on his company, but always took especial care to select a carriage he did *not* occupy, and to plant myself in an hotel he did *not* patronize. Hence—if I may speak paradoxically—we pulled remarkably well together; and although the arrangements for a public reading every evening at 8 o'clock left little opportunity for social enjoyment—that is to say, at a time when it would be most in accordance with his usual habit—Mr. Thackeray occasionally invited me to dine with him. "This is a nice room," he would say, if the apartment allotted to him chanced to have a rural aspect, with trees and flowers bobbing in at the window; "I could *write* here!" And where was it, it may be asked, that he could *not* write? for the twenty-two handsome volumes of his works lately issued bear sufficient presumptive evidence that his labor was done in various places and climes. May it not be fairly supposed that Titmarsh's "Carmen Lillienne," dated Lille, September 2, 1843, and published in *Fraser's Magazine*, was written on the identical spot where he was visited by the sad pecuniary misfortune which he so humorously deplores in the *refrain* of the ballad?

"My heart is weary, my peace is gone;
How shall I e'er my woes reveal?
I have no money; I lie in pawn,
A stranger in the town of Lille."

At the time of the publication of "Vanity Fair," Thackeray's great contemporary, Charles Dickens (for in spite of all remonstrance it has always been the fashion to place the two writers in the same category, and often to sacrifice one at the shrine of the other, according to the particular taste of the person addressing himself to the subject), was producing, in the accustomed monthly form—the green cover in the one instance, against the yellow cover in the other—his story of "Dombey and Son;" and it was Thackeray's delight to read each number with eagerness as it issued from the press. He had often been heard to speak of the work in terms of the highest praise. When it had reached its fifth number, wherein Mr. Charles Dickens described the end of little Paul with a depth of pathos which produced a vibratory emotion in the hearts of all who read it, Mr.

Thackeray seemed electrified at the thought that there was one man living who could exercise so complete a control over him. Putting No. 5 of "Dombey and Son" in his pocket, he hastened down to Mr. Punch's printing-office, and entering the editor's room, where I chanced to be the only person present except Mr. Mark Lemon himself, he dashed it on the table with startling vehemence, and exclaimed, "There's no writing against such power as this—one has no chance! Read that chapter describing young Paul's death: it is unsurpassed—it is stupendous!"

Long after this, and during the period that I acted as his amanuensis, I went into his chamber one morning, as usual, and found him in bed (for, lest it should be supposed that Mr. Thackeray was what is commonly called a late riser, I should state at once that my visits to him were somewhat early, that is to say, before nine o'clock), a little pot of tea and some dry toast on a table by his side. I therefore remained at a distance from him, but Mr. Thackeray called me forward, and I discovered that he had passed a very restless night. "I am sorry," said I, "that you do not seem very well this morning." "Well!" he murmured—"no, I am not well. I have got to make that confounded speech to-night." I immediately recollected that he was to preside at the annual dinner of the General Theatrical Fund—an undertaking which I well knew was entirely repugnant to his taste and wishes. "Don't let that trouble you, Mr. Thackeray," said I; "you will be sure to be all right when the time comes." "Nonsense!" he replied, "it won't come all right—I can't make a speech. Confound it! That fellow Jackson let me in for this! Why don't they get Dickens to take the chair? He *can* make a speech, and a good one. *I'm* of no use." I told him that I thoroughly appreciated his remark in regard to Mr. Dickens, but that at the same time he was giving little credit to those whose discernment had selected him as the chairman of the evening; and they could not very well ask Mr. Dickens, as he had only a year or two since occupied that position at an anniversary dinner of the same institution. "They little think how nervous I am," said Thackeray; "and Dickens doesn't know the meaning of the word."

In confirmation of this remark I observed that I once asked Mr. Dickens if he ever felt nervous on public occasions when called upon to speak; and his instant reply was, "Not in the least. The first time I took the chair at a public dinner I felt just as much confidence as if I had done the same thing a hundred times before."*

* Charles Dickens is as happy at intimate social gatherings as on great public occasions. A dinner was given to his eldest son on the occasion of his departure for China on a commercial mission. Blanchard Jerrold was in the chair, with Mr. Dickens on his left, and the guest of the evening on his right. The young gentleman became warmed with the wine;

The result of Mr. Thackeray's chairmanship on the evening in question may here be recorded, with all respect to his memory, and with that desire to be strictly correct which he himself would have been the first to encourage. True to his engagement he took the post assigned to him, and commenced his duties as if he had resolved to set difficulties at defiance, and to show that the task was *not* quite impossible with him; but, unhappily for his nervous and sensitive temperament, Mr. Charles Dickens, as the president of the institution, sat at his right hand, and when he came to the all-absorbing toast of the evening, the terrifying fact rushed across his mind that his great contemporary would witness all his shortcomings and his sad inferiority. He had prepared his speech, and he commenced with some learned allusions to the car of Thespis and the early history of the drama, when he suddenly collapsed, and brought his address to a close in a few commonplace observations which could scarcely be called coherent. He too painfully felt the weakness of his position; and notwithstanding a particularly kind and complimentary speech in which Mr. Dickens proposed his health as chairman, he could not recover the *prestige* he believed he had lost, and he left the room in company with an old friend at as early a moment as he could consistently with the respect he owed to the company.

One other instance I may mention of the many which came within my own knowledge of Mr. Thackeray's distrust of his own powers and his desire to exalt others at the expense of himself. I found him one morning in an unusually loquacious mood, and I had not been with him many minutes before he said he was not disposed to trouble himself with any work that day. He was more inclined to talk. Adverting by a natural transition from the subject he had first touched upon to the respective merits of various writers who were then daily before the world, he spoke of the great success of *Household Words*, and of the ability displayed in its pages by some of its contributors. "There's one man," for instance, he emphatically exclaimed, "who is a very clever fellow, and that is Sala. That paper of his, 'The Key of the Street,' is one of the best things I ever read. I couldn't have written it. I wish I could."

It was a common practice in the towns we visited for quidnuncs, ambitious dowagers, and aspiring damsels pertaining to the order of blue-stockings, to pester Mr. Thackeray at the close of his lecture to insert his autograph in an album—a request with which he was not often willing to comply. On one occasion an album was placed before him by a young fellow, who thought to tempt him by calling attention to the fact that the signatures of several distin-

whereupon Dickens, in returning thanks for his own health, took the opportunity of observing that after such a generous dinner "a little transaction in tea" would do his son a world of good.

guished musicians, including that of one of our most celebrated tenors, were in the same book, and that therefore he would be in very good company. "What! among all these fiddlers!" exclaimed Thackeray, with pretended raillery. Having uttered the somewhat brusque phrase, he could not well do otherwise than satisfy the desire expressed; but he would not be prevailed upon to write more than the simple signature—"W. M. Thackeray." On another occasion the possessor of an album was much more fortunate. It belonged to a young lady of my acquaintance, and I had pleaded her cause so warmly that Mr. Thackeray opened the book, and I pointed out to him the names of certain contributors with whom I thought he might not object to be thus associated. He assented, and took the book home to his hotel, in order that he might have time to scan its contents. Among these he soon discovered the subjoined lines:

"Mont Blanc is the Monarch of Mountains—
They crown'd him long ago;
But who they got to put it on
Nobody seems to know.

"ALBERT SMITH."

Under these lines Mr. Thackeray speedily wrote the following:

"A HUMBLE SUGGESTION.

"I know that Albert wrote in hurry:
To criticise I scarce presume;
But yet methinks that Lindley Murray,
Instead of 'who,' had written *whom*.
"W. M. THACKERAY."

I need scarcely say that the young lady felt she had brought her album to a "very good market," and she could never afterward believe that Mr. Thackeray was other than the most amiable of authors and the most considerate of men.

If I remember rightly, Mr. Thackeray's engagement at Norwich required him to give four readings—that is to say, he was to introduce all "The Four Georges"—one each night—to the people of that city. He was received with much cordiality in that bustling capital, and his lectures were attended with a success justly proportioned to their merit; but it was evident that his health was much impaired, and that he was about to endure one of those sad periodical attacks to which he had long been liable. On the concluding night of the series he had some difficulty in getting to the Hall by the usual time, and when arrived there he was in great nervous trepidation, and expressed his fear that he should be quite unable to get through his work. I said what I could to make him more hopeful and cheerful, and when he made his appearance on the platform he was greeted with such a storm of applause, that he proceeded in his task with scarcely less vigor than he generally displayed; but as he approached the end of his discourse his voice faltered, and it was a severe struggle to him to reach the final sentence.

On the following morning, at an early hour,

I received a message from him requesting that I would go and see him at his hotel, as he was laid up with one of his violent attacks. I lost no time in obeying his wish, and on entering his chamber I was much shocked to see him lying closely covered up in bed. He was suffering great pain, and begged that I would not look at him, as he knew he was a hideous object. I entreated that he would place my services entirely at his command, and he replied, with a waving of his hand, that all he wanted was some money out of the exchequer in my possession, as he should unfortunately be detained there by his illness. The desire was of course immediately satisfied, and he would not listen to me when I asked him to allow me to remain with him. It was beyond question under such a seizure as he was then afflicted with that he retired to his bed on that mournful night in December, 1863, when he endured his sufferings for the last time.

Some short period after I had left Mr. Thackeray at Norwich in the condition described, I saw him at his house in London, and on his making allusion to those dreadful illnesses which he said were the very bane of his life, I asked if he had ever received the best medical advice. Certainly he had, was his reply; "but what is the use of advice, if you don't follow it?" he continued. "They tell me not to drink, and I *do* drink. They tell me not to smoke, and I *do* smoke. They tell me not to eat, and I *do* eat. In short, I do every thing that I am desired *not* to do, and, therefore, what am I to expect?"

As I was brought little in contact with Mr. Thackeray from this time forth, except in the lobby of the Reform Club (where, on occasions when I was waiting for a friend who was a member, I enjoyed the sight of forbidden luxuries), or on the steps of the Garrick, or sauntering along Pall Mall in that *insouciant* manner which was becoming as familiar at the West of London as Johnson's "rolling walk" was in Fleet Street, I shall not weary the reader with any details as to what might, could, would, or should have happened in connection with his everyday life. My sole object has been to place him before the reader precisely as I saw him, and to jot down such things as appeared to have some little historical interest. The most memorable event I can now call to mind, in relation to Mr. Thackeray, is at the same time the most melancholy one, for it brings me to the morning of Christmas-day, 1863, when I chanced to pay a visit to Horace Mayhew, in Old Bond Street. I entered the room cheerfully,

"As fits the merry Christmas-time,"

and proffered the usual good wishes to Mayhew and another friend who was present; but I was surprised to find that my animal spirits met with no response, and that my companions were as depressed as I was inclined to be the reverse. "Haven't you heard?" said Mayhew, looking ominously blank and chop-fallen. "Heard!"

I exclaimed; "heard *what?*" "Why, about poor Thackeray?" "No; what about him?" "He's dead!" "What!" I cried, almost petrified; "*our* Thackeray, the *great* Thackeray?" "Yes," he said, "too true. William Makepeace Thackeray: he died yesterday morning, or on the previous night." This was indeed a piece of news as saddening as it was unexpected, and when it was revealed to me I was dumb with an emotion which it would have been affectation in me to endeavor to disguise. As to Horace Mayhew, he had formed an affection for Thackeray which on that occasion expressed itself in accents of the most bitter grief.

It was soon explained that the lamented writer was found dead in his bed on Christmas-eve, and that the immediate cause of his decease was an effusion of blood on the brain, brought on by one of those violent stomach afflictions to which I have already referred. I could not but remark what a deep gloom the event would cast over many an otherwise happy fireside at that festive period; and I was afterward led to the reflection that the line above quoted would now too painfully bear the second reading given to it by the author—

"As fits the solemn Christmas-tide."

The line occurs in the last stanza of a little poem called "The End of the Play," with which Mr. Thackeray's Christmas book, "Dr. Birch and his Young Friends," closes; and as its plaintive tone of farewell would seem to be especially in harmony with the author's removal from the scene, I will quote the entire verse:

"My song, save this, is little worth;
I lay the weary pen aside,
And wish for health, and love, and mirth,
As fits the solemn Christmas-tide.
As fits the holy Christmas birth,
Be this, good friends, our carol still—
Be peace on earth, be peace on earth,
To men of gentle will."

He laid the weary pen aside! If these simple but impressive words may be taken as a foreshadowing of what his feelings might be when called upon to lay it aside for the last time, we may well believe that at that sad moment his thoughts were full of prayer for the earthly peace of all.

The duty of describing in detail the funeral of Mr. Thackeray must be left to his biographer—a character which will, doubtless, ere long be assumed by one who can speak of "greatness greatly;" but as I was present on that mournful occasion I am constrained to allude to it, as affording the last link in the chain of my reminiscences of this conspicuous example of representative men.

It was on the morning of the 30th December that Thackeray was carried to his resting-place in Kensal Green Cemetery. The atmosphere was warm, crisp, and clear; the ground was unusually elastic, and there was a genial glow over the face of nature which almost forbade the idea that the hundreds who were hastening to the burial-place were absorbed by other than cheering thoughts.

"The sun shone bright o'erhead;
Nothing in Nature's aspect intimated
That a great man was dead."

The number of persons present was estimated at about 2000, and among them were many of the chosen lights of literature and art. Mr. Charles Dickens, Mr. Robert Browning, Mr. Anthony Trollope, Mr. Mark Lemon, Mr. G. H. Lewes, the historian and critic; Mr. Theodore Martin, poet and satirist; Dr. Russell, of the *Times*; Mr. Frederick Lawrence, the author of "The Life of Fielding;" Mr. Higgins (Jacob Omnium), Mr. Robert Bell, Mr. Millais, R.A., Mr. George Cruikshank, Mr. John Leech, Mr. Shirley Brooks, Mr. Horace Mayhew, Mr. Charles Mathews, Mr. Tom Taylor, Mr. Creswick, R.A., M. Louis Blanc, Mr. John Tenniel, Mr. Edmund Yates—these are a few taken almost at random from the numerous gathering of friends assembled at the cemetery; but the most noteworthy circumstance struck me as being the deep sympathy shown in the event by a very large majority who could have known nothing of Thackeray except from his works.

It was, in truth, a ceremony so full of universal interest that it will be remembered as a tribute of respect to one of the few whose genius could alone command it; and, if I might be allowed for one moment to associate the *living* Thackeray with the scene, I should remark how forcibly it brought to the recollection of many, who saw the hearse enter the grounds, the funeral of Douglas Jerrold, when the noble gray head now laid low was observed towering among the pall-bearers. Indeed the mournful proceeding brought these two great names closely together in my mind; and I am free to confess that, remembering what I had seen of the inherent kindness of each, and recognizing so many faces at Kensal Green, which, six years before, I had marked at the ceremony at Norwood, I could not but regard the coincidence as fraught with both pleasure and pain. So striking, I thought, was the similarity between the circumstances attending the two burials, that it was difficult to dispel the illusion that, although the two men were not bound together in life by the strongest ties of friendship, the same spirit of literary brotherhood which had guided their fortunes on earth seemed to hover at last over their graves.

DID SHE DREAM IT?

"IF I stand here, I saw it!" Such is the utterance of Macbeth's passionate, profound conviction that he saw, actually saw, with his own eyes, the awful shape none else could see, and the sight of which blanched his cheeks with fear. "If I stand here, I saw it," innocent, suffering Julia Challoner might have said—mentally did say—as she stood at her window, and gazed with pale face and startled, wondering, longing eyes out upon the grass and trees on which the moonlight was shining. She trembled; but not with fear, nor yet with

cold: only with excitement, wonder, bewilderment, and something almost like a feverish hope and joy. "I *did* see it!" she said to herself. "I am not dreaming, or deluding myself, or out of my senses. It was he: I saw him."

It was after midnight, and Julia had been lying in bed, not asleep but wide awake, and thinking earnestly and anxiously. The window of the room was opposite the foot of her bed; so that, as she lay awake, her eyes naturally rested on the window and the foliage which broke the rays of the moon and darkened the chamber. Her mind was much disturbed by an agitating question, such as, perhaps, no woman ever ought to have to consider.

"Shall I marry him?" That was the question; and when I say a woman never ought to have to consider such a question, I mean that the mere existence of the doubt, the mere necessity of making the inquiry and thinking over it, ought to be a decisive and prompt reply. Where there is doubt enough to ask, there ought to be no doubt of the answer. Some thought of this was in poor Julia's mind, and disturbed her conscience.

"Can I—ought I to marry him? Can I help myself? Can I avoid marrying him? I do not love him, and I never can; and he knows it. But he loves me; and he has so long been faithful and true, and he is so good—and Lionel loved him. Oh, I don't see how I can draw back—and yet I feel so tortured! If Heaven would only send me some hint or guidance! I wish I were a Roman Catholic, that I might pray to the Virgin."

She tossed on her bed, and turned her face to the wall. At that moment the room seemed to grow dark, and a cold air breathed over her, and she almost thought she heard a low, faint sound, like a sigh. She looked toward the window, and saw, or thought she saw, something which caused her to spring up in the bed and stretch out her arms; and she was about to utter a wild cry of surprise and excitement and joy, but with a strong effort she controlled herself, and was silent. She gazed at the window fixedly for some seconds; then she left the bed noiselessly, and crossed the floor, and stood at the window, and strove to follow with her eyes something that seemed to disappear as she looked. And it was then that she said to herself the words already given: "It *was* he; I saw him!"

What she saw, or thought she saw, was the figure of a young man with dark hair and bronzed cheeks, and a manly, open expression, genial despite the deep sadness that covered his face. The eyes rested on hers, and were full of love and pity and tenderness. After a few seconds the figure seemed to withdraw; and it was then that Julia rose from her bed and followed it with her eyes until it disappeared, or was lost to sight somehow, among the trees and shrubs.

One thing had, amidst all her wonder and be-

wilderment, made a clear, distinct, and predominant impression upon her mind. She was indeed convinced that she had seen something which could neither have been created nor explained by any ordinary and familiar processes of nature; but yet the face which looked on her, the eyes which gazed into hers with such tenderness unspeakable, did not show like those of the dead. Not a ghost come from the grave seemed to have stood at her window, but the spiritual *eidolon* of a living man.

"Oh, Lionel," the girl murmured, falling on her knees, and bursting into a passion of tears, "do not leave me in this fearful state of doubt! Send me some other sign! Come to me again! You are still living—I know it! Do not leave me to this distraction and misery, but make me some clear sign that I may know where you are, and if we are ever to meet again!"

That night, however, she saw nothing more; and the dawn came before she fell asleep. For she had now more than ever cause to torture herself with doubts, and to weary her mind by thinking what she must do.

But although she had slept so little she arose early and promptly. For she had promised to take a ride that day in company with her affianced lover.

The story of the engagement between Julia Challoner and Ronald Levett was somewhat strange, and had much that was painful in it. Lionel Black and Ronald Levett were first school-fellows, then college friends, then fast friends in the outer world. Both were artists—painters—but with a considerable difference in the conditions under which they practiced art. Lionel Black was poor, and meant to live by his painting; Ronald Levett was the only son of a man who had made a large fortune in trade, and was now in weakly health. Both young men were New Yorkers by birth; but there was in Levett's blood some leaven of the Cuban creole, and people said his mother had been a slave in one of the Havana hotels, and was thence bought, brought, and married by the elder Levett. However that may be, Levett the younger was that rare creature, a "swell" artist. Like the late Augustus Egg, he used to ride to his studio on a magnificent horse, with a dashing groom behind him; or set the neighborhood in commotion by clattering up there four in hand. In Paris and in Rome Levett amazed the modest circles of art by his splendid displays and his lavish expenditure. It does not take much, indeed, in the way of expense to dazzle the eyes of a Roman art-student; but Levett did certainly display a genuine Fifth Avenue prodigality of costly barbarism. Yet he and Lionel Black were as fast friends as ever. Black often laughed good-humoredly at his comrade's magnificence, but, as he did not envy it, he made no pretense of despising it. All things went on well with them until an unlucky chance made them both fall in love with the same girl. This is a sort of fatality happening to a pair of friends so oft-

en in the drama and romance that we are apt to forget that it occurs much more often still in real life.

The girl they fell in love with was a young American, who usually passed the winter with her father and mother in Rome. Julia Chalonier was her name, and she was a girl who might fairly be called beautiful; but who was especially attractive because of the exquisite simplicity, sweetness, and truthfulness of her nature, and the delicate refinement of her intellectual tastes. The two young artists were constant visitors at her father's house. "The wind and the beam loved the rose," in Lord Lytton's pretty, sentimental poem—"and the rose loved one." In this instance, the one whom the rose loved was the moneyless artist, Lionel Black.

Ronald Levett was the first to speak. He proposed for the girl, and he had to back him all the influence her father and mother could give; but Julia frankly and firmly refused to marry him—and this was the first time in his life that Ronald Levett had been refused any thing on which he had set his heart. He really loved the girl passionately; but in his disappointment there was mingled other bitterness than that of misprized love. Yet he put a good face upon the matter until it became only too evident to him that his old friend and comrade had only to ask for the love which was refused to him. Indeed, Julia's whole soul sometimes spoke out of her clear, candid eyes when she looked at Lionel Black; and Black must have been blind if he had not seen it. So he asked her one evening for her love—he had kept back, poor fellow, thus far, only because he had no money, and she put her hand in his, and pledged herself to marry him. There was a good deal of opposition on the part of Julia's father and mother; not very unreasonable from their point of view; and at last they insisted on some delay. Lionel must win his way a little before they would consent that he should have their daughter. Lionel, who was actually beginning to make his way already, and was in every sense a manly fellow, was willing to wait and prove what was in him. Indeed, he would have accepted almost any conditions which promised him Julia in the end—and so they were to wait, and were not even to be bound, meanwhile, by any thing which Julia's family would recognize as an engagement.

When Ronald Levett heard what had happened he gave way to a perfect tempest of passion. He attacked his old comrade with furious reproaches; and they might have had a fierce quarrel but that Lionel was too generous, and now too happy, not to make full allowance even for the most unreasonable expression of his friend's disappointment and frustrated love. In a few days Ronald returned to himself; became calm and reasonable; held out his hand to Lionel, and begged for a forgiveness which was cordially offered before he had time to ask explicitly for it. So the old

comrades became comrades once more; and they presently set out together to make a tour through Sicily.

This tour was the occasion of an event which created at the time a wild and painful excitement. Both the young men were missing for several days from Palermo. At last Ronald dragged himself one day back to the hotel. He was wasted, haggard, exhausted, and with a gunshot wound in the left arm. His story was shocking. Black and he had wandered too far into the mountain region, and were attacked by brigands. The comrades had revolvers, and foolishly used them in a futile resistance. Levett received a wound in the arm—Black received several wounds. They were dragged away, faint and bleeding. The brigands proposed to send one of them back to Palermo to obtain ransom for both; but before any arrangement could be made poor Lionel died. Levett was so much broken down by his wound, and by his horror and agony at the death of his friend, that he fell into a senseless state, and lay on the earth like a corpse. He assumed that the brigands looked on him as a dying man, and gave up any idea of recovering the ransom on which they had originally fixed. So they were content with plundering him of all the money he had—a considerable sum—and his watch and rings; and they left him, doubtless in the belief that they were leaving him to die. But he recovered his consciousness, and found himself alone. What had become of the body of his hapless friend he did not know; but he assumed that the robbers must have flung it, to find a grave, down one of the precipices of the mountain. All that Ronald Levett knew was that he saw his friend die; that he himself became unconscious; that when he recovered he found himself plundered of every thing valuable—and alone.

He dragged his wounded body and sad spirit back somehow, in weary marches, to Palermo, where his story created an appalling sensation. Troops were sent out to scour the country every where in the hope of capturing the brigands, or even recovering the body of poor Lionel Black. The brigands were not captured; the body was not found. After a while the public mind lost its excitement; the sensation passed away; and the poor young American artist, who had perished so miserably, was forgotten.

Not forgotten by all. The friend who was by his side when he fell, the girl whom he loved—these did not forget him. Nothing could be more profound than the effect which the calamity seemed to have produced on Ronald Levett. His grief was made the more bitter by the fact, which he never failed to tell with stern self-reproach, that it was he who had suggested the fatal excursion to the mountains. His grief touched even the almost broken heart of Julia; and a common sorrow drew them much together.

For her all the brightness and color and

hope were gone out of her life. She seldom talked much about her grief to her father, or even her mother; for she was painfully conscious that they had never favored her love, or looked on poor Lionel even with eyes of toleration. There was, in fact, no one now on earth in whose society she found any thing consoling or sympathetic, save Ronald Levett alone. His manner was always so tender and soothing, his tones and words spoke so profound a sympathy, his grief for his lost friend was so earnest, that Julia's heart opened and softened to him. She seldom spoke of Lionel to any one but Ronald; but they two talked long and often of the youth who was gone. So it came that, after they had returned to New York, and Julia was in her father's house on Staten Island, Ronald at last ventured to revive the memory of his own love-suit; and gently, delicately pressing it again and again, succeeded in drawing from Julia a promise that she would yet become his wife.

It was in the stress of her doubts and agonies, after the promise had been given, that Julia, lying awake in her room, saw one night, or thought she saw, the sight that has been described.

She did not breathe a word of what she had seen to any one. But when riding with her now accepted lover next day, she suddenly said:

"Ronald, I have promised you that I will marry you. But that is because we believe poor Lionel to be dead."

"Believe it, dearest! Do we not know it?"

"Is it impossible, quite impossible, that he should be alive?"

"Julia, how can you ask such a question of me? Do you think I would have left him if there was any chance of saving him? I saw poor Lionel die."

The tears rushed into Julia's eyes, and she said no more.

That night she dreamed of Lionel—dreamed that she saw him alive in the midst of a group of bandits. The dream was so vivid, and her excitement became so great, that she screamed, and awoke at the sound; and when she opened her eyes the same scene, the same forms appeared—faint, indeed, and shadowy, but still distinct between her and the window. Yes, there it was; that was Lionel's form. He was alone among a brigand group. She saw all this distinctly for a moment, and then it was gone.

This kind of visitation, or dream, or whatever it might have been, seemed to have taken possession of the girl's senses and being with the return of every night.

One morning she flung herself upon her knees before her father, and implored him, in a wild outburst of tears, to take her to Sicily, that they might try to find Lionel—to take her there at once, if he would save her life or her reason.

"Father, he is not dead! He is alive! I know it! I have seen him! If we do not seek him out, I shall die—or go mad!"

Mr. Challoner had nothing of the stern pa-

rent of the drama about him. He would have gone round the world a dozen times to relieve his daughter's sorrow. And although he had no faith whatever in her supernatural admonitions, he had sense enough to see that for her sake, at least, they must be obeyed as promptly and strictly as if their genuineness were certain. Mrs. Challoner was a little vexed; but, perhaps, in her heart, was more inclined to attach importance to her daughter's nightly visitations than her husband. At all events, they would sail for Europe at once; and nothing that money, perseverance, and patience could do should be left undone to arrive at some certain knowledge of Lionel Black's fate.

But was it not certain? Had not his dearest friend seen him die? That was the thought which racked poor Julia's breast as she lay awake on her bed the night of the day when she had induced her father to promise that he would take her to Sicily. How could Lionel be alive? Ronald Levett had seen him die. Were her spiritual warnings only delusive dreams?

Even as she tortured herself with this question, an unaccountable inclination to sleep seemed to come over her. She sank away into a dreamy, almost unconscious state, and in a moment the now familiar group was before her again. But this time Lionel seemed to be earnestly arguing with his captors; and she thought she heard his voice, faint, distant, but distinct. What words did she seem to hear in her dreaming ears?

"I tell you it is true" (the words were in Italian); "he *will* return. Something has interposed to keep him back; but he will come with the ransom. He is my dearest friend. Do you think he would desert me? Kill me, if you will; I can not help myself, and I am not afraid to die. But you will only lose the ransom. For Ronald Levett will come back for me, unless he, too, is dead; and, unless he died before he reached Palermo, some one sent by him will come for me."

She started up; and lo! there still was the scene before her, and the words distinctly sounded once more in her ears. And she gave a wild, agonized scream, which rang through the house, and before many seconds had passed her alarmed parents were beside her. But she did not tell them what new conviction had filled her soul. That she kept to herself, with an inflexible purpose which she was soon to fulfill.

Next morning came Ronald, and she saw him alone. He began by a gentle, tender remonstrance against the useless enterprise of the journey to Sicily. She listened to him calmly, and then said:

"Ronald Levett, do you know why I am resolved to go to Sicily?"

"No, dearest; I can not understand it. Of course I sympathize with your feelings—"

"Hush! Not a word more of that from your lips! I am going to Sicily to seek for

the friend whom you deliberately abandoned to the brigands, falsely declaring that you saw him die—you, who had only been set at liberty in order that you might return with the ransom for both!"

"He has come back!" exclaimed Levett, wildly. And he sprang to his feet, a ghastly pallor on his face. "He is alive, and has come back, after all—and told you this!"

Then the wretched man fell on his knees before the girl, and made a full confession. He and Lionel had been captured by the brigands; they had used their revolvers; he had been wounded, and he alone; the brigands had released him, that he might raise the ransom for which they stipulated, and had selected him as the envoy, because of his wound, which would have made him at once the more troublesome and less valuable hostage. When he found himself free, the fearful temptation came on him—the temptation to rid himself forever of a rival by merely leaving Lionel in the hands of men who would surely kill him the moment they found that the ransom was hopeless. He yielded to the temptation; and since that hour he declared that life had been to him a perpetual agony, a constant present hell. Groveling in the abasement of utter remorse, he begged to be allowed to devote himself, his fortune, his life, to the rescue of Lionel, should Lionel still be alive—provided only that Julia would consent not to expose his guilt, and would entreat of Lionel to forgive him.

His assistance was accepted so far that Julia received from him, and carefully noted down, every particular which could be of service in seeking Lionel. It was, for instance, of the uttermost importance to know what were the channels of underground communication by means of which negotiations were to be opened with the brigands, and the ransom conveyed. Every one knows that in all the large towns of Sicily and Naples there are such channels of communication with brigandage. The

whole business is very systematic in its arrangements, and its secrets are kept with a marvelous fidelity.

Strange as it may seem, Lionel Black was still alive, after a whole year of wandering and captivity with his brigand jailers. More than once they had nearly lost patience, and many of the band were for killing him; but, of course, while there was the faintest chance of their obtaining the ransom, his life was worth preserving; and his manly, fearless, truthful nature had won much of their confidence. So they kept him alive for a whole year, and at last they got their ransom; and there entered Palermo, one day, a ragged, thin, bearded, sun-browned man, who was soon known to be the American artist so long believed to be dead. And it may be doubted whether the whole long history of love contains the story of a meeting more wild, more rapturous, than that between Julia Challoner and the lover who seemed to have come back to her from the dead.

Ronald Levett's hideous secret was concealed as well as might be. The world understood that he had been deceived when he supposed that his friend had received a death-wound in the encounter with the brigands. The rest of his story, as he originally told it, was allowed to remain unchallenged.

But Lionel and Julia, now married, will not live in New York while *he* lives there. They are in Rome; and Lionel is likely to make a name in art. Julia has no more supernatural visitations; but the skeptic would find it hard indeed to convince her or her husband that her visions were but the offspring of a mind unhinged by passionate grief, and by a secret, half-conscious, inexpressible, ever-present suspicion of Ronald Levett's truth. She believes that Heaven sent her a special and supernatural intimation of her lover's existence, and of the purpose to betray him; and I do not know why any one should wish to reason her out of her belief.

ANTEROS.

BY THE AUTHOR OF "GUY LIVINGSTONE," "SWORD AND GOWN," "SANS MERCI,"
"BREAKING A BUTTERFLY," ETC.

CHAPTER XIII.

"**B**ELIEVE that this is kindly meant, though it bears no signature. It is your purpose, I hear, to make Lena Shafton your wife; and probably you care little whether your choice seems to the world wise or unwise; but has it occurred to you that there might be other obstacles to your future happiness besides the inequality of age? You are too brave and honest to play the complaisant husband, and, stout as your heart is, it would scarcely bear up under dishonor, or even the suspicion of dishonor. I bring no direct accusation against

your affianced; it may be she is innocent, in intent as well as in deed; but a woman who will not speak truth before marriage is seldom to be trusted after. I advise you, at least, to test her so far: ask her two simple questions. What was the cause of her sudden departure from town in the season that she wots of, and of her having lived in retirement ever since? Next—How long is it since she saw or heard from Caryl Glynne? If she can answer these questions quite frankly, it will be the better for you both; if she can not, or will not, other channels of information are open to you; even the gossips of the club might throw some light

upon the matter. You can slight this counsel, if you choose; only never in after-time complain that you were not warned."

This letter, on the day after it reached him, Lord Atherstone had placed in the hands of his betrothed without a word of comment; and he stood watching her now, while she read it through earnestly—not suspiciously. It would have been somewhat difficult to guess, from Lena's countenance, at the nature of her emotion. Her cheek flushed at first, but plainly rather in anger than confusion or fear; but as she read on she waxed pale again, and a kind of weary, resigned look came over her face, like that of one on whom some old annoyance returns not unexpectedly. When she had quite finished, she dropped the letter on her knees, and looked up at her lover, saying,

"I am ready—quite ready—to answer."

"To answer—what?"

Her brows contracted at once. She thought beating about the bush singularly ill-timed here, and rather unworthy of the speaker.

"The questions suggested here, of course. What else could I refer to?"

"I am in the dark still," he said, quietly. "I read as far as the line in which your name appears—no further. I flung the letter aside then, and I would have burned it on the instant if Marian Ashleigh—she was the only person present—had not insisted that it ought to be shown to you."

With much of self-reliance, Ralph had little self-conceit, and he would have been surprised, as well as proud, if he had guessed how much nearer these few words brought him to the one wish and object of his heart. Lena's head had been raised haughtily enough till now; but it sank almost to her breast as she murmured:

"Is it possible? Could you trust me so?"

He drew close to her side, and stood silent for some seconds, smoothing, so lightly that she scarcely felt the touch, the folds of her braided hair.

"My dear," he said at last, "did you think it was a pretty speech when I told you that I would never doubt till you bade me do so? You may have your fill of compliments wherever you go, but you will have to be content with plain truths at home, I am afraid; and this was one of them. Will you believe if I repeat it over again in sober seriousness?"

Her hand stole upward, and, for the very first time since their betrothal, sought his of its own accord; but her head was bowed still.

"Yes, I believe; only I wish I were worthier. But I can be frank now, at all events; and you must listen, even if you dislike it."

Then taking up the letter from where it lay on her lap, she read it out aloud, from the first to the last word, in a low, even tone. While she did this she felt his grasp tighten round her fingers; and when it was done, looking up into his face, she saw that it was dark with passion—so dark that the heart of many women would have sunk within them, even had they felt as-

sured that the menace was not leveled at themselves. But Miss Shafton felt neither fear nor misgiving; her smile, though somewhat deprecating, was meant rather to bespeak patience than forbearance; and the next instant her lip was curling scornfully.

"I am not quite clear about the kindly meaning," she said; "but there is truth enough to make a fair libel, and the questions are only such as you might have pressed—not ungenerously or unjustly—ten days ago. I almost wish you had pressed them; however, it is not quite too late now. You have just heard the name of the one person for whom I ever cared. It was because I cared so much that mother carried me away to the North at a minute's warning. She utterly disapproved of our intimacy, and thought that it was broken off then and there; indeed there never was any real engagement; but, while it was possible that I could marry Caryl Glynne, I was not free to listen to any other man; and I never wished to be free. I have believed it impossible for a long, long time; but I never knew it, absolutely, till a few hours before I accepted you. I saw him that morning, and said "good-by." There is no mystery about our quiet life for these few years past. Mother will tell you that we have been too poor—much too poor—to afford a house or lodgings of our own in town; and my aunt, with whom we used to stay in those days, has never seen fit to invite us since. She was awfully angry with me for my folly, I believe, and took this way of showing that she did not mean to abet it. I would have told you all this before, if you had asked me—indeed I would; but if, after having heard it, you choose that we should henceforth be no more than friends, I shall always think of you gratefully; and you will do as much for me?"

She would have drawn her hand away; but he held it fast; and before he opened his lips Lena knew how he had decided—knew that, whether for weal or woe, her destiny remained unchanged.

"Friends?" Ralph answered, rather hoarsely. "Yes, always that, I trust; such friends as husband and wife should be. Providence works with queer instruments, they say; but a better deed has not often been wrought by base hands than has been done here. If I could get over the insolence, I could almost thank the informer. My dear, I felt very proud and happy when I took your troth; but you have made me much prouder and happier to-day. So proud and so happy that I can't even think it a miracle that you should have looked on my face without dislike, with that other one fresh in your memory; for I know that face well—well enough to fancy its haunting women to whom Caryl Glynne's name is strange."

Her color had been less steady than her voice throughout; but it flickered painfully just then; yet her countenance lighted up withal, like that of one who, possessing some rare and precious thing, hears it valued at its worth.

"One does not easily forget a good picture," she said, after a minute's pause, with a very fair composure; "and there is no sort of reason why this one should be turned to the wall. You might have been amused if you had watched our adieux that morning; they were so thoroughly cool and business-like. It is bad policy, I think, as a rule, to drop one's old acquaintances without strong reasons; but if you wish this name scratched from my visiting-list, you have only to say so. I shall make no objection, and I am very sure Mr. Glynne will not complain."

There was a tinge of bitterness perhaps in the last words; but Lord Atherstone did not notice this.

"One never knows what will happen," he said, with his short, deep laugh; "but I feel pretty safe against absurd jealous fits just now. I am not likely to meddle with your visiting-list, my dear. In this, and in other things, if you please yourself, it is next to certain that you please me. Now, don't you think you had better make ashes of that well-meaning letter at once?"

"No, I don't think so," Lena answered, deliberately. "It is worth keeping, if it is only to remind me—supposing I am ungrateful enough to forget it—how you would have trusted me blindfold. You let me have my way."

Of course he let her have it. The rest of their interview was comfortably commonplace; and it lasted till Lord Atherstone had only just time to send off this note to Templestowe:

"MY DEAR MARIAN,—You will be glad to hear that I followed your advice religiously, and more glad still to hear that Lena, after reading the letter out to me, insisted—for I should never have pressed her—on answering certain questions it contained. What those questions were, or how she answered them, concerns no one but ourselves; but I should like you—you only—to know that, if it were possible, I have better reason to-day than yesterday to rest on her truth and honor. She does not know that I am writing, otherwise she would thank you, perhaps not less heartily than I do, for your sound counsel.

"Affectionately yours, ATHERSTONE."

Not one of these simple words had a second intention or shade of sarcasm. Nevertheless, judging from the expression of Marian Ashleigh's countenance as she read, you would have guessed that in every one there was a sting. Yet she had acted from the best of motives, of course; and verily she had her reward.

Ay! and so had that traitor of old time, down whose throat the full price of treason was poured in the guise of molten gold.

CHAPTER XIV.

THE head of her family had in due course been made aware of Lena's engagement; and, though he had not been consulted beforehand, had been good enough to signify his approval thereof. In this same week Miles came up to town for the express purpose of being presented to his future brother-in-law. It seemed to

Mrs. Shafton that the meeting could not decorously be deferred; and yet, from the bottom of her heart, she wished it well over. Lord Atherstone was by no means a polished diamond; but he was thorough-bred even in his *sauvagerie*, and was about the last man living to appreciate or overlook slang or swagger. That Miles had a way of "putting side on"—to use his own vernacular—in and out of season, his mother could not deny. However, her fears for the nonce, at least, proved groundless. Certain instincts of race still survived in this unlucky spendthrift, and in spite of his inveterate horsiness—Lacon, the steeple-chase crack, was his model of manner as well as his glass of fashion—he did occasionally contrive to remember that he had been born, if not bred, a gentleman. Furthermore, howsoever much the British subaltern may ignore his own duties, or sneer at the service, he has a tendency, you will find, as a rule, to speak with somewhat "bated breath" in the presence of any famous veteran. Traveling in company with the Archbishop of Heligoland, Lieutenant Famish will select his hugest *puro*, and smile serenely through the smoke-wreaths at the wrathful protest of the Right Reverend Father in God; but if Sir Hector M'Murdo be his fellow-passenger, the same ingenuous youth will certainly consult that truculent warrior before he presumes to dally with a delicate cigarette.

On the present occasion Miles Shafton bore himself with a singular modesty, savoring indeed of shyness. His brief speech of congratulation, though evidently prepared beforehand, was barely intelligible; and he was very silent after that till just at last, when he warmed up into something like eloquence to acknowledge Lord Atherstone's offer of mounts later in the season, if Miles would be their guest at Templestowe. On the whole, the interview was satisfactory to all parties concerned; and to this effect Shafton expressed himself the following night, while consuming a succession of "last pipes" in his barrack-room with a special confidant:

"He's the right sort, I can tell you, Frank: as hard as nails, and as tough as pin-wire; with an eye like a game-cock's; and he rides the right sort of cattle too, I lay odds; none of the snaffle-bridle lumber that want kicking and hoisting at every fence, and do a brook at twice; but stuff that go bang up to their bit, and catch hold of it too sometimes, and go at a bull-finch as if they would eat it, and jump just as far as they can, and gallop all they know. And his are bound to be two stone over my weight, that's one comfort. See if I don't take the change out of some of 'em before March."

"I should have thought you'd got pretty well enough of your own," the other remarked, "without wanting the run of another stable."

"Well, I've got eight besides the chasers, which don't count; but there's always something amiss with more than half of 'em. D'you think Paston poisons them? I shouldn't won-

der; he crabs every animal he's not had the buying of directly it comes in; he's clever enough for any thing, and robber too, for the matter of that."

"Why the deuce don't you shunt him, and have done with him, instead of always black-guarding him behind his back? You're a bit afraid of him, I do believe."

"No, I ain't afraid," Miles said, simply; "but I can't afford to quarrel just yet. I couldn't well shunt him without paying him, you know. I keep on stopping his mouth with tenners on account; but I haven't had the pluck to look at his book these three months. If it wasn't for 'backin' 'osses' like the rest of us, what a pot of money he'd be worth! I don't believe I often make a deal without some stuff sticking to his fingers. Now, if I went to stop at Templestowe, I'd send up a good big draft to the Corner, and I'd get enough ready that way to settle with Paston and leave something in hand; and I'd stick in below the advertisement that 'the gentleman can thoroughly recommend his stud-groom,' and so make a clean sweep of the lot. That would be a coo, wouldn't it?"

"Well, it would," Frank Daker assented; "and looking at it in that light, I don't think Templestowe would be half a bad put-up for you. I believe you do occasionally get on grass in those parts, if you don't mind long meets; and some of those clay-countries carry a rare scent. It's natural that you should be pretty full on your brother-in-law. But—but I wonder how Miss Shafton likes it. The baron's a long way past mark of mouth, isn't he?"

Though late hours and drink and devilry of all kinds had worked havoc with Miles Shafton's big brown eyes, they were still sometimes very like Lena's, especially when, as now, they opened wide in wonderment or anger.

"Like it?" he said, rather sulkily. "Likes it of all things, of course. Why the deuce shouldn't she? To hear you talk one would think in these matters there was weight for age; besides, she ought to know her own mind by this time. What makes you doubt it?"

"Nothing in particular," Daker answered, sending out a long trail of smoke, "only it's just possible she might have liked some one else. She must have had plenty of chances, any how, with that figure and face. You'd have to go among the plain-headed ones, I'd reckon, if you want to find them 'fancy-free,' as the poet has it."

Shafton scowled at the speaker. He could knit his brows—felly enough sometimes—this careless, shiftless prodigal.

"Poets be d—d," he muttered. "Why can't you speak out like a man? You've heard some of those cursed stories about her and Caryl Glynne, I suppose; as if there ever *could* have been any thing in it! Is it likely that we'd have ever let her think seriously of such a duffer as that?"

The dignity of the "we" was superb, con-

sidering that Miles, at the time alluded to, was a tailless "infant" with rather less voice in the family councils than his mother's waiting-maid. Daker saw and relished the absurdity; though passably illiterate, he was gifted with a brisk mother-whip and a tenacious memory; and albeit his troop-accounts were to him a burden and a snare, he could under certain circumstances put two and two together as well as his neighbors. There having been "any thing in it" did not strike him as so wildly improbable. Moreover, he was aware that Miles had certain small social ambition independent of the stable, and would have given half his yearly pay to be allowed to stroll thrice through the Row arm in arm with the "duffer" in question—the other half for the privilege of calling Glynne in public by his Christian name; but all things go by comparison. By the side of Shafton, hampered and encumbered as he was, Daker was still virtually a pauper; and though he never plundered his comrade directly or indirectly, the other was useful to him in various ways; in his turn Frank felt that he could not afford to quarrel, especially about a matter in which he had no personal concern. Lastly, though an outsider perhaps would hardly think so, there *are* limits even to mess chaff.

"You did quite right, Buster," he said, with perfect gravity (this had been the other's sobriquet ever since he joined); "such a thing couldn't be stood, at any price. Mine was only a shot at random, and—here's wishing all luck to you and yours. You'll get a week's extra leave out of this business, any how, and that's something to the good, in these hard times. You know that there's an early field-day in orders for to-morrow? Our old man's gone cracked about this new squadron-drill. He'll never rest till he's lamed half the troopers, and worn the flesh off our bones. Now I'm off to roost—good-night."

Miles returned the salutation very ungraciously. Willful and impatient of contradiction to a degree, and occasionally liable to violent outbreaks of passion, he was seldom sullen—still more seldom suspicious; but when once fairly roused, neither his discontent nor his misgivings were speedily appeased. It was quite true that he counted his sister's fancy for Glynne among the things utterly passed and gone; nevertheless, Daker's hint dove-tailed so accurately with certain other doubts lurking in his own mind that he fell a-thinking now.

He remembered that, when he saw Lena alone, before his meeting with Lord Atherstone, if she did not look like a martyr, she looked still less like a triumphant bride elect; and that once only she had smiled: this was when he told her how pleased he was with the match, and she answered,

"You ought to be."

What did she mean by that? Was it possible that, by selling herself, she hoped to help him out of his scrapes? Not a very new way of paying old debts; but he felt—at all events,

for the moment—as if he would a hundred times rather face the duns and difficulty and disaster in his own way than evade them in this fashion. Great and good men have consented—reluctantly, but still they have consented—to escape out of prison by a feminine stratagem, leaving wife or sister or mistress behind them in ward to abide the consequence. In like strait, prayers and tears would have been wasted on Miles Shafton. He would have cast off the pleader somewhat roughly, grumbling out good-by as he thrust her from the cell, and then, taking no sort of credit for self-sacrifice, would have waited doggedly, if not serenely, the coming of the doomster. “Not a bad devil at bottom,” as said his few apologists. Did it ever strike any of them that, if in earlier days he had fallen under guidance strong, wise, and gentle, he need not necessarily have turned out a “devil?” When in the pursuit of his fancy, he recked no more of the interests he imperiled than the Wild Huntsman did of the corn he trampled under hoof; but in his sober moments he was not wholly selfish, and could be lavish of things more precious than coin, and, in his ill-regulated, irrational manner, he certainly loved his sister. The possibility floated before him now of sending all his live and dead stock into the market; of exchange into a sedate, beetle-crushing corps; of detachment duty in some wilderness where foxes are shot down as vermin, and shilling-whist considered a dissipation; of foreign service on some station with no game bigger than a jackal to shoot or spear; and these visions were very dreary; yet the worst of them was pleasanter than that of Lena standing before the altar with her face white and set. It was not too late yet; he would go up to town again tomorrow and have it out with her—he would—and to his determination he added an oath.

At this point in his reverie the ill-used pipe-clay crumbled betwixt his strong, sharp teeth, and the *brûle-gueule* pitched forward against the fender, snapping short off at the bowl. It was an old favorite, and not a light loss, as we all know; nevertheless, Miles felt rather glad of an excuse for giving vent to his spleen and breaking off his meditations, as he leaped up with a curse, and ground the fragments to dust under his spurred heel. Then, after driving another “nail”—a long and heavy-headed one—he betook himself to bed, and in five minutes had growled himself to sleep.

But things looked much rosier on the morrow. The field-day was short and brilliant, and the chief, albeit in fault-finding humor, was fain to admit that Lieutenant Shafton, in his captain's absence, had led his troop very creditably. Directly after stables, a dealer, long-suffering in point of payment, brought over a five-year-old that even the captious Paston allowed “had rare bones, and looked very promising.” The trial, and subsequent purchase, took up all the afternoon; and that same evening brought Miles an invitation to a big coun-

try house, famed for its covers and its claret; and so the time of grace—if there ever was such time—passed by, and any chance of explanation with Lena was lost. Had he carried out his first intention, he might have had the barren satisfaction of reflecting that he had done his duty—nothing more.

If the journey on which Lena Shafton was embarking was fraught with danger, she started at least with open eyes, after duly counting all the cost. Nor would she have paused or turned aside now for any omen or warning. Was it likely that the woman who, if she could not quell, had so smothered the beating of her own heart that Caryl Glynne had gone forth from her presence never witting thereof, would, now that the chords were fairly stilled, awake them again at the bidding of Miles Shafton?

CHAPTER XV.

ALBEIT his philosophy was rather practical than proverbial, and he knew naught of the Cabala, the sweet Singer of Israel sometimes approved himself wiser than the Sage who sprang from his loins. Take the episode of Bathsheba's child; it was the first-fruit of the simple love sealed with the blood of betrayed Uriah; yet, nevertheless—alas! perchance *therefore*—more precious in the father's sight than the fairest son born to him in Salem. For six weary days and nights he lay prone and fasting, wrestling with the Avenger in prayer, if the decree gone forth against the frail life might yet be annulled. But when the servants, in fear and quaking, told him that the end was come, the king “arose from the earth, and washed, and anointed himself, and changed his apparel, and came into the house of the Lord, and worshiped; then he came to his own house; and when he required, they set bread before him, and he did eat.”

Many centuries have passed since David set us that brave ensample, and still they be few who seem to realize that over what may not be redeemed repentance befits us—not repining; ay! and that it is as vain to make moan over our ruined hopes as over our buried darlings.

The rule holds good in trivial matters not less than in grave; therefore I think Marian Ashleigh deserves some credit for the manner in which she bore herself during the brief interval between the incidents chronicled above and Lord Atherstone's marriage. She “had drawn a good bow at Hastings,” and if her shafts had hitherto spent themselves to little purpose, she was not therefore tempted to break up her artillery, but rather set about to replenish her quiver, waiting till the convenient season should come for voiding it once more. In plain word, she made no further effort to check or change the course of events, but stood watching it as placidly, if not complacently, as the miller watches the brook that sooner or later will turn his wheel. Moreover, she tried, not unsuccess-

fully, to make her husband decently amenable—amiability in Philip being out of the question.

Now when the match is entirely to the mind, not only of the contracting parties but of all ever so remotely concerned therein, the making acquaintance with new relatives is rather a trial of temper and nerve. If the trotting out be performed ever so unobtrusively, it is difficult to get rid of the impression that stock is being taken of our moral and physical soundness; and while this lasts the most simple and benevolent people appear disagreeable, judicial, and inquisitive. There is a good deal of fancy about it, of course; but as the same applies to most mortal pains and pleasures, this does not help the patient materially. You have heard of a tyrannical schoolmistress who, on each of her birthdays, used to be endowed with a gift more or less costly, which, by a fearful fiction, was supposed to be a voluntary testimonial from her grateful pupils? If you can imagine the feelings and demeanor of the scholar who, by virtue of seniority, was compelled to pronounce the presentation address, you will form a tolerable idea of Mr. Ashleigh's on the occasion of his first interview with Lena Shafton. Lord Atherstone was present, and this in itself would have prevented any overt demonstration of dislike or discourtesy; but the tone of Philip's jerky commonplaces—to say nothing of the fidgetiness of his manner—showed plainly how the position galled and irked him. Marian's talent, before alluded to, of making rough places smooth, came in conveniently here; without attempting to hold the thread of the conversation, she contrived to fill up the gaps before they became awkwardly apparent; and, without forcing familiarity, was as genial as even Lord Atherstone could desire. And herein she was ably seconded by Mrs. Shafton; this good lady's discourse was not especially wise or witty; after chatting with her for an hour or so people went away with a vague impression of her cleverness, yet probably not a single sentence that she had uttered dwelt upon their memory; however, her small talk made very fair padding, and on this, as on many other, occasions answered its purpose admirably. Lena was perfectly cordial, but not at all fluttered or eager; indeed it was not to her a very terrible ordeal. She had not felt particularly anxious before the interview, and the result neither elated nor disappointed her. She thought it would be pleasant for all parties if the Ashleighs took her marriage in good part, and was willing to conciliate; but not to sue humbly for their favor; if it was granted, she would be reasonably grateful; if it was withheld, she would not be rancorous. Philip Ashleigh she fathomed at once; she was just as likely to make friends with a barrel-organ as ever to sympathize with his set speeches and querulous egotism; but her nerves were not very irritable, and if he would confine himself to being passively obnoxious she would be satisfied. With his wife she was decidedly prepossessed.

Marian's brisk, downright way contrasted agreeably with Philip's prim mannerisms. It looked natural, at all events, if it was not absolutely sincere; and Lena, though she had been somewhat of a recluse of late, was no country-bred simpleton. She was well content to accept any amicable advances in the shape of fair currency, without insisting on their being paid in standard gold. Somehow, it did not seem likely that she would ever find herself exchanging confidences with Marian Ashleigh; but that they might be very good friends was by no means improbable; and she desired to do her own part toward bringing about such a state of things.

Of all who assisted at that interview, Lord Atherstone was infinitely the most gratified. To Philip's good or bad behavior he was utterly indifferent. For years past he had treated his son's tempers with the contemptuous indulgence that most men extend to feeble, fractious children; but, with Marian, he was more than pleased. When he put her into his carriage he simply said, "Thank you," and kissed her; but the kiss was warmer than he had ever yet bestowed on her, and the thanks came from the depth of his heart.

And Marian received both with the meek consciousness of one who has well performed a not unpleasant duty. But you would have been rather edified if you could have followed the current of her thoughts as she drove away alone, after setting down Philip at his club.

She frowned more than once, rather thoughtfully than angrily; and in her eyes there was an anxious, far-seeing look, reminding you of a skillful pilot, who, peering into the night, finds no rift in the blackness ahead, save such as ever and anon are cloven by the lightning. She had mused so for many minutes before her lips parted, and then only this murmur escaped them:

"It will be harder—much harder—than I thought."

A short and simple word, that it, yet sometimes scarcely to be expounded by long pages of commentary, and the turning-point of sad, simple stories.

Thenceforward the needful preparations went on apace. In the settlements there could be no hitch or difficulty, as they were all on one side; and the tradesfolk, who would have taken their time in executing orders issuing from Blytheswold, even if they had not looked at them doubtfully, worked with a will for the *châtelaine* expectant of Templestowe. Mrs. Shafton's frame of mind during these days was naturally jubilant; and, to complete her contentment, there was a lull in Miles's demand for ready money. Curiously enough, some of the dew of good luck, which had lately descended on his family, moistened the fleece of this wandering bell-wether. For a wonder, one of his steeple-chase "cracks" did actually win when he had backed it—at a remunerative price too; and the successful plunge, though it was the merest sop to the

bandogs, checked their baying for a while and gave their quarry breathing space.

But on the very day before the wedding a change came over Mrs. Shafton, and her spirits seemed to droop unaccountably. Her energies had been sharply taxed of late, it is true, but this did not explain it. Work—work much more wearisome and thankless than this—had become a second nature to her, till now in the bread of absolute idleness she found little savor. Assuredly, a season like the present, when a few hours more must change daughter from maid to matron, to most women who are not social machines, brings certain spasms of anxiety; but if you had watched Mrs. Shafton narrowly, you would scarcely have imputed the distraction of her manner to mere maternal instinct; it looked much more as if she had a burden on her mind of which she would fain be relieved.

Throughout that day she had not a single chance of speaking alone to Lena; and Miles, who came to dinner, did not leave them till close on midnight. Then—always with that same restlessness in her eyes—Mrs. Shafton followed her daughter to her sleeping-chamber.

“Julia will have hard work to-morrow, darling,” she observed; “won’t you send her to bed? I will be your maid to-night. Don’t you remember, when you were little you used to make a great treat of my brushing out your hair? Let us see if I have forgotten the art.”

Lena had let others have their way in all things of late, and she acquiesced now at once, though not overeagerly. It seemed as though she would rather have avoided than invited a confidential chat just then; however, when she had made ready for the ceremony, she came and sat down dutifully on a stool, leaning back against her mother’s knee; and so for several minutes there was silence, while the slender white hands waved so deftly and tenderly through and over the shining brown tresses that sometimes well-nigh buried them. At last Mrs. Shafton spoke, low and tremulously—

“My darling, are you sure, quite sure, that you are happy? I can’t sleep to-night unless I hear you say so; and yet, do not say it if it is not true. If I could only hear you laugh just once again, in the old, merry way—shall I ever?”

Lena started slightly, but she never turned her head, and her great pensive eyes gazed always steadfastly into the heart of the fire.

“It tires one to laugh, I think,” she answered, “when one has become sage and staid; and yet, those laugh who win, they say; so we ought to be merry just now. Oh yes, I am happy—happy enough for all practical purposes. But, mother dear, if it were otherwise, don’t you think it is rather too late to put such trying questions?”

The white hands ceased waving, and Isabel Shafton’s head bent lower and lower till her brow almost touched that other head that rested on her knee.

“Late—too late!” she murmured. “Why, for three days past these words have been haunting me like a rhyme. I thwarted your inclinations once, and perhaps I have half forced them now. Ah, yes! it is easy to force without commanding. If I have done wrong I think God will forgive me, for he knows I meant to do right; but—but will you?”

And then she fairly broke down.

They may lie very close together, and their bitter waters flow often in the same channel, yet in most human hearts the fount of sorrow and the fount of tears are twain, not one. Be sure that some of the mourners of old time found it easier to cast dust upon their heads and to rend their garments and to cut themselves with knives and lancets than to evince those other outward signs of woe. During that awful vigil when, sitting in sackcloth on the hill of Gibeon, she watched her dead till the harvest-moon waned, it is not written that Rizpah, the daughter of Aiah, wept.

As a girl Isabel Shafton had to struggle hard before she could wed according to her will; as a wife she had to suffer as only a proud, passionate nature can suffer, seeing others win smiles and soft whispers when she could only win frowns and words harsh sometimes even to cruelty; as a widow she had seen the husband, whom, in spite of all his faults she loved very dearly, brought home a corpse, stiff and thrawn; but pleading, jealousy, terror, or desolation had almost always left this woman dry-eyed.

So this outbreak startled quite as much as it pained Lena.

“Don’t fret, dear,” she said; and as she spoke she wound her arm close round her mother’s neck. “Indeed, I didn’t mean it as a taunt. I would not go back if I could. You did quite right—then and now. Whatever happen I shall always think so; and do you think so too. And nothing will happen but good, I do believe. Every day I feel safer with Lord Atherstone; and it is so pleasant to feel safe—at last. Now I’m going to send you off to your beauty-sleep. I mean you to look your very brightest to-morrow.”

As may be imagined, Mrs. Shafton was not hard to convince and console.

It was a very sober wedding, only a few kinsfolk and near friends being present, including Philip and Marian Ashleigh; and—as Lord Lothaire observed, when *semiamustus* he escaped from the confines of a divorce-court—“every body behaved beautifully.” There was little more fuss when the new-married couple departed than if they had been starting on an ordinary journey; nor, though a sufficiency of good wishes followed them, was there any thing tragic in the farewells. By Lena’s own wish her brief season of seclusion was to be spent at Templestowe.

To the general good conduct of all parties concerned the weather did certainly form an exception. The discourteous sun did not vouchsafe the palest apology for a ray, and the day’s

humor waxed worse as it grew older, till, toward evening, the air was laden with storm. The strong-spirited cattle that were to carry the new mistress of Templestowe to her home drooped their heads and shivered, as they waited under the lee of the station for the laggard train; and, more than once during the brief journey, hand and spur were both needed to keep the leaders straight against the blinding rain-swirls. There was threat, rather than welcome, in the voice of the swaying elms, as the carriage swept up the avenue; and the bride had scarce set her foot over the threshold when the great door crushed to behind her with a clang that echoed through the hall from pavement to roof-tree.

Lena was not very superstitious, but she had been bred too far north wholly to make a mock at auguries. While she sat at dinner fatigue and excitement could not quite account for her paleness, and she paused and started more than once as there came a fiercer rally in the turmoil without. Do you wonder at her weakness? So did not Ralph Atherstone when, an hour later, he looked forth into the night, and remembered that those livid gleams—more grewsome than the horror of great darkness that came before and after—were shed by his honey-moon.

FLIRTATION WITH THE MODERN CONVENIENCES.

LUTIN was sharpening a pencil, out at window. She had nothing better to do, the day was fine, and she turned the pencil about in the sharpener in a leisurely manner, looking, between whiles, right and left at the various rear windows opposite, and those wretched quadrangular Saharas, adorned with vases and yellow grass-plots, known as back-yards. She was not specially curious, but, as I have just said, had no better occupation. Perhaps, also, she was not unconscious that a girl of eighteen, with peach cheeks, white throat, and dimpled hands, framed in between her half-open blinds, was not an ugly picture, should any body be looking.

It happened that somebody was looking; and suddenly she became aware of it. Through the slats of her blind she caught the gleam of an eye, and, though it was instantly withdrawn, she heard in her neighbor's window a giggle—a soft, womanish giggle. Mischief gleamed at once in Lutin's eyes. Some girls were playing at bo-peep with her. Very well, she would catch them. She turned and turned the pencil, and presently was aware of the eyes again. This time she saw, also, short, clustering curls about a forehead fair enough, but too high for beauty, before the head was withdrawn. A third time, and Lutin, sly puss, ready now for her spring, turned suddenly, with a laugh, and confronted—a man!

Lutin darted back, and drew her blinds in a panic. The impudent wretches! there were

more than one, for she could hear them laugh. What right had they to peer at her, and to drive her from her window? And, now that she thought of it, she would not be driven from her window. Besides, she had not finished her pencil. Besides, she had just heard the monsters next door close their window. There was only a maid in a garden, hanging out clothes, two little boys spinning tops, and—oh! vexation and aggravation!—they—meaning the monsters—had indeed closed one window, but the room owned two, and from the further casement peered two heads, and two pairs of mischievous eyes met hers in full.

Lutin's window-blinds shut hysterically. Her window fell with a crash. Exit Lutin, with burning cheeks, vowing never to look out again.

Still, it was provoking, very provoking, when you come to consider it. People really live at the backs of their houses. Shut up in her apartment, Lutin had constructed a number of little dramas out of such materials as she saw in doors and windows, and pleased herself with watching their progress from day to day. To be restricted to twilight views was intolerable, at least so she told herself; for I am not quite sure whether there was not a pleasurable flutter of vanity, after all, in her silly little heart, and whether she would not have been disappointed at finding the coast clear. But just then her attention was attracted by a soft, low whistle. The horrid, odious, sly, deceitful, provoking, persistent wretches were at it again. Lutin retired with the usual window crash, and her neighbors hypocritically responded with one of theirs; but Lutin was growing much too wise to be caught in that way, and was not to be cheated into showing herself.

Here this story takes a jump, being constructed on the principle of the children's puzzles; put this and that together, and see what you make of it. Tom Keene and Fred Capron, members of the Go In For Fun Club, are tranquilly smoking in Tom's room, all un-awares, at least is Capron, that hidden in Tom's little dressing-room are Mollie (Tom's sister) and Lutin; both ladies, in peignoirs and with hair about their shoulders, having with difficulty effected an escape from Tom's room, where they were nearly surprised by the unexpected arrival of that young gentleman and his friend; and,

"The next subject before the club," said Tom, tranquilly puffing, "is the bachelor, and his condition. No need of reading up on that, I take it. It is soon said. The bachelor is to other humans what the flying-fish is to the other inhabitants of the sea."

"How do you make that out?" Capron lazily lying back, and looking not the least in the world like any thing harassed or worried.

"Make it out! It makes itself out." Tom energetic and gesticulating. "Show me another creature, persecuted, hunted down, trapped, like your bachelor from the time of his first

coat-tails. All the old maids, to begin with, are resolved into a committee of inquiry as to his proceedings. There's Riker goes out twice a week, you know, for German or something of the sort; and that confounded Ophelia Briggs calls across the table, 'Oh yes; give Mr. Riker his dessert early; when gentlemen are in a hurry to get away regularly twice a week, we all know what that means.' And there sat Miss Laura, the girl he is sweet on; and you know Riker's faculty for blushing, and there was no end of a row at once. Miss Laura won't speak to him, and Riker's been regularly miserable for the last six weeks."

"Oughtn't to blush! I never do. I'll back myself against all the old maids in Christendom." Capron still philosophical and unmoved.

"Oh, you will! How about the mammas and the marriageable daughters? They are all sympathy and kindness. A fellow has some soft spots in his heart—can't be all shell, you know—gets the run of a place, and goes there because it's something like a home, you know; and if after a reasonable time he don't begin to talk of matrimony, why there is Laura's, or Sophie's, or Jenny's heart broken into bits—a regular smash. It is my belief some girls grow a set of hearts, just as a crab does a set of legs. Can't account for the number of times some girls I could mention have been heart-broken in any other way. Just let a girl like that get hold of a fellow, and she is like one of those squids—all soft—clings to you like a jelly—you can't move but you hurt her; and yet ten men can hardly pull her off. Mean dinners, cold parlors, colder bedrooms, and spies wait for the bachelor at home; traps, snares, pitfalls, shams, deceptions abroad are his portion."

"Ay!" said Capron. He had come now to the end of his cigar, and was ready for argument. "That is the bachelor in his larva state; before his eye-teeth are cut; no more like what he is after than the butterfly is to the worm. Do you want to know how I silenced the inquisitive elderly females in our establishment? 'Madam,' said I, on the very first question that was asked me, 'I really don't know. I am trying to get rich as Stewart did—by minding my own business.' They voted me a brute, of course; but that silenced them. If I want an introduction to pretty girls I get it—there are no soft spots in my heart; and I treat the mothers as if in a civil way they rather weren't there. That disconcerts them. Nobody hints at my intentions. If I want the entrance to any house, there are plenty of nice girls only too glad to take me. You must either use them, or let them use you. I prefer the first. To my mind there is no such blessed and happy and glorious being as the desirable young man. Every body wants him. Mammas pet him; nice old gentlemen with grown daughters coddle him. Stylish girls take him to drive, and come down town and ask him out to lunch. Is he obliged to marry

any of them? Not at all. Let them do as they like. So much the better for you. Who is doing this—you or they? I can't see, my dear fellow, that it is your look-out at all. It is a business speculation. You are no more bound to reward them than a fox is to be trapped, or a deer to fall dead because I aim at him, or fifty thousand dollars to insert itself to my credit in my bank account because I have purchased certain shares of Erie. They lay out their capital and run their risk—not the bachelor. His ways are made smooth for him, and his paths straight. Even flirtation may be said to be had with all the modern conveniences. The nineteenth century man is a lazy fellow. After storming about down town all day, he hasn't energy left to go through a chapter of a three-volume romance, commencing with raptures over a single glance through a window. Besides, it hardly pays to be ecstatic, or very persevering about any thing but money. Modern civilization recognizes that fact, and provides for it. All that is needed now is, to hire a back-room in a good locality, and open the window. We do, and you should see the ladies we have on our list. There is the lady in brown, and short curls. She plays in an engaging manner with the dog in the bow-window, or frolics with young ladies who come to see her—always in the bow-window. We study human nature and *tableaux vivants*. There is the lady with the back hair; she obligingly shakes it down before the window (very fine hair it is, too), and telegraphs our way. There is the lady who flirts with the handkerchief. There is one kind soul who will wait hours till we get ready to appear. There is a lady in purple, who is perfect in the deaf-and-dumb alphabet. We have no end of fun with her. She is continually getting shocked, and going away, never to return, and coming back in the next five minutes. She asked us to see her the other night, and we went, Jim and I. Jim was Mr. Dolls, and I was Mr. Gates; and she had a lisp; and when she said Misterth Dolls, I thought Jim would kill himself with trying not to laugh. There is the lady who is very shy behind her curtains, and a little girl at whom we peeped behind her blinds, shyer yet, but still not cruel. She is always very much startled to be caught, but I notice that she always comes back to be caught again. And, talking of that, the rising generation are not a whit behind us! You should hear my brother Will. Will is eleven, you know! The other day he appeared at table, important and disgusted, about equal parts. He had said the day before that a certain Tadie was the prettiest girl in the next house—'just to tease the other girls,' he declares; and Miss Tadie, hearing of it, sent him word that, if he liked, a cord could be fastened, leading from her window to his, on which to forward 'notes and things.' 'Isn't she jolly green?' says Will. 'I sent word that I had no cord, and she sent for answer that she would take care of all that; she had plenty.'

Tom burst into an uproarious fit of laughter, and Mollie, in her hiding-place, giggled sympathetically; but Lutin, strange to tell, was in tears; for this odious, sneering, cold-blooded Mr. Capron was her next-door neighbor, and she was "the little girl at whom they peeped through the blinds, and who was not cruel." Poor Lutin! Her tears were not simply for her mortified vanity. Where was the hero of the romance she had unconsciously woven behind her blinds? the modern Sir Kenneth and Sir Tristem—modest, brave, faithful, devoted—unless, perhaps, there showed a glimpse of him in Tom, who had certainly not joined in the sneers of his cynical companion; and could this be the conclusion at which it was intended that she should arrive? Tom Keene was notoriously sweet on Lutin. Mollie, his sister, was Lutin's confidante, knew the thrilling story of the windows, recognized Tom's friend Capron, and also the fact that Lutin was not to be saved by the ordinary preachments. Could this extraordinary coincidence, of the surprise, and the conversation on bachelors, have been a conspiracy between Tom and Mollie—an accident, done on purpose? Only two things are certain. Lutin was seen no more behind her blinds; and one of the few points on which she differs from Tom, now her husband, is in a somewhat unreasonable antipathy to his great friend, Fred Capron.

THE HAPPY VALLEY.

IN this practical century, with its railroad insulting the venerable majesty of Mount Washington, its suspension bridge spanning the tremendous chasm of foaming Niagara, and its telegraph penetrating the sacred mysteries of the deep sea, there were yet found three souls who dared to start on a pilgrimage to the Happy Valley that lies hidden away from the world among the mountains through which winds the Tuscarawas River, in Ohio. These souls did not seek the end of the rainbow, as a gay-colored steed to carry them through space; neither did they attire their bodies in the flowing robes and cockle-shells of wandering pilgrims; but early one summer morning, father, Sadie, and I took our seats in a light carriage, and drove through the sleeping town, leaving behind us the misty lake, with its spectral sails, and turning our expectant faces toward the south, where quiet farm-houses and quiet lives are hidden away among the distant hills.

For two long, bright days we rode toward the south, following the windings of a sparkling river, now crossing it on an old red-covered bridge, now fording it, as the shallow water spread itself gayly over a pebbly bottom, and now riding for miles on its curving bank, startling the solemn heron from his morning fishing, or hearing from the deep lush grass on the other side the persistent cry for "Bob White" from the hidden quail. On the third day we came into the region of the great barns—huge red

treasure-houses where the spoils are garnered—the wealth of green fields stretching away on either side, so luxuriant, so wantonly, riotously rich, that the very air seemed filled with concentrated essence of life, and we expected to see shy dryades peeping from every tree, white-armed naiades sporting in every brook, and even old Pan himself, dancing through the meadows to the music of his reed-pipe, as he did in the early days when the world was young, and the gods reigned gayly on Olympus.

In the afternoon we reached the hills, and, entering their shady defiles, wound up from height to height under the giant beech-trees, now catching glimpses of undulating seas of verdure, now plunging into narrow, dusky glades, where the road seemed lost amidst the wild underbrush, and squirrels gazed at us with their bushy tails uplifted in astonishment. We had been for some time slowly toiling up a steep hill when the sinking sun sought us out, and sent his golden beams under the dense foliage in long rays across the road; suddenly we emerged on the breezy summit, and, as if by magic, the forest disappeared, and velvet wheat-fields stretched away on both sides over the rounded hills and down to the valley beneath, where a broad river gleamed under the willows, and white houses, half hidden in green orchards, greeted our eyes with peaceful beauty in the still evening air. We reined in the horses, and noted the circle of hills guarding the plain on all sides, save where the river flowed on toward the south through a narrow defile, and the dense forest closed over the water as it disappeared in the dusky recesses. The green fields stretched up the hill-sides from the plain, and at the summit were met by a wall of unbroken forest and underbrush, impenetrable and pathless, the only clew to the labyrinth being the narrow road we had followed by the side of the river leading from the outside world into the Happy Valley. Below us lay the village, each house in its little orchard; and in the centre stood the antique church, the distant bell even then ringing out the evening song, that labor was over, and that men must now return to their homes, and give God thanks as the sun went down. From all sides we could see the laborers returning from the field, the long line of loitering cows slowly winding through the lanes, and the plowmen with their patient horses moving toward the village, where a faint curling smoke from every chimney showed preparations for the evening meal. Moss-grown dykes, shaded by huge willows, protected the banks of the broad river, and here and there a shining little mill-race ran gayly through the meadows to some quaint, red-tiled mill, then plunging foaming over the stones, hurried on to overtake the old river sweeping steadily on to the south. No road was visible in any direction, excepting the shady streets of the village, and every where else the tree-bordered fields stretched over the plain, and up to the forest-crowned hills, which stood like ramparts against the sky, a fortifica-

tion from the outside world. We drove slowly down into the valley, passing groups of laborers in their uncouth costumes, and following the full-uddered cows, with fragrant breath and mild eyes, as they wound toward the white dairy buildings, where a girl stood on the steps, blowing an antique horn to hasten the loiterers. An old white-haired herdsman, with staff and scrip, followed behind, glancing at us with shrewd interest from under his patriarchal hat, while three genuine shepherd dogs ran hither and thither among the cows, keeping them in order, and chasing the stragglers, with wonderful sagacity. We alighted at the dairy, and followed the cows into the large yard, where each one walked unhesitatingly into her own stall, and the milking commenced. The barns formed three sides of a square, with a paved court between, and stalls for ten cows in each compartment. The floors, pails, and tubs were scrubbed daily by the dairy girls, who also washed the cows carefully with warm water before milking; and, seated on their little stools, sang together some merry song, as the milk fell foaming into the red tubs. Then these ruddy milkmaids formed a line, and, balancing the heavy tubs on their heads, marched steadily through the yard into the dairy beyond, where they poured the milk into a gigantic tin hog's-head, with a white linen cloth tied over the top as a strainer. A venerable "milk-mother," in white cap and clogs, stood down in the lower story, and ladled out the strained milk into innumerable pails, each with its hieroglyphic sign on the cover, denoting to which household it belonged. As the rosy girls came marching in, they lifted the heavy tubs lightly down with their stalwart arms, and, as they poured the milk into the foaming strainer, glanced shyly at our crinoline-distended skirts, kid gloves, and slender forms; while we, with equal interest, observed their blue homespun gowns, with waists under the arm-pits, leg-of-mutton sleeves, white neck-handkerchiefs, white caps, and wooden shoes. Surely, never were such disfiguring costumes invented for the female form; but we were obliged to confess that the broad, erect shapes under them were pleasant to the eye in these days of crooked spines and sunken chests, while the heavy braids of golden hair stowed away under their prim little caps would have made many a belle envious. Still the milkmaids poured, still the milk-mother ladled, and yet there was more. We walked into the cellar, where hundreds of full tin pails were standing in a stream of running water, brought from a spring, and cold as ice, while ranged on shelves were rows of golden cheeses, and, just outside, the great horse-churn, and presses weighted with boulders. The dairy-man's cottage stood in the garden, surrounded with rose-bushes and pinks; white curtains, in stiff, starched folds, shaded the little windows, and, within, we could see the high bed, with steps to climb into it—a pulpy mass of feathers on top, covered with a gay counterpane. The

houses were all furnished alike—the antique bed being the venerated article of furniture—and snowy linen was in universal use, both for sheeting and underwear, as the old women were wise in weaving, and the "linen-mothers" vied with each other in long night-watches over the bleaching rolls. The architecture was quaint, and reminded one of Old World pictures. The red-tiled roofs projected over the street, and great cross beams, filled in with mortar, formed the walls; little dormer-windows were perched here and there, with no attempt at regularity; and a wooden sun-dial invariably crowned the little piazzas, where round-eyed babies, clad just like their parents in miniature, stared solemnly at us as we strolled by to the hotel, a large white building, regarded by the entire community as a wonder of size and beauty. The smiling landlord appeared, rubbed his hands, and, in answer to our inquiries, replied: "Gut fare für mann und beast; one feed victuals, twelve cents; we keeps folks for forty-five cents a day, but we allows kein smoke und kein swear; breakfast at six, dinner at twelve, supper at half past five; walk in." So saying he ushered us into a grim parlor, with wooden chairs drawn up in martial array around a large table, and four strange little pictures on the walls, which came from Württemberg fifty years before, and might well be called naturally pre-Raphaelite. Meanwhile the landlord, at the back-door, was shouting for "Yacob! Yacob!" in the direction of the long barn; and presently appeared an ancient hostler, who spoke a mixture of German, French, English, and gibberish, and was reputed to be a gipsy, and the owner of untold wealth, stored away in the dark recesses of the barn. As he led away our horses a rosy youth appeared, to show us to our rooms—a series of little cells, each with its lofty bed and steps, one window, with snowy, prim-folded curtains, one chair, and a large square hole in the side of the wall as a ventilator, where the chattering martins amused themselves by flying in at early dawn, and waking me with their shrill cries. The gayly colored counterpane was woven with figures of strange birds; the snowy linen was marked in red with the two letters "W. H."—Wirth-haus; and the yellow-painted floor, blue-cased windows, and scarlet door made the little cell quite a gay abode. The rosy Johann brought up our bags; and when we presented him with a small fragment of Uncle Sam's scrip, he fingered it doubtfully, and finally returned it to us, saying: "Nein; es ist gut für nichts." Surely we had reached the Happy Valley indeed, when money was "gut für nichts!" All the males in the village were dressed exactly alike, in tight, short, blue pantaloons, long-flapped calico vests, scanty, short-waisted, blue dress-coats, with two brass buttons behind; scow-like shoes, and broad-brimmed white fur hats—which, being a sign of masculine superiority, were never removed on any occasion. We sometimes doubted whether they did not sleep in them, as,

wherever we went, at any hour of the day or night, the great fur hats crowned the men, extinguished the boys, and stifled the babies with their awful dignity.

A bright girl of sixteen came to tell us that "Abendessen" was "fertig," and we went outdoors into another building where, in a long dining-room with rows of windows on each side, a spotless table-cloth and shining blue crockery invited us to try the hot coffee, pitchers of rich cream, little rolls of fresh butter without salt, Dutch cheese, apple butter, bretzels, and cold meat. Rosy Salome stood behind us, like a grenadier, armed with a waiter, and was indefatigable in offering some cucumber pickles about ten inches long, swimming in a doubtful gray liquid, and garnished with pepper-corns. Her shining braids were tightly coiled away under her white cap, and her apron tied with especial care under her arms, in honor of the strangers. She understood no English, but smiled abundantly; and, finding we spoke German, asked us how old we were, and if we were married, with a calm audacity that belongs to the Happy Valley. The bill of fare at the hotel was not extensive—for breakfast we had delicious coffee and rich cream, hot bretzels—the queen of cakes—fresh butter, and stewed young doves. For dinner we had a nondescript kind of meat; we could not decide whether it was boiled roast beef, or baked corned beef; but whatever it was, the essence had been carefully removed by long and patient cooking, so that it was innocent of taste, and spongy in texture. Then came stewed noodles, potatoes fried whole and served in cream, rice plentifully peppered, sauer-kraut fritters, and preserves of fruit and molasses. We soon learned to relish these dishes, although we did not succeed in acquiring the constant hunger of the natives, who, after partaking of a hearty breakfast at five o'clock, are ready for a luncheon of bread, cheese, and beer at nine; then they all come home to dinner at twelve, and the afternoon is broken by a lunch at four; when they work again until six, at which hour, the labors of the day being over, they assemble around the supper-table for a hearty meal; and, finally, before going to bed, they place some eatables by the bedside, lest they should be hungry in the night. Such hearty appetites have produced a stalwart race; for their constant labor keeps down their flesh, and their early hours and quiet lives give them fresh complexions and perfect health, even to advanced age.

When we had finished supper we strolled out into the town and listened to the young men and girls singing together on the piazzas, while a rustic band of home-made instruments accompanied them in the simple melody. The following is one of their songs, with the translation:

Freund, ich bin zufrieden, geh es wie es will,
Unter meinem Dache leb ich froh und still,
Mancher Thor hat alles was sein Herz begehrt,
Doch ich bin zufrieden, das ist Goldes werth.

Leuchten keine Kerzen um mein Abendmahl,
Schimmern fremde Weine nicht in Goldpokal,
Findet sich doch immer was man braucht zur Noth,
Süsser schmeckt im Schweisse mir mein Stücklein Brod.

Wenn ich ruhen werde unten im kühlen Sand,
Führt der Herr der Erde mich an meiner Hand,
Und auf meinem Grabe steht kein Leichenstein,
Eine Rosenstaude soll mein Grabmal sein.

Friend, I am contented, happy, come what may,
In my lowly cottage glide the years away;
In the world beyond us some have wealth untold,
But I am contented, better far than gold.

At my evening meal no waxen tapers shine,
No rich goblets sparkle filled with foreign wine,
Out beyond the hills such things perhaps may be,
But my hard-earned bread seems sweeter far to me.

When death calls me home no marble stone shall rise,
God above in heaven knows where my body lies;
No monument shall point out where I lie at rest,
A little rose-tree only shall blossom o'er my breast.

In the last verse allusion is made to one of their customs; unlike most Germans they attach no importance to the last resting-place of their loved ones, but bury their dead in a field on the hill-side with neither stone nor mound to mark the place. The grass is kept smooth and green, and rose-bushes bloom by the fences: "Those who love me will remember where I lie, and when they are gone let me be forgotten," they say.

There is a store in the village, where all accounts are kept and political meetings held before the annual election of trustees; what will the Sorosis say when they hear that all measures for improvement are steadily opposed by the women, who outvote the men, and cling to the obsolete customs of the last century with a dogged pertinacity worthy of a better cause? Love does not seem to be a ruling passion in the Happy Valley. We discovered a promising flirtation between rosy Salome and one of the clerks in the store, and watched for the signs of young love, expecting to see the primitive courtship of Adam and Eve in all its pristine purity. Alas! for the fatal result. One evening we observed that Salome had a rose inserted in her braided hair, and concluded that Louis was expected after the work was done and the vine-covered piazza free from all intruders. Later in the evening, returning from a row on the river, we saw Louis sitting on the steps of the store, and after a few moments of conversation I asked, "Are you not going to see Salome this evening?"

"Oh no," he replied, phlegmatically; "I goes to see her once a week; if I goes more it spoils herself."

"But perhaps she would like to see you," I suggested.

"Ya wohl, aber es ist nicht gut to gif the wimins too much their own way; I must begin now, or else she will not work well; wimins is so lazy."

Another incident. The pastor once observed that one of his trustees did not marry, so he called him into the inner office one afternoon and expostulated with him, showing forth the expediency of the married state, and asking him if he would not take a wife.

"If you think best, pastor."
 "What do you say to Paulina B——?"
 "Just as you say, pastor."
 "Will you be married this afternoon?"
 "If you think best, pastor."

So the matter was settled, the trustee returning to his work and quite forgetting the important change before him until the pastor summoned him to the office at five o'clock, where stood the rosy Paulina, who had left her spinning for ten minutes, and the twain were soon made one flesh. After a short pause the trustee asked, "Have you any thing more for me to do, pastor?" and a negative answer being returned, he went back to his account-books without a word to his bride, who returned to her spinning as phlegmatically as she had come.

On Sunday we went to the little church and watched the long file of worshipers march gravely in, the men at one door, the women at another, and seat themselves in solid rows on the blue benches, when the service began with a hymn, followed by a long sermon, during which every time the name of Jesus was mentioned all heads reverently bowed. The singers were accompanied by a band of ten musicians seated on a platform near the pulpit, who elicited very sweet music from a collection of quaint wooden pipes, flageolets, flutes, and violins, whose patterns came from the old country half a century before, and, like every thing else in the Happy Valley, remained unchanged. The whole congregation joined in singing the peculiar wild choruses, the women repeating the last line alone, and dying off into a whisper at the plaintive minor chord which always formed the unexpected close, while we felt transported back into the early ages of the world.

The inhabitants of Happy Valley, ignorant of the value of money, and living in the simplest manner, are yet a rich community, owing to their industrious habits and systematic labor. Their domain consists of over ten thousand acres of highly cultivated land, a coal mine, and a bed of iron ore; they have several large mills and factories, as their invariable rule is to manufacture every thing they use; their cattle are models of beauty, and their horses powerful and well groomed. One bakery supplies all the bread, one laundry attends to the washing, and one nursery receives all the little ones, while their mothers take part in the active labors of the field or dairy. Their morality is without a flaw, for since the foundation of the community there has never been a case of law-breaking among them, and their lives flow on as peacefully as though the hills were permanent barriers between them and the noisy, busy, wicked world. Few among them have ever wandered three miles away from the village; they shun all contact with strangers, and when we asked one of the girls if she would not like to go with us to the city, she smiled, and replied, "Oh no! I'se better here." That answer embodies the spirit in which they live and die.

The little band who left their Fatherland and

toiled through the unbroken wilderness to the remote banks of the Tuscarawas River fifty years ago, with Bibles in their hands and faith in their hearts, have nearly all been called to rest from their labors; but the few white-haired men who still wander through the quiet streets, or gaze abroad upon the rich fields, seem pictures of perfect contentment, that rare blessing of old age.

Happy little Valley; our ways are not as thy ways, but who can say that thou hast not chosen the better part?

A FLOWER PIECE.

WANDERING of late beside a northern shore
 That longed for summer, and the wild beach grass,
 And dip of oar, and splash of pearly feet,
 And happy laughter on its lonely sands,
 I heard a young voice caroling some song,
 Nor knew I was in elf-land while I heard.
 It sang, and slowly trembled into rest—
 Slowly, because the earth was loth to leave
 The high melodious dalliance.

But before
 The sweet sound fled to silence, eagerly
 A rustle and a rush of flying wings,
 Like leaflets blown before a frosty blast
 When woods stand shivering, caught and bore it off,
 Lost in the airy clamor of their flight.
 And, as they went, wild music followed them;
 The tune the breeze winds in and out the grass,
 The tune to which the clouds and sunshine play
 O'er slopes of blushing clover—faint at first,
 With many a fluttered echo frolicking,
 It fell its windy way—then loitered down,
 With lingering cadence of a sweet delay,
 Lightly as in the tenderest deeps of even
 The golden blossom of the new moon drops
 Below the west that woos it.

'Twas the voice
 Of all the elves of all the flowers that blow,
 Flocking to find the Spring, who slumbered yet,
 Nursed by the blue-eyed April. Willow plumes,
 Harebell, and cowslip, and anemone;
 The silver cinquefoil, and the columbine
 That bursts, a lance of hoarded light, from earth,
 And swings its red flame on the shining tip;
 The purple vetches, washed by salt sea sprays;
 The frail convolvulus, that, ere the year
 Is at the flood, leagues with the building bird,
 And the rude way-side tangles o'er her nest.
 All sweet things of plot and pleached alley—
 The mimic nun of the snow-drop, and the friar
 Dwelling within the hooded aconite;
 The maidens of the pale chrysanthemum,
 The royal lady of the proud and fair
 Japonica, and ev'n the merry mites
 That balance on the trumpet-flower's edge,
 Tippling their horns of honey. With them, too,
 All the delightful things of old romance—
 The royal violet, and Sappho's rose;
 The fleur-de-lis, the flower of chivalry;
 The lotus, born of the eternities,
 Holding immortal ichor—hovered there,
 Hovered a moment, quiring in one strain,
 Then falling, failing, ever on the wing,
 Sought other skies.

And I, upon the shore,
 Watched a far bark into a bank of mist,
 A dim blue bank built up along the sea;
 The bark still sailing, hull and tapering spire
 A line of light, silverly swathed about
 With deepening vapors, slowly gliding on
 To denser shadow, slow and ever slower,
 Fainting and fading, till a phantom craft
 Was hid in murk recesses of the cloud,
 A vanished apparition—and far above,
 Upon the pallor of a peaceful sky,
 Fair Hesper, like a flower, bloomed out in heaven.

RUPERT'S LAND AND ITS PEOPLE.

By RANDOLPH B. MARCY, U.S.A.

THE late insurrection among the people at Winnipeg, upon the Red River of the North, resulted from the act of recession by the Hudson Bay Company to the crown of Great Britain of that vast domain in British North America known as "Rupert's Land;" and which, under a charter from Charles II., in 1669, was granted to Prince Rupert, eleven other noblemen, and six commoners, who were styled "The Governor and Company of Adventurers of England trading into Hudson Bay."

This extraordinary grant embraced all the territory drained by the waters flowing into Hudson Bay, as a compensation for which the Company was required yearly to pay the King and his successors *two elks and two black beavers*.

With Prince Rupert as provisional governor the association immediately instituted measures for taking formal possession of the country ceded, and, with the exception of a brief period of seventeen years, when it was held by the French, the Company has claimed the occupancy and control of it ever since. Under the provisions of an act of the Imperial Parliament, entitled "British North American Act, 1867," her Majesty, with the consent of her privy council, and upon the application of the Canadian Parliament, was empowered to admit Rupert's Land into the Canadian confederacy; and a supplementary enactment in 1868 authorized the Queen to negotiate with the Hudson Bay Company for the surrender to the crown of all the rights and privileges conferred by its charter.

In March, 1869, the acquiescence of all the parties concerned was secured to the terms of a compact, whereby the Canadian government agreed to pay the Company three hundred thousand pounds upon the actual transfer of Rupert's Land to the Dominion of Canada.

The anticipation of an early consummation of this transfer from the domination of the Hudson Bay Company, and the consequent necessity of a new governmental polity for its occupants, with the feeling of apprehension and consciousness of uncertainty regarding their future political status, in the determination of which they might have no voice, together with their nearly unanimous opposition to Canadian rule, and its avowed policy of greatly increased taxation, were the chief causes of the *émeute* alluded to, and which led to the summary ejection from the colony of the prospective Canadian governor, M'Dougall.

The contiguity of these people with our own border settlements, and the neighborly relations of commercial and social intercourse existing between them, have caused considerable interest to be manifested throughout the United States in reference to the ultimate settlement of the question at issue.

In view of these facts I take it for granted that a brief description of this somewhat remote and unfrequented section, with some observations upon the history of its early settlement and the character of its present inhabitants, will not prove altogether devoid of interest or instruction at this time.

With the purpose of establishing an agricultural colony, the Earl of Selkirk, an enterprising Scottish noble, who was largely interested in the Hudson Bay Company, in 1811 purchased from that association a portion of its lands, upon which the present settlements at Red River are located, and during the following season he brought out from Sutherland, Scotland, several families, and attempted to establish them as a nucleus for his colony near where Fort Garry now stands; but on their arrival they were confronted by the *attachés* of the hostile Northwest Company, who assaulted them and drove them back over the border to Pembina. They then burned their tenements, appropriated or destroyed their property; and it was not until 1815, when Lord Selkirk received a reinforcement of emigrants, that he was enabled to occupy the lands he had originally selected for the colony.

The hostility of the Northwest Company toward them did not cease, however, and during the following summer a sharp conflict occurred, in which quite a number were killed on both sides, and the colonists were temporarily dispersed; but the arrival shortly afterward of another reinforcement of one hundred German, French, and Swiss disbanded soldiers enabled them to return to their farms. But they continued to be molested until 1821, when the consolidation of the two fur companies settled the quarrel, and no collisions took place subsequently.

Immediately after the coalition of the two rival associations, the colonists erected permanent habitations and planted large fields of grain, which, in that prolific virgin soil, yielded bountiful returns, and the nutritious prairie grasses caused their cattle to fatten and multiply so rapidly that in a brief period they were supplied with a profusion of bread and meat; but when they desired to exchange the products of their labor for sugar, tea, or other imported articles, they discovered that the remoteness and inaccessibility of all markets rendered their grain almost valueless. Fifty bushels of wheat, for example, would not purchase a pound of tea or a yard of cloth. As a consequence they were compelled to forego the use of many of their accustomed luxuries, which caused them to become so much discouraged at the cheerless prospect before them that some returned to Europe, others removed to Canada; a few Welsh families went to Galena, Illinois, where one of the original patriarchs, Shetland by name,

still survives; while the others remained upon Red River, Lord Selkirk having abandoned the colonizing enterprise and returned home.

At Pembina I encountered an exceedingly interesting old Irishman by the name of Peter Haden, who came to the country with the first colonists in 1812, and had lived here ever since. Although he must have been at least eighty years old, yet all his faculties were in remarkably good preservation, and he seemed to remember every man of more than ordinary note who had ever visited the country.

He informed me that shortly after they arrived upon Red River Lord Selkirk directed him to proceed to Kentucky for the purpose of procuring sheep for the colony. He started at once with only two companions; accomplished the perilous journey; and after purchasing 3000 sheep, set out on his return, traversing day after day, and week after week, the then solitary and unpeopled prairie wilderness of Illinois, Wisconsin, and Minnesota; and after several long months of wearisome journeying over a distance of some 1500 miles, wherein he encountered numerous mishaps and disasters, as well as hair-breadth escapes from hostile savages, he at length reached his destination with only 250 of his original flock remaining. The others had died, been killed by the wolves, or stolen by the Indians *en route*. The old veteran pioneer spoke of his connection with Lord Selkirk with emotions of deep and kindly feeling, and eulogized him as a philanthropist of the most generous and noble impulses.

The population of the Red River settlements at this time consists of the descendants of the Scotch and English emigrants who remained here after Lord Selkirk's departure, and who have maintained their nationality intact, without any commingling with the aboriginal race. They are generally agriculturists, having well-tilled farms and good stocks of cattle and sheep; showing conclusively that they have not degenerated, or departed from the frugal, industrious, and thrifty habits transmitted to them by their ancestors.

Several whom I met with had accumulated respectable fortunes, and were living most comfortably in stone or substantial framed houses.

They have several churches and school-houses, and seem to be a moral and intelligent people.

Besides these, there are several thousand mixed breeds of French and Indian lineage, descendants of the *courriers-du-bois*, as the employés of the fur companies are termed; who, after the expiration of their service in the companies, have settled here and married Indian wives. They inherit all the vivacity and buoyancy of temperament of the French, united with the erratic, roving propensities of the Indian element.

Although they cultivate small patches of ground, and pass the winter in their rude cabins, yet the majority of them have for many years been in the habit of making, yearly, two

excursions into the plains, toward the Missouri and Saskatchewan rivers, in search of the buffalo, which hitherto has constituted the chief item of their commissariat.

I encountered hundreds of them in 1868, upon the elevated Coteau du Missouri, west of Devil's Lake. They were accompanied by their women and children, and carried all their limited household furniture in their peculiar one-ox carts; and although they had been very unsuccessful in their hunts, not having seen a single herd of buffalo, yet they appeared cheerful and happy, politely doffing their caps and smilingly bidding us "*Bon jour, messieurs*," as we passed.

The aggregate population in the Red River settlements at this time is estimated at from ten to twelve thousand, about one-half of whom are of Canadian origin. I saw very few natives of the United States among them.

Good crops of wheat, barley, oats, rye, and vegetables were produced here prior to 1865, when countless myriads of grasshoppers made their appearance, and for four successive seasons destroyed nearly every vestige of a crop throughout the entire limits of the colony.

At the time of my visit, in 1868, the inhabitants had become so much disheartened that it was believed, if the dreadful ravages continued another season, they would produce so much of a famine as to compel the inhabitants to abandon the country and seek other homes. Fortunately for them, however, the scourge was not repeated last year, and fair crops were produced.

It is difficult for a person who has not seen these hosts of insects to conceive of the extent of the devastation which they leave in their trail. From whence they originally come, or whither they go, is, I believe, as yet involved in mystery.

A Delaware Indian, upon one occasion, remarked to me that the prairie tribes were, as a general rule, close observers of the habits and peculiarities of the animal creation. In evidence of which he said he once described to a chief some of the achievements of civilization, such as the introduction of steamboats and railroads, which seemed to produce some impression upon the mind of the savage, who admitted that the pale-faces, as a general rule, possessed a good deal more knowledge than the Indian; but, added he, "are they able to tell where the grasshoppers go to?"

We know that they come with the wind, and their appearance in the atmosphere is not unlike that of a dense snow-storm, which almost obscures the sun's rays; and when they alight upon the ground they literally cover it for miles in every direction; and are often seen piled upon each other several tiers deep.

So voracious are they that they only require a few hours to utterly destroy large fields of grain.

At one time in 1868, as I was informed, they were heaped up against Fort Garry to the depth

of three feet, having struck the walls in their flight and dropped down at the base; and this great accumulation of animal matter generated so offensive an effluvium that the people of Winnipeg were for several days engaged in removing the nuisance, to prevent a pestilence.

When these ravenous insects first made their appearance they evinced a discrimination in the choice of their food, first attacking the onions, which they devoured to the roots; and, strange as it may appear, they did not, until the last season, seem to relish green pease. Then they made indiscriminate assaults, demolishing every trace of grain and vegetable as clean as if a fire had swept over the land.

It is fortunate that their advent and ravages were confined to a sparsely populated district of country; but should their migrations hereafter extend into the more densely settled sections, like the grain-growing districts of Iowa, Illinois, and Minnesota, it would be difficult to estimate the amount of damage that might ensue from the destruction of crops. That their raids are very extensive is evident from the fact that their track was distinctly visible over almost every foot of the country for a thousand miles that I traversed in 1868.

Those who have studied the habits of these insects have observed that after they have exhausted their powers in laying waste a section of country (about the latter part of August), they bore holes in the ground, wherein they deposit their eggs or *larva*, and disappear. During the first warm days of the ensuing spring the young insects are hatched, and crawl out upon the surface, while they are so diminutive as to be scarcely visible to the naked eye, and only possess power of locomotion sufficient to aggregate in masses, occasionally as large as a bushel measure. Their growth from this period is so rapid that in a few days they are ready to commence their characteristic devastations.

As it has been supposed by some that these insects are the same as the Old World locusts, I remark, that the two species, although analogous in many of their characteristics, are not identical; and, indeed, we have nothing in this country precisely like the locust of Egypt and Syria, which is about three inches long and of a greenish color; while the grasshoppers alluded to are only about half that length, and are of a reddish-brown color. The former are classified by naturalists as belonging to the genus *Pachytillus migratorius*, and the latter to the genus *Caloptenus spretus*. They both come and go with the wind, and are equally devastating in their ravages.

The track of the Eastern locusts has occasionally, since Pharaoh's time, been marked with a greater amount of desolation and loss of human life than has followed the invasions of hostile armies. Even as late as 1867 these insect plagues produced a famine in Algeria, which caused over one hundred thousand natives to perish of hunger.

The Hudson Bay Company has erected two defensive works upon Red River. The site of the one known as Fort Garry was occupied as a French trading post as early as 1662, and is designated upon an old English map, published by Thomas Jeffers in 1762, as "Fort La Reine." It is situated upon an elevated plain within the angle formed by the confluence of the Red and Assiniboine rivers, and is inclosed by a stone-wall twelve feet high and three feet in thickness, with heavy towers pierced for cannon and small-arms at each angle. Within the inclosure are store-houses, magazines, and capacious quarters for the officers and other employés of the association.

Mr. William M'Tavish, the courteous and hospitable chief factor, and, by appointment from the Hudson Bay Company, the Governor of the "Colony of Assiniboine," which embraces the Red River settlements, makes his head-quarters here.

The village of Winnipeg is half a mile below the fort, and contains some three or four hundred people, with taverns, groceries, and other concomitants of an embryo Western town; and here, among a variety of other nationalities, we found a representative of the irrepressible cosmopolitan Yankee nation—a keen shop-keeper from "down East," who, we were told, was fully up to, if not a little ahead of, the sharpest of the Scotch or English notion-vendors.

Twenty miles below Winnipeg is the other work, the designation of which (Stone Fort) indicates the solidity of its structure. It crowns an elevated plateau bordering the left bank of the river, and is built of dressed masonry, with circular towers at the angles, and gateways similar to those at Fort Garry; and is capable of affording effective resistance to a vigorous attack, even if made with artillery of light calibre.

Within this fort are stone store-houses and quarters sufficient for 200 men; and in 1851 the two works were garrisoned by 300 regulars of the Sixth infantry of the line. Subsequently they were relieved by three companies of Canadian rifles, which left here in 1861, and no troops have been stationed here since. From Stone Fort to Lake Winnipeg (23 miles) the river is from 200 to 400 yards wide, and two fathoms deep; and for ten miles before it enters the lake it meanders through a low morass with a sluggish current, offering no obstructions to navigation.

Lake Winnipeg, which is 264 miles long, with an average width of 30 miles, is shallow, and for the most part confined within a rock-bound coast, unpeopled save by fur-traders and Indians.

The Company has a schooner upon the lake, which sails between the different trading posts along shore. Previous to the union of Hudson Bay with the Northwest Company all the supplies of the latter, and many of the former association, were sent from Montreal in bateaux to Fort William on Lake Superior, and thence in bateaux and canoes *via* Rainy Lake and Lake

of the Woods to their destination, this being the only route lying altogether within British territory by which Lake Winnipeg could be reached from Canada.

After the consolidation was consummated this route was abandoned, and for a time all the supplies were shipped from England to York Factory, and thence up Hayes River, and through the chain of small lakes to Norway House on Lake Winnipeg.

A ship freighted with merchandise for the Company has sailed from England annually for over one hundred years, and still continues to arrive at and depart from their *dépôt* at York Factory as regularly as the seasons come round; and I was informed that there never had been a disaster or a failure in a single voyage. Upon both the old routes of communication numerous portages had to be made, and the ponderous bateaux dragged over them upon rollers. Moreover, these routes could only be traversed during midsummer.

The greater part of the Company's supplies is now sent to Fort Garry through Minnesota, and, although it still continues to ship its finest furs from York Factory, the coarser peltries go overland *via* St. Paul. A very significant fact relative to the advantages of this over the old routes is, that merchandise can be laid down at Fort Garry by the St. Paul route at an earlier date in the season than it can leave England with a certainty of having an open passage through the straits into Hudson Bay.

About a thousand carts, each freighted with 900 pounds of peltries, were sent from Fort Garry by the Minnesota route prior to August, 1868. On these duties were paid at Pembina upon a valuation of over \$50,000, while double that amount was bonded in transit for England.

A very unusual feature in the topography of the country will be perceived by reference to the map of that portion of Minnesota which embraces the sources of the Minnesota River and the most southerly branch of the Red River. It is a singular fact that of these streams, rising within a mile of each other, upon the same level (about 980 feet above the sea), one sends its waters nearly south, into the Gulf of Mexico, while the other flows due north, into Lake Winnipeg and Hudson Bay; and in high stages their waters commingle.

Red River, throughout nearly its entire course, is fringed with an extensive belt of excellent timber, and flows with a gentle and uniform current through an alluvial valley from five to twenty miles wide, which embraces a vast extent of the best prairie bottom lands I ever beheld, covered with an exuberant growth of nutritious wild grasses from two to six feet high, from which an inexhaustible amount of hay could annually be made.

Several tributaries entering the river from the east have large forests of pine timber upon their banks, and this, in high stages of water, could easily be rafted down; while the great body of hard timber on the main stream is am-

ple for the requirements of an extensive farming community. Red River is navigable for steamers for a distance of two hundred and fifty miles from its mouth.

As the sources of the Red River are 300 miles south of its *débouché* in Lake Winnipeg, the ice thaws out much earlier in the season upon its head waters than in the lower portions of it; which circumstance has occasionally caused the ice below to become so much choked and dammed up as to force the water out of the channel and inundate the entire valley for miles upon each side. These great freshets are not, however, very frequent, the last three having occurred at intervals of about twenty years, and in each instance the water has drained off in time for the planting season.

The line bounding the northern limits of our possessions crosses Red River near Pembina, where we have a collector of customs with six or eight subordinates, comprising the chief population of the hamlet, which is situated directly upon the north bank of the Pembina River, at the crossing of the Minnesota and Fort Garry road.

Thirty miles above this, upon the Pembina River, is a farming settlement called St. Joseph, of some two hundred *Bois-brûlés*, as the mixed breeds are termed.

The habits and occupations of these people are in all respects like those of the descendants of the *voyageurs* before described upon Red River. An extensive area of bottom land of unsurpassed fertility, with woodland sufficient for agricultural purposes, is found in the valley of the Pembina and Assiniboine rivers; and it is a noteworthy fact that artificial irrigation is unnecessary for the production of crops in this section of country. The arable belt in this meridian of longitude does not extend far north of Lake Winnipeg, as the climate soon becomes too cold and the summers too short for the growth of cereals. At Fort Churchill and York Factory, for example, the ground never thaws more than about three feet from the surface, and remains perpetually frozen for fifteen feet below that depth. The temperature at those places, measured by the gradations of Fahrenheit's thermometer, ranges from 90° above zero in summer to 50° below zero in winter. Some idea may be conjectured of the intensity of the cold from the fact that casks of rum or brandy, when exposed for four hours in the open air to the lowest temperature above indicated, will congeal to the consistence of honey.

It is a meteorological phenomenon familiar to all who have given the subject any attention, that the climate in the northwest of this continent (the altitude being equal) moderates rapidly as we proceed toward the Pacific coast upon the same parallel of latitude; which fact expands the fertile grain-growing belt of country much further to the north in the vicinity of the Rocky Mountains than we find it near the Atlantic Ocean. So important is this differ-

ence that the isothermal line touching the head of the south branch of the Saskatchewan, in latitude 51° and longitude 110° , passes through Chicago and Cleveland, and strikes Long Island Sound near the boundary of New York and Connecticut, in latitude 41° and longitude 73° . In other words, the summer climate upon the head waters of the Saskatchewan, with an average temperature of 70° above zero, is the same as that upon the Atlantic coast ten degrees further south. The limit of successful agriculture in longitude 110° extends as far north as Peace and Laird rivers, tributaries to the Arctic Ocean, in latitude 59° north, where good crops of wheat have been grown.

The Saskatchewan River, with its sources in the eastern slope of the Rocky Mountains, flows for a thousand miles through the Hudson Bay territory, and empties into Lake Winnipeg. It is navigable for steamers of light draught throughout the greater part of its course, and drains a section of country about four times the magnitude of Ohio, which we have the most undoubted authority for asserting to be surpassingly rich and productive, and admirably adapted to agriculture. All the common cereals, excepting corn, have been successfully cultivated at the different posts of the Hudson Bay Company within the district.

Although the winters here are protracted, yet the snow does not fall deep, and cattle run out during the greater part of the year without shelter or any forage save the natural wild herbage; and the buffalo are said to remain fat during the entire winter in the sheltered valleys bordering the river.

Governor Ramsey, of Minnesota, in 1851, spoke of this country in these words: "I hesitate not to ascribe to the whole of the upper plains of the Saskatchewan River an agricultural value superior naturally to the fields of our New England in their primitive condition."

That zealous missionary and disinterested Christian philanthropist, the good Father De Smet, who wintered in 1854-55 upon the Upper Saskatchewan, gives his impressions of that country in the following language: "The entire region in the vicinity of the eastern chain of the Rocky Mountains, serving as their base, 30 or 60 miles, is extremely fertile, abounding in forests, prairies, lakes, streams, and springs. The streams are innumerable, and, on every side, offer situations favorable for mills. The northern and southern branches of the Saskatchewan River I have traversed for 300 miles. Forests of pine, cypress, etc., etc., occupy a large portion of it, covering the slopes of the mountains and the banks of the rivers."

If this country possesses the great natural agricultural attractions that have been ascribed to it, and which have been perfectly understood by the British government for over half a century, the question naturally arises why steps have not before now been taken to populate and develop it. The only solution of this mystery that occurs to my mind lies in the indubitable

fact that English capitalists, when called upon to loose their purse-strings for any purpose involving the slightest hazard, are as alien in their instincts to their descendants in the United States as if their lineage had no approximation since the flood.

The sluggish apathy and morbid caution of our venerable transatlantic progenitors, when contrasted with the fearless, dashing spirit of enterprise and prompt execution which characterize the achievements of our people, receives a forcible illustration in the glaring truth that they, for more than a century, have been pursuing the "penny wise and pound foolish" policy of barring up all avenues of approach to this vast tract of fertile country; and for what purpose?

Has it been from any especial regard they entertain for the rights of the Indians, who, under the acknowledged international law of priority of discovery and occupancy, are the proprietors of the soil? This will not be credited by any one who is familiar with the history of their intercourse with the natives. The treatment of the Indians by our own government, and by that of Great Britain, has often been contrasted by persons not understanding the subject, and conclusions drawn favorable to the latter, and damaging to us as a philanthropic and just nation; whereas the facts, in my judgment, go to prove a condition of things directly the reverse. Our government, for example, has invariably recognized the claim of the natives to the soil, and has uniformly purchased and paid them for it; and if our agents have not always proved honest, it has not been the fault of the government, and does not affect the principle. Our Congress, with the welfare of the Indians in view, has enacted laws prohibiting the introduction of spirituous liquors into the Indian country, and imposed severe penalties upon their violation; whereas the British government has taken their lands whenever it suited the purposes of their authorities, and paid them in return whatever caprice, interest, or policy dictated.

When the Hudson Bay Company's factors entered Rupert's Land, they found it peopled with numerous tribes of vigorous, manly natives, who were strangers to the effects of alcoholic drinks, and, in the primitive simplicity of their untutored natures, were prosperous and happy. But the advent of the Englishman upon their domain inaugurated a new era in their history. They were speedily inducted into the diabolical mysteries of the intoxicating cup; and these credulous children of the forest, with the instinctive proclivity of their race, eagerly imbibed the seductive fire-water, and soon became slaves to its pernicious influences; and, from that day to this, spirituous liquor has constituted one of the chief articles of their traffic. To such an alarming extent have the Indians become addicted to the use of this poisonous stimulant, and it has wrought so rapid a diminution in their numbers, that now there are but

a few miserable remnants left of what were once powerful tribes. They have degenerated into the very decrepitude of barbarism. All this has been brought about with the knowledge and sanction of the very people who now have the audacity to charge us with cruelty and injustice to the red man. Bah! Such barefaced hypocrisy only serves to delude those who are ignorant of the history of English civilization—or, more properly speaking, English *annihilation*—in India, in China, and in British North America.

The British authorities, in opposing immigration into the territory of the Hudson Bay Company, have been actuated by a different motive from that of any special regard they entertain for the welfare of the aboriginal race; and that motive is nothing more or less than the perpetuation of the trade of a powerful monopoly, which thereby has been enabled to barter its wares for a few paltry beaver and musk-rat skins; while we, on the other side of the boundary line, in the brief period of five years, have not only populated several adjacent new territories, but have spanned the continent with one railroad, and have several others in rapid progress toward completion.

That the ponderous optics of our lethargic cousin, John Bull, are at last beginning slowly to open upon the importance of this subject the following quotation from a sensible pamphlet, published at London, in 1866, by Thomas Rawlins, F.R.G.S., author of "America from the Atlantic to the Pacific," most pointedly indicates. He says: "To the directors and stockholders of the Hudson Bay Company we would say: The emigrant is even now thundering at your doors; he demands a passage; he asks by what right you exclude him. Why have you not borrowed a lesson from the progress of the country adjoining? Are you blind to your own interest? for, if you continue to pursue your present policy, you assuredly will be. *Brother Jonathan possesses a capacious maw. He is snuffing the savory morsel of the Fertile Belt; but once let him get a few Squatters' Rights, and there will soon be no necessity for any action on the part of the Board of Directors. Their power will have slipped from their grasp, and the road to the Pacific be shut out to us forever. We must not, we can not, permit such suicidal lethargy to continue. We are all interested that unless something is done soon, the connection between the Atlantic and Pacific coasts in English interests is irretrievably severed, and the supremacy of British power in North America will be greatly endangered.*"

The somewhat equivocal compliment paid us in the gastronomic figure above quoted is eminently characteristic of the nationality of the writer, and exhibits the true measure of John Bull courtesy and amenity; yet it contains an admission regarding the relative enterprise of the two nations which I should hardly have expected from an Englishman. It must be conceded that the gloomy picture of the future which he

so earnestly exhibits to the serious contemplation of his countrymen seems almost prophetic; and, indeed, we may truly say that it has already been partially verified.

The fact is indisputable that "Brother Jonathan," in his voracious absorption of domain, has proved himself to be something of a gourmand. That he has been blessed by Providence with a "maw" of respectable proportions, an excellent appetite, and capital powers of digestion is beyond question; moreover, his keen olfactories certainly *do* enable him to "snuff" from afar the aroma of a choice *bonne bouche* in the form of auriferous or agricultural territorial acquisitions; and, although he has of late been a little cloyed with racy viands of this description, yet no dyspeptic symptoms have as yet appeared; and I have no doubt if the piquant "morsel," so graphically and temptingly depicted above, were properly served up and placed in his mouth, he might manage to swallow it.

Should the North Pacific Railroad, or either of the two railroads from St. Paul, be extended on from near the head of Red River across the elevated plain of the Coteau du Missouri, south of Devil's Lake, the road would run entirely within the limits of our own territory, and would have the most direct bearing for its Pacific terminus; and the face of the country here is smooth, without any very heavy grades; all of which are important considerations. But this line traverses some three hundred miles of elevated tableland east of the Missouri River, upon which are, only here and there, at very wide intervals, a few sticks of wood, and a scarcity of water. This plateau is from two to eight hundred feet above the adjacent country, from twelve to eighteen hundred feet above the ocean level, and covered with short grass; but, with the exception of a minute fraction along the borders of the few small streams, it is not arable. Besides, a considerable amount of snow falls upon these bleak plains, and the fierce driving winds cause it to drift greatly, so that it is very difficult and unsafe traveling in midwinter. For example, during the winter of 1867-68 there was so much snow here that the mails could only be carried between some of the military posts upon dog-trains, and several men lost their lives in this perilous service.

If, on the other hand, the railroad should be carried down the valley of Red River to Fort Garry, and thence up the valleys of the Assiniboine and Saskatchewan, it would pass through a lower and more sheltered section, nearly all of which is tillable, and would in all probability soon be densely populated up to the very foothills of the Rocky Mountains, which are here less than 400 miles from the Pacific terminus.

It does not, in my humble judgment, require the premonition of a prophet to discern that an achievement of such magnitude as this would contribute vastly to the mutual benefit of the United States as well as England. All inter-oceanic transit over this route would necessarily pass for several hundred miles upon our

roads; and I am unable to resist the force of my own convictions that the international affinity and the moral cohesions which would inevitably result from such a community of interest, and which would be cemented and consolidated by mutual advantages of a commercial, social, and political character, would speedily achieve miraculous results in developing the endless resources of the great Northwest.

Until within a few years past the authority of the Hudson Bay Company throughout the entire limits of their vast domain, from Canada to Hudson Bay, and to the North Pacific and Arctic oceans, has been as potent and unlimited as that of any absolute monarchy in the universe. Their officers have exercised all the functions of an independent government, having parliamentary, judicial, and executive branches, which have enacted, interpreted, and executed laws with as unquestioned immunity as if they were components of a veritable *de facto* nationality.

Invested as this association was by its charter with such extensive privileges, and armed with powers so absolute, it is not surprising that its officers should have maintained for 114 years a domineering control over every body within the limits of their territory.

Financially the operations of the Company have been attended with marked success. From its first organization the dividends increased until, in 1664, the stockholders received 50 per cent. upon their capital; and from 1690 until 1800, a period of 110 years, the annual dividends amounted to from 60 to 70 per cent. An idea may be formed of the extent of their business from the fact that, about the beginning of the present century, it was not an unusual circumstance for 3000 of their traders to be assembled at one time at the Fort William dépôt on Lake Superior.

At one period in the history of this powerful and sagacious association (1784) a formidable rival was organized at Montreal, under the designation of "Northwest Fur Company," which sent out its traders over every part of the country wherein the other association claimed exclusive privileges in virtue of its charter; and the operations of the new company were so amplified that they even sent ships around the Horn to British Columbia, and employed as many as 5000 men at a time.

This encroachment upon what the Hudson Bay Company claimed to be their legal rights materially lessened their dividends, and incited them to resist the intruders, and attempt to expel them by force from the country; and this ultimately engendered so acrimonious a feeling of antagonism between the employés of the two companies that it culminated in war to the knife. They fired upon each other without hesitation whenever they met, and many lives were sacrificed in these encounters.

This state of things continued until 1821, when the Northwest Company surrendered its

opposition by merging its destinies with its rival. Similar unsuccessful results have uniformly attended the efforts of the American Fur Company, of Mr. Astor, and other independent traders, to compete with the Hudson Bay Company; especially upon the Pacific slope of the mountains, where their practice has been to send their traders into close proximity with all competitors, and undersell them to such an extent as to prevent them from realizing any profits, and thereby compelling them to abandon the trade.

It is only a few days since that I was informed by a gentleman of unquestionable veracity, who has occupied the high position of United States Senator, and who at one time was at the head of a fur company, that, during his administration, it was the habitual practice of the Hudson Bay factors to send their traders to points along the boundary line nearest his establishments, and draw off his trade with our Indians, by underselling him, and by the still more powerful inducement of ardent spirits, which our laws prohibited him from vending.

The exclusive monopoly of the fur trade, as well as the arbitrary domination and rule of the Hudson Bay Company, culminated about twenty-five years ago, and has been on the wane ever since; so that now independent traders go into their territory without much molestation. And the authority of their officers is not only questioned, but occasionally resisted by force.

A short time previous to my visit at Winnipeg, the jail at that place was thrown open by the populace, and prisoners who had been immured within its walls, under the decrees of the Company's courts, were set at liberty.

The association has a banking establishment at York Factory, where it issues notes, redeemable in coin at its house of business in London. This currency circulates generally throughout the settlements, but seldom passes over the boundary line.

What is to be the ultimate issue of the present complication of affairs upon Red River can not, as yet, be determined. It is presumed, however, that much will depend upon the action taken by the British and Canadian authorities, who will be unable to take troops from Canada over the Lake Superior and Lake of the Woods route, with any certainty of their reaching Red River before about the last of June.

Governor M'Tavish, in 1868, expressed to me the opinion that the citizens of Rupert's Land, in the event of their political connection with the government of the Hudson Bay Company being severed, would prefer remaining as a separate colonial dependency of Great Britain; but rather than be annexed to the distant Dominion of Canada, he believed the majority of them would gladly avail themselves of the alternative of linking their destinies with the United States.

JAMES FENIMORE COOPER.

WHEN these poor straggling locks were brown,
 And these dim eyes were bright and bold,
 I sung of him, my country's pride,
 Who woke the jousts of old.
 I stood in fairy Abbotsford,
 By Dryburgh's crumbling ruins gray,
 And sigh'd above the cloister'd vault
 Where good Sir Walter lay.

And now when thirty chequer'd years
 Have brought me to a foreign shore,
 I stand beside Otsego's lake,
 Less ardent than before.
 But the deep feelings of my prime,
 Though long repress'd, still inly burn;
 And as I tread through Cooper's haunts
 Youth's impulses return.

"Ho, stranger! thou must know *his* grave,
 Who here his race immortal ran;
 Canst guide me to the sacred spot
 Where sleeps that kingly man?"
 The keen-eyed rustic, looking up
 With kindly greeting, gave the nod,
 And, leading through the grassy field,
 Points to the hallow'd sod.

"See," he exclaim'd, with kindling cheek,
 "Yon pile that crowns the hillock's rim,
 To tell the pilgrim from afar
 How proud we are of him."
 My glance took in an obelisk,
 High towering near the solemn wood,
 Where Natty Bumppo's stalwart form
 In lifted grandeur stood.

Careless his hand the rifle grasp'd,
 That weapon known throughout the world;
 And, crouching at the hunter's feet,
 His faithful hound was curl'd.
 "And there is where the panther fought
 With Brave" ('tis now a shaven lawn);
 "Where Lizzie Temple scream'd, as swift
 The fatal bead was drawn."

The garner'd memories of years
 With wild emotion o'er me pass'd;
 It seem'd so strange to realize
 That here I stood at last.
 My thoughts went back to days of yore,
 When o'er his vivid page I hung,
 As dreams of dark primeval woods
 Across my soul were flung;

Of toilsome marches, Indian camps,
 And searches for the vanish'd trail;
 Of tomahawks and bloody fights,
 War-whoops and woman's wail;

Of birch canoes down rapids whirl'd;
 Of white cascades that ceaseless pour;
 Of beavers, elks, and murmurous bees,
 And Niagāra's roar;

Of prairies vast, where countless herds
 Of bison thunder'd o'er the plain;
 Of Pawnee warriors on the scout,
 And Gamut's solemn strain;
 Of Uncas and the Sagamore;
 Of Hurons stalking, single file;
 Of Cora grave, and Alice bright,
 And Magua's subtle guile;

Long Tom, "the may-pole mariner,"
 Too faithful to the treacherous oak,
 Whose timbers, scatter'd on the wave,
 His simple spirit broke;
 Paul Jones, the daring renegade,
 On that mad night he sought his home,
 Lifting the *Ariel* through the shoals
 Between the crests of foam;

Of fair Eudora, peerless maid,
 And Mabel, Hawkeye's promis'd boon;
 Of Arrowhead's meek Indian wife,
 The timid "Dew of June;"
 Lithe Jasper, with his paddle swift,
 Quick to detect the Mingo signs;
 Sage Tamenund of many days,
 The Nestor of the pines;

The "Rover" and the "Water Witch,"
 Of nautical manœuvres rife,
 Their frolic in the sunny hour,
 Their manhood in the strife;
 The "glorious city in the sea,"
 Where sad Jacopo plied the oar,
 And swept his sable gondola
 Along the Lido's shore;

The "Lion's Mouth" of grim Saint Mark's;
 The "Three" in council met for doom;
 Pure Gelsomina's light of love,
 Gilding a dungeon's gloom;
 And Esther's wail o'er Asa's bier;
 The tell-tale bullet shown the band;
 The cowardly Abiram's fate,
 Dropp'd by a brother's hand.

Creations matchless, manifold!
 Let kings for mortal lineage strive;
 But *these* the common lot defy:
 His offspring all survive.
 Yea! and they shall; the coming crowds,
 When valley clods have press'd our brow,
 Shall see those creatures (not of clay)
 As fresh as we do now.

Strange that the day-dreams of Romance,
Phantasmal forms of man's device,
Endure, while God's own image melts
Like fast-dissolving ice!
No spirit through their nostril breathes,
No subtile ichor fills their veins;
But still the insubstantial throng
From age to age remains.

To these serene realities
We are but shadows on the wall—
Scarce born to light ere snatch'd away
Beneath Oblivion's pall.
O plastic art! thy spell alone
The palm and fadeless amaranth gives;
The sculptor falls, the statue stands;
Sterne dies, but Toby lives.

I gazed upon the placid scene,
So haunted of the Western muse,
Where the great Poet of the Woods
Oft brush'd the morning dews,
And felt how blest his days had been,
How kind his Maker's gracious plan,
When fitting for his work robust
This "castle of a man."

Deem him not stern, imperious, proud,
Estrang'd from love and kindly ken,
Because he scorn'd the little arts
And ways of little men.
And if, at times, indignantly,
He spurn'd the miscreant from his sight,
Too often venial error found
His bark worse than his bite.

The cinnamon is rough in rind,
But turn the gnarl'd wrappings o'er,
And out the pure aroma flies—
What sweetness at the core!
It was his fate to cope with those
Who chafed, impatient of his might;
And if his calls to war were loud,
The impulses were right.

With patriot zeal and courage high
He faced a people in the wrong—
Bear witness those who felt his stroke
That it was wondrous strong.
He gave to critic-craft a cuff
That transatlantic cousins shook—
Effectual answer to the sneer,
"Who reads a Yankee book?"

What distant clime will Envy name,
Where rifles crack or navies float,
In which the roving Pioneer
His fame has gather'd not?

The English boy feels, with a thrill,
His moccasin among the leaves;
The maid of Norway hugs his page
On stormy winter eves.

The Northern Pantheon extends;
The Twilight of the Gods comes down;
And Odin's sun-bright hall is dimm'd
By dark Wahcondah's frown.
By Bagdad's toppling minarets
The Dervish adds, with inward glee,
Our Sindbad's stories to his own
Weird wonders of the sea.

Deep in Arabian wilds are found
His pictures of the forest green,
And in Brazilian solitudes
His stately steps are seen.
Where the pomegranate and the peach
In Persian gardens tempt the bird,
The flavor of the hickory nut
Comes at his simple word.

Old Leatherstocking's silent laugh
Has spread its soft infection wide—
Delights the dwellers on the Nile
And by the Ganges tide;
Glints on the bonny "Links of Forth,"
And where the craggy Grampians stand:
The light of Cooper's genius fills
My own illustrious land.

The massy organs of his thought,
The strong hand that the pictures drew,
I know, as downward sinks my glance,
Are vanish'd from our view.
So may the language he enrich'd,
Like that of Greece and Rome, decay;
The dusky race he help'd to raise
In time may fade away;

And tongues of unimagined tone
In other cycles yet may be,
When continents, unheav'd as yet,
Break from the soundless sea;
But *there*, transfus'd and mirror'd strange,
Perchance with myths of quaintest grace,
The red man's legend, faint and dim,
Shall antiquaries trace.

How peaceful were thy closing years,
How sweet that autumn Sabbath day,
When, all thy toil and conflicts o'er,
Thy calm soul pass'd away!
Away o'er Life's sublimer Deep!
But thou hadst conn'd the Chart before,
And, ready at the Pilot's call,
Loos'd for the "shining shore."

THOMAS C. LATTO.

Editor's Easy Chair.

IT certainly is not the fault of New England that it is not New York, nor of New York that its lustiest defamers of New England are New Englanders. If you happen upon a gibe at the Yankees, the probability is that it was written by a full-blooded Biglow. And the unhappy point is that he and his kind half justify their own sneers. A mother who bears and rears such children may almost seem to be worthy even their contempt. Their conduct is explained by their desire to propitiate their new masters. But luckily the Arnolds are always as thoroughly despised by those whom they serve as by those whom they betray. A little fellow comes from New England to New York and squirts his feeble venom upon the granite hills. But they do not melt, while those for whose pleasure the feat is performed only laugh at the little harlequin.

Yet the two cities hold aloof. Each has its own view of the other. In the ancient days, when the Easy Chair, making the grand tour, came to Vienna, it heard the new opera of "Martha," and Vienna was delighted. Presently it went to Berlin, and again heard the pleasant opera. Flotow, the composer, himself directed. "Pooh," said Berlin, "'tis very pretty dancing music, quite fit for Vienna." And the solemn city on the Spree—for it is an exquisite joke to a foreigner that the grave, high-stepping Prussian metropolis is always on the Spree, a joke which is the more comical because no Prussian can understand it—Berlin, we say, turned from the dancing music of Flotow to its stately delight in Bach. But because Berlin is solemn, shall there be no merry music? And as for New York, it is useless to talk of centralization while Boston holds out so bravely. New York treats it very much as a king treated the baron whom he could not despise. And what a city of refuge each is from the other! Theodore Thomas delights New York unchallenged with his "dancing music" at the Central Park Garden. When he goes to Boston it crowds to hear him: it praises his orchestra immensely, and then—that the line may be drawn—regrets that he plays so much trivial music. Fechter acts in New York, which lifts its doubtful eyebrows at him, then slips off to Boston and is revenged by "an ovation."

This little friction is delightful. Goethe always said that it was better for Germany that there should be several small capitals, centres of cultivation and high civilization, instead of one great, blighting Paris that would leave all the rest of the land desolate. If the jealousies could only be kept within bounds, they would serve, he thought, merely as healthful irritations. A federation of small states, in every small state a city with a court and all the refinement that clusters around it, was evidently the ideal upon which his mind was fixed. And who now complains that there are so many centres to the fatherland? How much better are Dresden, Weimar, Berlin, Stuttgart, Carlsruhe, Munich, Hanover, Vienna, and as many more separate cities, than they would be rolled into one vast metropolis! This difference is a spice we can

not spare. What well-regulated New Yorker does not enjoy his gibe at Boston, or what Bostonian could yield his polite tolerance to New York? Nothing is pleasanter than to feel, as you watch an artist struggling for recognition in one place, that he will secure it in the other. If his bark sinks, 'tis to a deeper sea. Shall we say, for instance, Mr. Fechter?

Mr. Dickens is usually a very shrewd man, but it is doubtful if he showed his usual sagacity in writing an article to introduce Mr. Fechter to this country. It was generous to seek to cover his friend with the mantle of his own prestige, and the story which has been told in regard to it, prejudicial to Mr. Dickens, may be very safely classed with the myriad other falsehoods with which the air hums. But there was an instant reaction against the kindly introduction; and that air of severe determination to "judge the man upon his own merits," which often suggests that the man has been partially prejudged before his merits have had a chance to display themselves. There were also the skeptics who said that if Mr. Fechter were a great actor there was no need of blowing loud blasts of praise in advance. Nothing, they said, is so soon discovered as good acting, and we know it, Mr. Dickens, when we see it. It was most generously meant; but the puff preliminary is always perilous to the subject. When a lady, for instance, is introduced to an audience as the Wendell Phillips of her sex, or another lady as the Anna Dickinson of the West, the greatest injustice is done to them by challenging comparisons. A vague expectation is at once excited, and an admirable performance may seem to be a failure because measured by a visionary standard.

Mr. Fechter played in New York, and there was instantly a very great difference of opinion upon his merits. But he can not be said at any time to have "taken the town." There was a most energetic debate. One young person sighed to think that in this uncertain world something might happen before Friday evening to prevent her coming again; while another young person rather regretted the evening which had been devoted to Fechter's *Ruy Blas*. Instantly, also, he was tried by the standard of a favorite resident player. The point of interest seemed to be whether he were better than Booth, a very vague inquiry, but none the less zealously urged. Indeed there was a kind of partisanship, felt rather than expressed, and the warm praise of one actor was taken as indirect depreciation of the other. But it was, as usual, entirely unnecessary. Good wine needs no bush—whether it be Burgundy or Tokay. The art and skill of Mr. Fechter and of Mr. Booth do not need to be set off against each other to be truly appreciated, and certainly the excellence of Mr. Fechter will not be denied by the firmest friend of Mr. Booth. The moment Mr. Fechter appears upon the stage it is evident that here is an actor thoroughly self-possessed and master of all that is technically called business. The perfection of his art is seen at once in his mastery of his movements and attitudes, and his entire absorption in the part; and from the nature of his talent and the

characters that he selects, it is presently very clear that his chief excellence is probably in the modern romantic drama.

What an exquisite absurdity the romantic drama is, and how delightful to behold, who does not know? "Ruy Blas" is a specimen; the "Lady of Lyons" is another. The "Duke's Motto," which the Easy Chair has not seen, it hears is not less pleasant in the same way. Lady O'Loony is always the heroine. She is first cousin to a countess; she works embroidery, and of such is the kingdom of heaven! Bombastes, in greater or less degree, is always the hero. The marble palace always gleams, in these ravishing dramas, through lustrous trees upon the shores of Como. Indeed they seem to have been written by Mr. Disraeli; there is so much duchess and castle and heiress and cardinal virtue blended with aristocratic descent. You leave common-sense at the door. Certainly fairy-land is cheap at two dollars a ticket. And of course you accept the scene upon its own terms. If, as Charles Lamb said of the artificial comedy of Congreve and Company, that it was beyond the domain of conscience, this surely is a realm beyond that of reality or experience. It would be as pretty a folly to try such a play by the ordinary canons of probability as it would be to submit to the same ordeal the first tenor warbling his dying breath away in "Lucia." What the spectator says is, that if there ever could be such scenes and such persons they would probably look like this, and behave in this manner. They are judged by the proprieties of the supposition.

Of course nothing can be more artificial than the dramas in which Mr. Fechter prefers to play; and his instinct must be accepted as the key of his talent. Of course, also, in the romantic drama of this kind the histrionic art is not pure; the effect, that is to say, is not due to the acting alone. It is composite. The accessories are hardly less important than the actors. The results are due to the skillful combination of action, picture, and music. The pathos of the most touching scenes is not intellectual, as it evidently was in the acting of Garrick, of Kean, of the elder Booth. It is partly that; but it is largely, also, sensuous and sentimental. The subtle introduction of the orchestra is essential. The player speaks to music; but, to a musically sensitive mind, from that moment it is the wailing minor chords of the instruments that are most powerfully affecting. The Easy Chair is not complaining; it is merely describing. When, at the close of the third act in the "Lady of Lyons," Claude Melnotte kneels at the table, and the lady waves her hand as she withdraws, in recognition of his humanity—for it is nothing more—and the curtain falls amidst the sweet, muffled murmur of the orchestra, we all heartily applaud; but what moves us is certainly not merely Mr. Fechter's acting, excellent as it is.

What a delicious absurdity, let us repeat, is this romantic drama! And the "Lady of Lyons" is the most admirable illustration of it. Its folly is inexpressibly Bulwerian and delightful. Yet, while we laugh, and especially while in the newspapers we mercilessly expose its fustian, and show how gently ridiculous it is, in the hearing and the seeing it is very agreeable. Probably the extreme artificiality of all the circumstances,

the theatre itself, the necessary incongruities and absurdities of any play, the confusion of mind as to what really ought to be expected, and by what canons it should be judged, induce the necessary frame of mind—if, indeed, the mind has any thing to do with it. We all know what pleases us, what affects us; but who knows what good acting is? Listen to the Fechter audience commenting, and learn how the wise differ!

The curtain has not yet rolled up, and we are all busily chatting and watching our neighbors. How pretty the costumes are, and what an astonishing number of pretty women are clustered all about. This also is fairy-land before the curtain. Here are towering mountains and deep valleys of hair high poised upon the table-lands of lovely heads; baskets, also, for hats, and neat table-mats for bonnets. Think of the ancestral calash and coal-scuttle! Then is it not true that lovers and young married people are fond of coming to the play? Don't they occupy a great many seats? And when, between the acts of the drama, the Easy Chair exclaims, with inexpressible delight to its neighbor, "Dear Aunt Plumper, this is what Reginald calls 'the bang-up thing!'" does not Romeo, who is sitting immediately in front, glare round upon this venerable furniture as if it were a blasphemous monster? Does it never seem to you that the murmur before the orchestra begins is the soft sound of innumerable doves billing and cooing? And when the play opens, and the brave Alonzo scales the castle wall, and leaps the fathomless abyss, with the fair Imogen lying senseless in his arms, and turns upon the brink and shouts to the pursuer, "'Sdeath, miscreant, I defy thee!" is there an old heart so hardened that it does not feel the thrill of all the young hearts around it, which know that they also defy all the miscreants who would dare to dream of insult to a certain angel there present, with somebody else's hair at the back of her head?

However, we are here to see Mr. Fechter, and not to study the episodes upon the seats about us. And the orchestra is beginning. Dear, dear! Aunt Plumper, what *is* that music? Tum-ti-tee! Tum-ti-tee! It's perfectly familiar, and we can not think what it is. But suddenly all the instruments flow together into a bright, ringing melody—of course, "Massaniello." And there goes the curtain! You say that in Boston they said they thought him as fine as Regnier and Sampson at the Français? Well, in New York we shall venture to hear and judge for ourselves. The curtain rises, and our interest is demanded for the young son of a French gardener at the close of the last century, who has accomplished himself in many ways, and who contrives to send some of his verses to the hands of a young lady of Lyons, the daughter of a merchant, whom the peasant romantically adores. She declines to receive them, and the messenger who brings them is even beaten as he is turned away from the merchant's door. "A French citizen has received blows," says the messenger. And forthwith the poet tears his verses which have been scorned, scatters the bits of paper, and informs his mother that he so drives the disdainful beauty's image from his heart. To him then, in the very nick of time, enter villain number one in the necessary black hat of villainy, and weaker villain number two in a white hat. "Re-

venge, revenge!" cries Black Hat. And the accomplished son of the gardener listens eagerly, and the hero for whom our sympathy and admiration have been invoked consents to the most rascally deceit and betrayal of an innocent girl who has rejected his verses.

The Easy Chair is telling the story for the benefit of those who are not familiar with the romantic drama. So the young man is introduced into the lady's family as the Prince of Como, and the rest follows. The hapless girl is married, and Claude brings her to his mother's house, where a tremendous scene takes place. The young man has come to himself, and is full of anguish, and tells the Lady of Lyons that the law will not condemn her to be the victim of a foul conspiracy. And she retires, in a grand tableau, to slow music. The youth outwatches the bear, and resolves to send word to her parents with the early dawn, and then to depart and retrieve his name. He goes off upon the first part of this excellent errand, and during his absence Villain in the black hat arrives to beg her to escape her horrible fate by accepting him. Immediately there is another tremendous scene, with fiendish attempts at osculation, ending in the sudden entrance of the youth, who scornfully waves Black Hat away. Then arrive father and mother, and cousin Damas, colonel in the French army, who has suspected something all the time; and after a series of passionate ejaculations the lady goes off with her parents, and the young man with the colonel to the army.

In two years he is the hero of Lodi number two, and returns to Lyons just as his wife has consented to be divorced to marry villain Black Hat, who makes her hand the condition of his saving her venerable father from bankruptcy. There is a final scene, in which she talks with the young officer as a supposed friend of her husband, and it is perfectly clear to him that she now loves him for himself alone—apparently for no other reason than that he would not take advantage of her betrayal into marrying him—and the late gardener's son, now Colonel Morier, and the friend and favorite of General Bonaparte, immediately tears the papers that have been signed, counts out the necessary bank-notes upon the table, explodes in a volley of rhetoric, which is wholly unintelligible, and the curtain comes down; and we clap and thump and insist upon seeing our friends before the curtain, and when they come we clap and thump all the more, and have had a very pleasant evening. There has been a great deal of Bulwerian apothegm during the play. And as that prodigious line in Richelieu, "Put up the sword, states can be saved without it," used to produce frenzies of applause in the winter of 1860-61, so some noble line in this play, which declared substantially that no law, human nor divine, should separate a wife from her husband, evidently delighted some of us who made a most approving noise in response.

This was the picture of life which was offered to our thoughtful consideration. But having left the actual and the probable at the door, none of us were disturbed. Indeed, it is ridiculous for those of us who sit gravely through three acts of an opera to refine upon the romantic drama. It was undoubtedly preposterous; but Mr. Fechter showed in it the utmost feeling, refinement,

elegance, grace, and sentiment. He is in constant action, and his voice is set in a high key; so that in the first scene of this play his restless movement and play of feature, with the tone of his voice, gave the effect of a high wind. But there is a vigor and raciness in his manner, and a propriety of action, which are fresh and delightful. His pronunciation, although peculiar, is not disagreeable; but in passionate climaxes it is impossible to understand him. The actors with whom we are all most familiar in this country follow the British traditions. But Mr. Fechter has no trace of them. This, possibly, explains what is felt to be the strangeness of his Hamlet. We have been so accustomed to the John Kemble and Sir Thomas Lawrence Hamlet, that we do not readily conceive any other. Unfortunately the "Lady of Lyons" was substituted for "Hamlet," on the very evening that the Easy Chair and its amiable friends repaired to the play, so that they missed the pleasure of comparing Mr. Fechter with other actors of the part. Yet, if they had all been actors, they could have had for thoughtful care, for elaborate art, for dignity and propriety, and for a certain vital force, no better teacher than Mr. Fechter. And if New York was cool, they are glad that Boston was warm in its welcome and appreciation.

DE TOCQUEVILLE says that when we Americans look in the glass we see the Vicar of Bray. He does not make use of those precise words; but whenever there is any great public excitement in this country upon what may be called fundamental questions in morals or politics, there is always occasion to remember his unqualified statement: "Freedom of opinion does not exist in America." It is to his countrymen also that we owe the significant phrase, "the courage of your opinions." But this is only another form of the English definition of heroism, the ability to be a minority of one. De Tocqueville's book upon this country suggest a striking illustration of his own remark. Few Americans who saw their own country with its character and tendencies as plainly as he would have dared to write of them as plainly. And how many of us care to acknowledge that while we are willing to vociferate our contempt for the effete despotisms of Europe, we are equally anxious to propitiate the vigorous despotism of America?

If you read the speeches that are made in public meetings, or the public letters that are written by public men, you can hardly help detecting the melancholy tone of insincerity. The orators don't think exactly what they say, but they know they are expected to say it. Their success demands that they shall not shock public sentiment nor outrun public sympathy, as it is called. The most sagacious statesman, of course, in this view, is the man who apprehends a readiness in the public mind to change, and who seizes the precise moment to declare himself; the moment, that is to say, when a multitude are waiting for a leader, and instantly follow. He shakes the branch from which the fruit is ready to fall. All progressive movements in society proceed, therefore, from the exceptional persons who are not afraid of that attenuated minority, and who can see the king as clearly when every body laughs at his claims as when the whole world is

kneeling before him. The difference between such persons and the others is that they love the king and the others themselves. They love him because he is royal, the others because he can be of use to them. This is the class of the Vicar of Bray; but nobody very much respects that pastor. The Vicar of Bray is the gentleman who is popularly believed to know which side of his bread is buttered. But it sometimes occurs to the Vicar himself that man does not live by bread alone.

But if we do not very much respect that pastor, we generally imitate him very closely. Indeed, the severity of our judgment upon him is curiously suggestive of Sir Roger de Coverley's sudden waking up in church, and immediate sharp rebuke of those who had dropped asleep. When we hear our own round abuse of the Vicar, do we never think that we hear the old charge of the Pot against the Kettle? Do we complain of trimming, dear brother Trimmers? Is it drowsiness which we sleepers can not approve? It is certainly a very sad spectacle, that of a man who is afraid to express his own thoughts, not because they seem to him trivial, but because they are not the thoughts of other people. But it is a much sadder spectacle to see him attacked by other people, if he does dare to speak, because his opinions do not conform to the received standard. And it is this disposition to attack which causes the imitative tone which is remarked in so much American performance of every kind. To dare to differ is the chief heroism of our time.

And it is heroic, for it is not easy to bear the penalty of that daring. If, dear Madame, it is hard to be a little out of the fashion in your bonnet and dress, think what it is to be out of the fashion in grave doctrines of life and duty! You say, perhaps, that if a man's conscience is clear, he need care for nothing else. Try it, my dear Madame, try it! For instance, you declare that you despise the Vicar of Bray, who always tried to swim with the current, and always insisted upon agreeing with the dominant opinion. Why didn't he stick to his own, and take the consequences? Very well; try sticking to yours. You think, for instance, that Mrs. Grundy is a fool or a knave, and that no sensible woman minds her. Mrs. Grundy ordains that appearances shall be respected. You reply, in a perfectly decorous manner, "Appearances be hanged!" Mrs. Grundy, in accordance with her doctrine, orders that an unmarried young woman shall not go with a similarly unfortunate young man alone to the theatre, however intimate they may be, and although the theatre is the most public of resorts. Mrs. Grundy goes further. She ordains that a young man and woman who are engaged shall not take a journey together, nor lodge, however respectfully and innocently toward each other, at the same hotel, except under very pressing and extraordinary circumstances.

'Tis a whimsical sovereign, as the Easy Chair said last month. But such are some of her arbitrary decrees; and you laugh at them, Madame, and disregard them. You do not hesitate to take an innocent journey to Niagara with Don Alonzo, and you resent the faintest suggestion that there could be any thing improper in your traveling alone with the chosen object of your affections. So you do so—and instantly Mrs. Grundy breathes

upon your good name. Society, which is her court, suddenly buzzes about your ears and those of your friends. The meanest scandals, the vilest insinuations, the blackest lies, immediately crawl and creep and flap around you. Meanwhile you assert more vehemently than ever that Mrs. Grundy is a fool and a knave, and declare that no sensible woman minds her. And it is you and your conscience against Mrs. Grundy and all the world. Friends grow cool and drop off. You are stared at, wondered at, chattered at, and cut. Your very resistance becomes, in Mrs. Grundy's eyes, as she declares with upraised hands, conclusive proof of your brazen impudence and your unblushing effrontery. It is terrible. Your conscience is clear, but your life is necessarily saddened and clouded. It is a contest with a miasm. The daily drip of lies wears your soul away. But that drip is the penalty of holding to your own view. Now, the Vicar of Bray says that you had better yield and let the foolish world have its way. See how fat he is, how rosy! What a salary he has, and how he sleeps! Is the Vicar such a fool, after all?

De Tocqueville did not found his remark upon this private social tyranny of opinion, although he unquestionably observed what every thoughtful native sees, that there is less social freedom of opinion and practice here than elsewhere. Americans, for instance, don't yet dare to be poor. Few American young men—as a rule—have the courage to say "I can't afford to do that." There is a good philosophical explanation of this, unquestionably; but in practice it is generally cowardice. De Tocqueville meant that in public life there is no freedom of opinion. Every American is supposed to be a candidate for every office. We are all of the blood royal, and each has an equal right to the throne, and may be any day called to it. But it is only by the most sweet voices of our fellow-citizens that the call can be made; and if we tread on their toes, it is very clear that their tongues will not hail us king that shall be. To please the majority, therefore, is, according to the French critic, the necessary condition of political success in America. But to please them we must conform. Hence independence of thought and speech disappear, and the genuine American, in the more modern phrase, has an instinctive fear of a minority.

This fear is an immense demoralization. It is played upon for the basest of purposes. The Easy Chair, for instance, let us suppose, bent upon gratifying its malice against you, the Present Reader, studies the situation a little. It discovers that you are not quite regular in your attendance upon church, or that you have scratched a name occasionally upon the regular ticket of your party—or it discovers nothing of the kind. Thereupon it states, with profound regret, that Mr. Peter Piper's business is so vast and engrossing that he can not possibly dispose of it upon the working days of the week; or that the Honorable Peter Piper does not think it always his duty to vote the regular ticket. This is merely the way in which the victim is offered up to Juggernaut. Public opinion is informed that Peter Piper is a sinner, and it proceeds to judgment. The sad part of it is not that malice has excited stupidity, but that the victim himself suffers so horribly. It is the dismayed Vicar

finding himself on the wrong side, and in danger of losing his living of Bray.

It is this kind of tyranny that makes us all such bitter partisans. In our favorite paper, whatever it may be, every thing is treated indiscriminately. Every thing tastes of the familiar old pot. How is a reader, for instance, to ascertain the real state of things in another country, the tendency of opinion, the judgment of sagacious persons? His favorite paper has its philosophy, and has taken sides in advance upon all subjects. If it is radical in this country, with the significance that, under our circumstances, we attach to the word, it will be radical in Crim Tartary also. If it is conservative here, it will take the conservative side in the politics of Monaco. One paper has red spectacles, and the other green, and they always put on those stultifying glasses before they look at any thing at home or abroad. The reason is that the public opinion which supports the one journal expects to see things in general red, and that which sustains the other prefers that they should be green. To know is to obey. And the purveyors of news and criticism act accordingly.

It is akin to this that in no country is there greater terror of being thought to be impractical, or of being called so; yet it is only the impractical men and women who do the practical work, and every forward step is taken amidst a salvo of incredulous ridicule. Lady Mary Wortley Montagu introduced from Turkey into England inoculation for small-pox. If she had attempted to introduce the plague she could hardly have been more scornfully opposed. The faculty of medicine clamored against her, the clergy denounced her from the pulpit, the crowd hooted at her as an unnatural mother. Or consider the inventors. They are a visionary, impractical, often an impracticable class. If, hitherto, they had had the spirit of the Vicar of Bray, we should have crawled but a very little way from barbarism toward civilization. Columbus was a crochety adventurer who happened upon a continent. If America had been left to the finding of practical Spaniards, it might still have been sleeping upon the Western sea.

The application of this sermon is, that while it is very hard to stand alone in an unusual or an unpopular opinion, yet that it is often necessary to self-respect, and always essential to social progress. If De Tocqueville said truly that there was no freedom of opinion in this country, let us put him henceforth in the wrong. He might have said, if he had been a sneering Celt, which he certainly was not, that the pride of the Anglo-Saxons, as we call ourselves, is fair play; and then he could have added, that, in the society in which the genius of that race had most fully triumphed, fair play in opinion was unknown. Yet that is the last and highest success of civilization; and it is something that we can mark our progress toward it. When, instead of burning a man's body because his religious views differ from those of some other people, they merely call him names and send him to a moral Coventry, his fate has greatly improved. But when you reflect that his opinion is just as valuable and respectable as theirs, and that his fidelity to it is proof of his worth as a citizen of the world, you feel how cautiously we ought to describe our condition as civilized and enlightened.

WHETHER the New York musical jubilee will surpass the last year's renowned Boston festival of kettle-drums, church-bells, and cannon, is yet to be determined; but there are two, or perhaps three, societies of singers in New York which Boston has not yet equaled. They are the new Sacred Music Society, the Mendelssohn Club, and what has been known as the Madrigal Society. This last quietly began last year with one of the most delightful of concerts, which it has followed with half a dozen others not less delightful. Indeed it is hard to say when in this city any music has been rendered with more admirable art and skill. The Sacred Music Society has taken the field with great energy, and its spirit will carry it to success; but it must be a long time before it can have the same thorough training as the singers of the glees, madrigals, and choruses, who have now formed a musical society, reserving to themselves the choice of giving concerts in public or not, and of singing precisely the kind of music that they choose, and, indeed, of doing what they will. They will not confine themselves to madrigals. They will sing as many of Mendelssohn's magnificent choruses as they like. Whatever is quaint and lovely and of good report in the old music or the new they will not spare. Such license as they propose is delightful to think of, and its results will be delightful to hear.

The hall—it was Steinway Hall, and it is much improved since the Easy Chair once spoke of it slightly—was always full at the Madrigal concerts, and full of the best kind of audience. Every body seemed to have come to listen and to enjoy. There was an indefinable, an electric sympathy of appreciation in the audience. They had not the air of those who had come under any other compulsion than real desire; and the spontaneous and general and sincere applause was precisely what was to be expected. It was a well-mannered audience also. It was by no means necessary to say upon the bills, "Ladies and gentlemen are requested not to talk during the performance." But what kind of ladies and gentlemen *do* talk during a musical performance? This is a question which was presented to the perplexed mind by the invitations to silence which were circulated at the Sacred Music concerts. It was said that the audience upon those occasions was of the very best bred people in the city. And do *they* talk at concerts? Do the very best bred people in the city selfishly disturb their neighbors? Is an Easy Chair to understand that the people at the Madrigal concerts who did not disturb others were *not* well bred? Fashion is so eccentric that the question may be pardoned.

The singers also were pleasant to see. As one steady gentleman remarked, who would certainly have dealt very summarily with any losel talkers, they had an air of meaning business. And so did he. No subscriber to any entertainment this season has received his money's worth more fully than this sturdy gentleman. He enjoyed almost aggressively. He looked at you when an especially good madrigal or glee had been sung, with an expression that said: "Yes, you think you enjoy it, but you haven't the least idea of its excellence." And his eyes swept along whole ranges of listeners with that penetrating, half-defying, but interiorly contented look. He

knew that one person at least fully comprehended the excellence of the performance. Did he also know, probably, that the same person likewise furnished a very excellent entertainment himself? For he is still a tyro in places of public amusement who does not often find as much pleasure before the stage as upon it.

The great excellence of the concerts lies in the thorough knowledge and skill of the singers. They do not lean upon each other. Every one knows what he is to do, and how to do it; and if all the rest fell suddenly silent, he would go on to the end clear and undismayed. That is to say, that the singers are accomplished musicians, and this gives a precision, an intelligence, an exquisite detail of excellence to the general effect which is quite indescribable. The mass of sound is as delicately shaded as a mass of color by the most skillful master. Indeed, nothing was finer than the perpetual impression of reserved power. There always seemed to be a great deal more possible than was done; but what was done was all that was necessary. In some of the piano passages the effects were wonderful from the knowledge and confidence of the individual singers, and the easy and adroit handling of the conductor. The Greek choruses of Mendelssohn were superbly rendered; full, massive, solemn, delicate, the music was interpreted in a way that would have charmed the master himself.

Could any more civilizing work be done than

the association of lovers of this quaint and beautiful music for the purpose of its performance? The ladies and gentlemen who compose this society are private persons. But from their homes and separate studies they bring all this taste and accomplishment and skill to a general treasury, and for the public benefit. What a glimpse it opens into hundreds of homes made happy by this most refining of tastes! There was a certain domestic sincerity of impression in the whole which is very different from that produced by professional artists—a home flavor which was as delightful as it is novel. But although the Society is, in a certain sense, private, it should remember that it has no right to hide its talent in a napkin. Those who can produce such perfect and beautiful works of art as the Glee and Madrigal concerts have no moral right to refuse to show them. And they have seen how their labor is appreciated. They were lovers of music singing to other lovers. And the Easy Chair begs, on behalf of the listening lovers, that next year there may be a renewal of these memorable evenings in aid of the refinement and enjoyment of the faithful, if not of “the Wilson Mission.”

THE Easy Chair is sorry that it must defer until next month “A word to the Easy Chair,” from one who thinks “A word to contributors,” in the May Number of the Magazine, too hard upon those whose offerings are not found to be “available” for publication.

Editor's Literary Record.

THERE is nothing which requires or deserves more careful thought in its organization than a library, and there is nothing which ordinarily grows up with less plan, less definite purpose; and no part of the furniture of a house which is usually more absolutely worthless than the miscellaneous collection of novels, school books, popular histories, and miscalled religious publications which is usually to be found on the parlor shelves, or even piled heterogeneously on the parlor table, of those houses where sufficient literary life exists to demand any thing more than the provincial newspaper and the last magazine. If the father plans to have a garden, he does not drop in his seed as chance directs, nor buy it of traveling peddlers because it is cheap. He measures his ground, and adjusts, with some regard to the real or imaginary wants of his household, the useful and the ornamental, the permanent and the ephemeral. But he usually buys his books with no consideration at all, and no adjustment of the intellectual supply to the intellectual demand. His wife has a cookery book or two, and he an old volume on agriculture. These and his dictionary make a beginning. John must have certain school books. What the teacher requires the father rather reluctantly buys, with never a thought as to what is really the needed apparatus of the young scholar. Jane brings home every now and then a new novel. At Christmas an annual or two, all of whose merit is in the gilt edges and the tawdry binding, is added to the collection. Possibly somebody's history of the Bible, or a cheaply illustrated edition of Jose-

phus, or a volume or two of Spurgeon's sermons are obtained, under a vague impression that there ought to be some religious literature in the house. Every month or two an agent comes along with a volume which he assures the innocent housewife is the great work of the century, an assertion which, unfortunately for the honor and honesty of American recommendations, he is able seemingly to make good by the long array of names, D.D.'s and LL.D.'s, as well as journals literary, popular, and political, which unite in commending it to an unsuspecting and uncritical public. Sometimes impressed by his voluble confidence, sometimes to get rid of his wearisome pertinacity, sometimes out of charity for an invalid fellow townsman or townswoman who has taken to selling books because it affords “plenty of outdoor exercise,” she buys a book which may chance to be useful, but is quite as likely to be worthless; but which, at all events, is bought not upon any consideration of its utility, but upon the spur and feeling of the moment. At length the gathering pile of books becomes a nuisance to the man of the house, as it long has been to the woman. The baby uses them to build houses with, in lieu of blocks, and the next youngest thumbs the illustrated volumes somewhat assiduously. For the rest, they lie on the centre-table, when they do not spill over on to the floor, gathering dust, and making more trouble on sweeping days than all the rest of the furniture put together. The wife demands a bookcase. It is granted. The cabinet-maker sends one home; the heterogeneous mass of literary

rubbish is piled into it; the vacant shelves are filled up with old copies of magazines; and the household has its library!

Every man, so soon as he has a home of his own—and every man ought to aim to have a home of his own as soon after twenty-one as possible—should begin to lay his plan for the formation of a library. Five dollars and one afternoon's work in his own work-shop, if he has one, in his neighbor's if he has not, will suffice to give him shelves; and books never should be suffered to lie upon the table. He should next consider how much he can afford to spend for literature, how much of that he will appropriate to the ephemeral—the newspaper and the magazine—how much to the permanent, how much to general literature, and how much to his professional library. For the farmer, the mechanic, the merchant ought to have their professional library as well as the lawyer, the physician, and the clergyman. Then he should purchase his books systematically, buying not what is brought to his door, nor what happens to catch his eye in the illy-supplied book-store of his little village, where literature is represented solely by the two extremes of school books on the one hand and cheap novels on the other, but selecting his books from the great mass which fills the market, and relying, if he can not upon his own judgment, then on that of some literary friend. The criticisms of the daily journals and monthly magazines are not always of the most trustworthy kind, but they are always more trustworthy than those of interested book-agents and their careless and inconsiderate, though good-natured, indorsers. Nor is this advice intended merely or mainly for those men who expect to form a library. On the contrary, those who have plenty of money to spend for books can well afford to waste a little now and then on books that are worthless; and they who, without plenty of money, know how to economize at the table and in the wardrobe, that the mind may be well fed and well clothed, need no such counsel. We speak to those who buy books without thought, and who, if they were to make a careful account of all they have paid since last July for evanescent and perhaps useless literature, for books bought but never used, would be surprised to find that they had spent enough to give them the best cyclopedia that is published. The price of two good cigars a day will give, in two years, a complete set of *Harper's Magazine*, or the complete "American Cyclopedia," either of which is a far better library than most hap-hazard buyers accumulate in a lifetime.

AND this leads us to say that in the organization of a library the first purchases should be not of books to read, but of books to be referred to—a remark more true of small libraries even than of large ones. We will not go so far as to agree with Rufus Choate, who is reported to have said that he never read a book through; but it is certain that fifty dollars wisely expended in books of reference will give the household more useful information than a hundred and fifty expended in books to read. Swedenborg's library is said to have consisted of his Greek and Hebrew Lexicon, his Bible in the original tongues, and his own writings. Most clergymen would do well if they could exchange their collections of ser-

mons, bound quarterlies, and theological treatises for a Greek and a Hebrew concordance, Alford's or Lange's Commentaries, and M'Clintock and Strong's Biblical "Cyclopedia."

There lie now before us, as we write these paragraphs, four works which are of real value, permanent additions to our literature, the sort of books which, in our estimate, would come next to a good cyclopedia in the organization of a family library. Among these we perhaps hardly ought to include, however, what scholars will account the most valuable of them all, Dr. HENRY DRISLER's edition of *Yonge's English-Greek Lexicon* (Harper and Brothers). In the present utilitarian age, when even scholarly men begrudge the time given to the translation of Greek and Latin, we shall expect that most of our readers will regard the time devoted to Greek and Latin composition absolutely thrown away. "Who ever wants," we hear Mr. Gradgrind cry, "to write in Greek? Does any minister expect to preach to Greek congregations? Does any lawyer expect to plead before Greek juries? Does any merchant expect to have Greek correspondents? French or German might be of some use; but of what profit is it to write Greek?" Well, we plainly confess, Mr. Gradgrind, that there is not "much money in it." Measured by the utilitarian standard, Greek composition must be regarded as a purely professional study. But so regarded, it is not unimportant. Pitt translated the orations of Cicero into English, and rewrote them into Latin, twelve times, if we recollect aright, each time comparing his own Latin with that of the original. It was this exercise that gave him the wonderful command he possessed of the English language, and made him the most potent orator, as he was the most astute statesman, of English history. For the lawyer, the clergyman, the lecturer, the platform speaker, the statesman, Greek and Latin composition, especially the former, is not an idle exercise. There is nothing except a constant and loving familiarity with the best English authors that can do so much to make the student an orator, or at least (for, despite the famous proverb to the contrary, orators are not made) to give him a command of the instruments of his art. Nor can any one be said to be master of a language till he is able to express himself in it. We can not afford to forego the Greek, nor to ignore the scholarship which treasures it. So long as philosophy draws its inspiration from Plato, and Christianity finds the fountain of all its sublime truths in the writings of Paul and the words of Jesus, so long Greek will not be a dead language, nor one we can afford to bury beneath the sod. For the student of Greek composition Drisler's Lexicon—for so in reality it should be called—with Dr. Short's admirable essay on the order of words in Attic Greek prose, itself an invaluable contribution to the Greek grammar, and its translation of Pilon's "Greek Synonyms," is a perfect thesaurus of information, giving not only the Greek equivalent for every English word, but giving the equivalent in different dialects, and according to the usages of different authors. The student of this dictionary has, therefore, not merely an English-Greek Lexicon, but in it the apparatus for tracing the development and analyzing the differences of style in the different Greek writers. It would

have added greatly to the value of the dictionary for those who constitute the great bulk of Greek students in this country—the clergymen—if it had included, as it does not seem to do, the Greek of the New Testament, as well as that of the classic authors. But as it stands it is equally honorable as a monument to American scholarship, and valuable as an addition to our apparatus for critical study.

ALLIBONE'S *Dictionary of Authors* (J. B. Lippincott and Co.) has become already a standard which needs no commendation to any who are engaged in literary pursuits, or find in literature a favorite recreation. It is now nearly, if not quite, twelve years since the first volume was issued—a second edition of which is in course of preparation—and we have nothing but the intimation of the dedication as to when the third will appear. A single volume of such a work is sadly unsatisfactory; but if the editor has the patience to pursue his labors through the period of nearly a quarter of a century, we suppose his readers ought not to complain because of inevitable delay. To give the names and even a condensed biography of leading English and American authors would not require any thing like such a length of time. But Mr. Allibone has undertaken a very different task, one so Herculean as to be audacious. He has undertaken to give not only a list of the important works of each author, but an estimate of his writings; not Mr. Allibone's estimate either, but that which contemporary criticism puts upon them. This has involved a research through newspapers, magazines, and reviews, and a collating, comparing, analyzing, and selecting, which it seems simply incredible that any man should dare undertake, unless endowed with the physical endurance of a Samson, the patience of a Job, and the longevity of a Methuselah. However, this is what Mr. Allibone has essayed, and, so far, accomplished with wonderful success. It is true that we miss some names altogether from the collection, as that of Dr. Nast, for example, who, though his writings have been largely for the German population, yet deserves to rank among American authors. True, also, that some other authors are passed with too brief mention, or the articles upon them are not brought down to the present date, as is the case, for example, with William Morris, who disputes with Tennyson the right to the laureateship, and who is dismissed in two lines; or with Charles G. Leland, whose latest and most famous work, the "Hans Breitmann" ballads, is not mentioned at all. But this is perhaps incidental to such a work, in the preparation of which it must be simply impossible to keep pace with the progress of literature.

Concerning Dr. J. THOMAS'S *Universal Pronouncing Dictionary of Biography and Mythology* (J. B. Lippincott and Co.), we have nothing to add to the opinion we expressed a few months ago, except to say that the work, as it proceeds, fully sustains the promise of its opening number. It is indeed a complete cyclopedia of biography of both sacred and secular history, of both real and fictitious personages. And though it does not take the place of the fuller, though less comprehensive, dictionaries of special eras and subjects, as the Biblical "Cyclopedia" of M'Clinck and Strong, or the "Dictionary of Greek and Roman Biography and Mythology" of Dr.

William Smith, yet for the scholar, in haste to verify a date, or fix a single fact, the very brevity of its articles is a convenience, while to the general reader it contains, condensed in a paragraph, just the information he needs, and which he has not the time to condense himself from the more elaborate articles of special dictionaries.

Probably our readers will be somewhat surprised that we enumerate last, though not least, among the useful books for the family library, the *Dispensatory of the United States of America*, by Drs. WOOD and BACHE (J. B. Lippincott and Co.), the thirteenth edition of which lies on our table. To the medical faculty nothing more need be said than that this new edition is based on the new edition of the "British Pharmacopœia," and embraces material revision and considerable addition. But we are not writing for the medical faculty, but for those whose practice of medicine is confined to their own family. This volume is rarely to be seen except on the counters of the drug store, and in the offices of the doctors; and neither drug store nor doctor's office is often to be seen without it. But we have not such implicit faith in the infallibility of either physicians or drug clerks that we are inclined to take what the one prescribes and the other puts up without knowing something about its character, and its supposed effect upon the human body. It is generally worse than useless for any one but physicians to study pathology; since no man is competent, not even a physician, to interpret his own symptoms, or those of his family. But not only hygiene, but also therapeutics, ought to be studied, at least by every parent. Every mother is ordained of God to be a nurse; and every nurse needs to know not only physiology, not only the secrets of the human frame, but also something of the efficacy of those remedies which modern science calls in to adjust its delicate mechanism when disordered. The "Dispensatory" is a perfect cyclopedia of medicine. It is the authority to which every physician constantly turns to refresh his own recollection as to the virtue of particular drugs. And by aid of its index at the close, any one may learn, almost at a glance, the nature of the remedy he is taking himself, or is administering to others whose life is dearer to him than his own.

BIOGRAPHY.

DR. J. B. WATERBURY'S *Memoir of Rev. John Scudder, M.D.* (Harper and Brothers), is a valuable contribution at once to the literature of Christian missions and to the biographies of the great and good men who, by their labors and self-denials, have rendered every age "apostolic." Dr. Scudder's missionary labors in India were of an extraordinary kind; not only because they lasted so long, thirty-six years; not only because they were extended over so large a territory, being itinerant in their character; not only because they were genuinely apostolic in this that, being a regularly educated physician, he combined healing of the body with preaching to the soul, and made the physical relief he was able to afford the means of securing attention to the spiritual remedies he sought to offer; but no less from the intrinsic ability of the man himself, the genuineness of his devotion, and the unconscious cheerfulness of his self-sacrifices. Of him it might be written, as it was of his Master

—he “endured the cross, *despising* the shame.” His itinerant ministry in this country, if we may so characterize it, and his extraordinary success in interesting the young in the cause which enkindled his own enthusiasm, will give a personal interest to this story of his life. In fact, many of our readers will remember, doubtless, the Dr. Scudder who warmed their youthful hearts nearly thirty years ago, and will be glad to learn more of one whom they learned, perhaps, from a single address, to honor and to love. Dr. Waterbury, the brother-in-law of Dr. Scudder, has had those peculiar advantages which relationship alone imparts for writing this sketch. It is hardly necessary to point out special literary defects, or to criticise the principles upon which he has made his selections from the private letters and journals of Dr. Scudder, since, despite those defects, he has furnished what is not only the best, but, we believe, the only biography of one who stands deservedly among the first of the successors, not in lineal descent or ecclesiastical order, but in Christian spirit, of the first great missionary.

We are rather disappointed in *The Private Life of Galileo* (Nichols and Noyes). It gives a good deal of new information concerning the man, and affords what is almost a new conception of his private and personal character. It is impossible to honor very highly a man who taught publicly in the schools for years a system of science which in private he did not hesitate to declare false in fact. But the writer of this biography has committed a serious error in taking it for granted that the reader is already acquainted with the leading events of his life, and in passing by such incidents, for example, as his demonstration at the leaning tower of Pisa of the falsity of the Aristotelian philosophy with the merest reference—a reference which requires for its comprehension the examination of some other life. The author should have made his work complete in itself. Its tantalizing references to facts assumed to be within the knowledge of the reader greatly impair, if they do not destroy, its value as a biography for those who wish, in a single work, to get a connected view of the great philosopher's life.

NOVELS.

OF the novels of the month, DISRAELI'S *Lothair* (D. Appleton and Co.) must be conceded to be the most remarkable. It is remarkable that the ex-Prime Minister of England should seek relief from the cares of public office in the recreation of romance writing. It is remarkable that a Jew should write the most characteristically and the most broadly catholic religious novel of the season—a novel which reiterates again and again the declaration that “religion should be the rule of life, not a casual incident in it.” It is remarkable that a man approaching the limit of threescore and ten should write, not exactly a love story, but a story full of the passion of love, not only with an imagination which borders on the extravagance of Orientalism, but with a fervor of utterance which belongs only to the enthusiasm of youth. It is remarkable in an age when literature is consecrated to democracy that one born a democrat should write a novel which constitutes in reality, though not in form, the most elaborate eulogy of aristocratic institu-

tions; and still more remarkable that he should succeed in making it entertaining and unconventional. It is remarkable that a man who is a politician by nature, as well as by long education, should take up the novel as a weapon when defeated at the polls; but still more remarkable that he should have the self-control to write for a partisan purpose without defeating his object by the display of partisan bitterness. It is finally remarkable that it should be reserved to a man who was never accused of being hampered by any principles, or perplexed by any conscience, to write what is the most powerful of modern anti-Catholic novels; and still more remarkable that in doing so he should have produced a romance which rarely verges on the melodramatic, which concedes honesty to the Church against which he levels his polished shafts, which honestly and ably interprets it, and which is the more powerful because, with one exception, it never exceeds the bounds of probability. It is this which will perhaps give to “*Lothair*” its chief value in England. In America its chief value lies in its portraiture of English society. From the opening chapter to the close we live in an atmosphere of aristocracy. The only American introduced is an American aristocrat. And though in the descriptions every noun has its adjective, and every adjective is a superlative—though the English summer has a “lustrous effulgence”—though every country seat is an “Italian palace” “vast and ornate;” or a “vast edifice,” the walls of which are “breathing with English history” in the form of antique portraits; or “a stately mansion” “shadowed with the dark forms of many huge cedars, and blazing with flower-beds of every hue;” or “a mansion” the approach to which is through “a vast park,” which “spreads in all directions beyond the limit of the eye,” and the entrance to which is through “mighty gates of wondrous workmanship”—though, in short, a too luxuriant imagination clothes English scenery and English scenes with an Oriental magnificence, nevertheless, making some allowance for the exaggerations of the novelist, it must be generally conceded that Disraeli has painted a picture of English high life scarcely less fascinating, despite its unreality, than the truer portraiture which Dickens and Thackeray have given us of its middle classes.

Beneath the Wheels (Harper and Brothers) depends for its interest rather upon the ingenious construction of its plot and the vigor of its action than upon any development of character or play of sentiment. In general style and structure it resembles Wilkie Collins's novels, and is not inferior to them in the success with which it maintains the interest of the reader from the commencement to the close.

BRIEF MENTION.

REV. F. W. ROBERTSON spoke to the culture and refinement, to the brain of England, as Spurgeon speaks to its muscle. It is hardly necessary now to enter into a critical discussion of one who has been more criticised and discussed than perhaps any living clergyman. We are glad, however, to welcome a cheap edition of his *Sermons*, in a single volume, from the press of Harper and Brothers, in a form which will enable not only every student, but every family

to possess them. There are some men who think for us, and whose intellectual harvests we garner. There are others who compel us to do our own thinking. Mr. Robertson is one of the latter class. He is the most tender, the most subtle, the most suggestive, and the most heroic of preachers—the poet of the pulpit, as Beecher is its orator, and Spurgeon its dogmatist.

DE PRESSENSÉ gives us in a book form twelve letters from Rome, under the title of *Rome and Italy at the opening of the Ecumenical Council* (Carlton and Lanahan.) The book gives really very little information, however, about the Council; less than any well-informed reader of the American press possesses already. The seventh and eighth chapters alone contain any thing material that is new; the rest of the book is composed in about equal parts of history and travel—history of the Rome of the past, and observations on the Rome of the present.—We have tested *INGLIS'S Bible-Text Cyclopædia* (Lippincott) in the only way in which such a work can be adequately tested, by several months' use. It professes to be a "complete classification of Scripture texts in the form of an alphabetical index of subjects." Whether complete or no it is exceedingly convenient, much more satisfactory than the "Scripture Manual," Gaston's "Collection," or West's ponderous and ill-digested "Analysis." It is certainly not so complete as Professor Hitchcock's large work; but it is more easily handled, and the alphabetical arrangement is better for ordinary purposes than the scientific classification.—*CLARK'S Harmony of the Four Gospels* (S. W. Green, New York) does not differ very widely from Robinson's earlier well-known work, except in the "last days." The author has had the advantage of the labors of later scholars, and has made good use of them. In the uncertainty in which the disputed points of chronology are and ever must be involved, he may be accepted as a safe and judicious guide.—Professor COWLES adds to his previous commentaries a volume on *Proverbs, Ecclesiastes, and the Song of Solomon*. (D. Appleton and Co.) These commentaries are not distinguished by subtle thought or erudite scholarship, nor does the author dwell in detail on niceties of verbal exegesis; but they are characterized by strong common-sense and an illumination of the general aim of the inspired writers. It is a book for laymen, Bible-class teachers, and Sabbath-school scholars, rather than for clergymen and professional students.

Among the literary institutions of New York city, little known outside of the small and select circle which sustains it, is the American Geographical and Statistical Society. It has now been in existence sixteen years—it was incorporated in 1854—though it was substantially suspended during the war. In those years it has accumulated a library of ten thousand volumes, in its unpretending rooms in the Cooper Institute, where the curious will find what is, doubtless, by far the best collection of works on geographical subjects in this country, including an invaluable connected series of Atlases, from that of Ortelin's, in 1573, to those of the present day. The second part of the second volume of the *Journal* of this Society is before us. Passing by its charter, by-laws, and reports of its meetings, which are matters of no special interest,

we find in the bulk of the volume a series of papers which are as interesting, at least to the student, as they are valuable, as contributions to the cause of science. Such papers as Dr. Hayes's "On Arctic Explorations," Captain Bent's "On the Routes to be pursued by Expeditions to the North Pole," and Paul du Chailu's "On the Pigmies of Equatorial Africa," may suffice as samples of contributions to a discussion into which we dare not enter, even as critics, lest we pass those reasonable bounds which we are compelled to set to our own pen. The most valuable paper is the "Annual Address" of the President of the Society, Judge Daly, who sums up with judicial brevity the great geographical events of the year. But, gentlemen, why do you call yourselves a "statistical" society? We look in the pages of your journal in vain for a solitary statistic.

Among the books of poetry, to which we are compelled to give but a word, but to which we should like to give many, we put foremost SAMUEL W. DUFFIELD'S poems, *Warp and Woof* (Randolph), a book which has some charming poetry in it, all of a sweet and soothing sort, with a certain plaintive undertone; and with a certain devout element inhering in the pattern of even those woven from the least sacred threads.—The *Bab Ballads*, by W. S. GILBERT (Porter and Coates), is rightly described in its title-page as "much sound and little sense." Its humor has the flavor of the ballads of the London *Punch*, in whose pages, if we mistake not, some of them were first published. One must be very tired and stupid indeed to enjoy such pure specimens of unmitigated nonsense.—Of the *Poetical Works of David Bates* (Claxton, Remsen, and Haffelfinger) we could say nothing better in the way of description than that the same kindly spirit breathes through all of them which has given to the author's "Speak Gently" a place in all modern collections of hymns. His poetry is that of the social affections. When, in such subjects as an "Apostrophe to the Ocean," or "The End of the World," he attempts the sublime, he falls into—a step below it.—Dr. WHITE'S *Miscellaneous Poems* are said, in the dedication, to be published at the request of his friends. They are pleasant, chirruping, bird-like songs, that will not be likely to attract many listeners beyond the circle which called for their publication.—The *New-Fashioned Girl* (James Miller) is a most unsuccessful attempt to imitate "Nothing to Wear."—From the house of Carter and Brothers, who rarely publish a poor juvenile, and never an objectionable one, we receive four very good ones: *Lily's Lesson* and *Violet's Idol*, the first two of a series of stories on the commandments, by the author of the "Bessie Books," capital children's stories, both of them; *Busy Bees*, or *Winter Evenings in Margaret Russel's School*, equally good for older children; and *Our Father in Heaven*, a series of simple discourses on the Lord's Prayer, which lack, however, the necessary illustration to secure and retain the attention and interest of juvenile readers.—Charles Scribner adds to his "Illustrated Library of Wonders" the *Human Body*, from the French of A. LE PILEUR. It is really only a treatise on physiology, and is not superior, in illustration is not equal, to some American treatises on the same subject—Dalton's, for example.—

Miss YOUMANS'S *First Book of Botany* (D. Appleton and Co.) is capital. If you live in the country, or within reach of trees, leaves, and flowers, get it, and spend fifteen minutes every day with your children, with this guide-book to nature in your hand. It will do you good as well as them. Very young children can be interested in the study of nature by the plan she develops.—Mrs. GLEASON, in her *Talks to My Patients* (Wood and Holbrook), is able to say something to wives and mothers which no man could say. There will be some difference of opinion about the water-cure treatment which she prescribes, but there can be none about the value of the practical suggestions she affords, which are characterized by sound philosophy and clear, good, sterling common-sense. We wish the chapter, "Confidential to Mothers," might be published as a tract and sent to every mother in the land.—*Out of the Past* (G. P. Putnam and Son) might as well have staid in the past. Not but that these "critical and literary

papers" of PARKE GODWIN are very good, but they are not so remarkably superior to the average contributions to the magazines as to demand a special place in permanent literature.—Friedrich Gerhard, New York, has published the first volume of the *Deutsch Amerikanischer Conversations Lexicon*, prepared, under the able superintendence of Professor ALEX. J. SCHEM, on the basis of the German "Conversations Lexicon," with special reference to the wants of the German population of this country. The articles on American subjects are full and exhaustive, and present a great amount of information that must be most valuable to the German immigrant.—We are obliged to postpone, till another month, several books of importance; prominent among which we may mention Dr. SPEER'S work on *China*, COCKER'S *Christianity and Greek Philosophy*, MULFORD'S *Nation*, and Dr. M'COSE'S *Logic*, as well as SPIELHAGEN'S novels, of which a new volume, *Hammer and Anvil*, is just issued.

Editor's Scientific Record.

PREPARATION OF FRUIT SIRUPS AND PRESERVES.

MOST of our readers are aware that there are two different classes of sugars: the cane sugars, derived from the cane, the beet, etc.; and the grape sugars, as found in the grape, in honey, and as prepared artificially from potatoes—the latter used principally in the fabrication of wines. Both forms of sugar have much the same taste, and can not be distinguished readily in solution. Of the cane sugars, however, only half the quantity is required to produce a given sweetening effect as of the other. It may not be known generally, however, that cane sugar, by long boiling, becomes changed into grape sugar, and thus loses a portion of its sweetening power. This takes place not only in the process of clarifying, but also in preparing fruit sirups and preserves. Should the sirups be thickened beyond a certain degree, the grape sugar produced, being only about one-quarter as soluble as cane sugar, separates after a time in the form of white crystals, the comparative want of sweetness in which will be very evident to the taste. Mixed with water as a drink, twice as much will be required as if no change had occurred. This furnishes a useful hint to housekeepers, which has been acted on to great advantage—namely, to boil the fruit juice by itself for the proper time and allow it to become lukewarm, adding the proper quantity of white sugar, which soon dissolves without further heating. The juice is preserved in this way as perfectly as if the sugars were boiled a long time with it, maintains its original sweetness without the formation of crystals, and a much less quantity will answer the purpose. The same theory is applicable in the preparation of preserves as of sirups.

CONFUSION OF NAMES IN NATURAL HISTORY.

Rich as we are in various possessions, we are in nothing more opulent than in names for various familiar animals, such as fishes, birds, etc. It

is with this as with material wealth—we would often be better off if our lot were cast in comparative poverty. Take, for instance, our edible fishes. There is scarcely one kind that has the same name at any two prominent points on our coast, while each particular appellation is made to do double and triple duty, so that when a name is mentioned the residence of the speaker or writer must be ascertained before the precise species of fish referred to can be understood. Instance a few examples. The rock-fish of the Chesapeake waters is the striped bass of more eastern localities, the rock-fish of New England being totally different. The sea bass of one place is the black bass of another, and the blackfish of still another—the last-mentioned name being elsewhere used for a kind of porpoise. The sunfish of the interior fresh waters, a kind of perch, is very different from the sunfish of the coast, which may be either a huge, broad fish, looking as if the posterior half had been cut away, or else a mass of floating, animated jelly. The bluefish of Atlantic City is called weak-fish in New York, shecutts on Long Island, squeteague in New England, sea-trout or trout in Philadelphia and Baltimore. The bluefish of New York is the tailor of Philadelphia, the horse-mackerel of New Jersey, the white-fish of Lower Hudson, the skip-jack elsewhere. The king-fish of New York is the hake of New Jersey, the whiting further south; while hake in New England means a kind of cod. The tautog of Massachusetts is elsewhere called blackfish and chub—the latter name again having a different meaning in the interior. The same fish is called pike-perch, pickerel, and pike in the West, and salmon in the Susquehanna River, without being in the least like the species properly so named. The fishermen in Florida and Alabama will give glowing accounts of the capture of "trout" in the fresh waters of those States; but they are not the trout of the Southern coast, nor yet the trout of our Pennsylvania mountain streams, but of the same character as the black bass of

the West. The shad of Lake Champlain is not the shad of the coast, but the white-fish of the great lakes. The herring of those lakes are not true herring, but, like white-fish, a member of the salmon family. The subject might be pursued indefinitely; but we have said enough to show that every name is applied to several different species, and every species has many names.

As with fishes, so with birds. The partridge of Pennsylvania is the quail of New England and New York, and by no means the partridge of the latter region, which is what we call the pheasant, an entire misnomer, it being very different from the true pheasant of the Old World.

It is facts like these that vindicate the propriety of the scientific names applied to these and other objects of natural history by the man of science. It is, of course, well in popular discourses to avoid a pedantic reiteration of learned terms; but without the language of science to fall back upon as a foundation, intelligible to all naturalists, it would be totally impossible to understand what is meant, in many cases. The condition of things becomes still more complicated when different countries are taken into account. Popular works of natural history, written by the French, and even learned treatises, are usually quite unintelligible, from their use of vernacular names, and neglect to connect with them, in some way, those derived from the Latin and Greek languages, and in current use by scientific men.

EFFECT OF THE FOOD OF COWS ON THEIR MILK.

It has lately been announced, as the result of careful and long-continued investigation, that the nature of the food given to cows does not produce the slightest effect upon the character or richness of their milk; the only difference being a greater or less percentage of water. The experiment was tried of feeding the same animals successively with hay alone; then, successively, with hay mixed with starch, oil, rape-seed, clover, etc., thus giving a greatly varying proportion of nitrogenized food. The milk was very carefully analyzed, after each change of food, without showing the slightest variation in its chemical constitution. The conclusion was, therefore, arrived at that the variation or improvement in the quality of the milk is to be accomplished rather by a careful regard to the breed than to the food supplied to the animal.

These remarks, of course, do not apply to the peculiar taste imparted to milk in consequence of the character of the food of the animal; since it is well known that the milk of cows which have fed upon garlic very soon furnishes evidence of that fact to the taste.

FERTILE CROSS BETWEEN AMERICAN ELK AND EUROPEAN RED DEER.

It is said that a German nobleman has succeeded in obtaining fertile hybrids between the American elk and the red deer of Europe, on his estate in Silesia. The experiment was commenced in 1862, and has been continued to the present time, the breed being very prolific, and a new race intermediate between the two having been developed, which seems to have all the characteristics of permanency. The half-breed is of a very large size, resembling most its Ameri-

can ancestor, being decidedly larger than the European stock.

STONE IMAGES ON EASTER ISLAND.

Much attention has been excited lately by the discovery on Easter Island—a small speck in the midst of the Pacific Ocean, about forty degrees west of Chili, not thirty miles in circumference, without trees, without metals, and supporting only a scanty population of half-starved savages—of an immense number of gigantic representations in stone of the human head, from twenty to fifty feet in height, and supported, in many cases, on long platforms of masonry. There are no means of ascertaining when or by whom these curious figures were constructed, the present inhabitants of the island having no traditions in regard to them, and venturing no suggestions. What tools were used in their production can not be learned, as no implements of any kind seem to have been discovered in association with these huge remains. They are said to resemble very closely the figures found in Mexico and Central America, and to be of about the same character of workmanship.

A curious appendage to many of these statues consists of a crown of volcanic tufa placed on the top of the figure. These, in some cases, are six feet high and five feet in diameter, and must have been placed on the top after their erection; by no means an easy task, as is suggested by the writer of the account from which we derive these facts.

RELATIONSHIPS OF THE AURORA.

A recent article by Mr. Proctor, upon the aurora, may be summed up as follows: First, the increase and diminution of the disturbance of the magnetic needle corresponds, in periods of about ten years, with the increase and diminution of the number of solar spots; secondly, the auroral displays announced as seen from all parts of the earth probably correspond to similar manifestations upon every planet; third, the spectrum of the aurora exhibits only a single bright line, and hence it is due to luminous vibrations, the luminosity being caused by the passage through it of electrical discharges; fourth, the same bright line is exhibited by the spectrum of the zodiacal light, by the sun's corona as seen during a total eclipse, and very faintly by the peculiar phosphorescent light sometimes seen over the whole sky. Finally, he concludes that the key to these phenomena probably lies in the existence of myriads of meteoric bodies, traveling separately or in systems around the sun.

PREPARATION OF LAMB AND RABBIT SKINS.

Among the mechanical employments especially suited to women, that of dressing small skins, such as those of lambs and rabbits, for ornamental purposes, has lately been suggested, there being a great demand for such articles, and one that can be readily extended. The best method of preparing these consists in taking about four skins at a time, and first washing them in cold strong soap-suds made with hot water, allowed to cool before use. The dirt is to be thoroughly removed from the wool or hair, and the skin is again washed in clean cold water until all the soap is removed. Half a pound each of salt and alum are then to be dissolved in a little hot

water, and put in a tub with cold water sufficient to cover the skins, which are allowed to soak therein twelve hours, and afterward hung over a pole to drain. When well drained they are stretched very carefully on a board to dry, and while drying they are to be restretched several times. Before they are entirely dry, the flesh side is sprinkled with a mixture of one part each of finely powdered alum and salt; and this is to be well rubbed in. The flesh sides are then to be laid together, and the skins hung in the shade two or three days, turning them over every day until perfectly dry. The flesh side is finally to be scraped with a blunt knife to remove any remaining scraps of flesh. The skins are then rubbed up to soften them, and finished finally with pumice-stone.

VARYING DENSITY OF THE EARTH'S CRUST.

It was some time ago suggested by Mr. Airy, the eminent British astronomer, and others, that the density of the earth's crust under lofty mountains, such as the Himalayas, is probably less than that under plains, at a distance from the mountains; and that below the sea bed, the crust of the earth is as much denser through a certain depth as would equal the deficiency of matter caused by the ocean hollow, while below the mountains it is as much less through a certain depth as will account for the excess of the mass in the mountains. This hypothesis, of course, requires careful observations for its verification; and we are now informed that a series of pendulum and other apparatus, that has just done good service in the great triangulation survey of India, will probably be taken to the highest accessible land of the Himalayas, for the purpose of further experiment. It will, of course, be impossible to make the observations at the bottom of the sea; but, as the nearest approach to this condition, experiments will be instituted upon certain low islands in the ocean at some distance off the coast of India.

CURE FOR OBESITY.

Mr. Schindler is the latest addition to the list of persons who have undertaken the treatment and cure of excessive fatness in the human race—this condition being considered by him as a disturbance of the animal economy, in consequence of which the carbon taken in is accumulated in the form of fat. Diet and exercise, as might be expected, constitute the basis of his treatment. As in the method of Mr. Banting, which some years ago was so much in vogue, the diet advised for fat persons consists of food containing a large percentage of nitrogen, to which some vegetables without starch, and cooked fruit, are to be added, for the purpose of moderating the excitation due to animal nourishment. This diet is to be varied, according as individuals are of a sanguine or lymphatic temperament. The use of certain wines is permitted; beer is, however, entirely forbidden. Coffee and tea are allowed, with as little sugar as possible. Cheese, potatoes, rice, beans, pease, maize, maccaroni, tapioca, arrow-root, and soups are not allowed. The use of sulphate of soda is recommended, as moderating the transformation of nitrogenous materials and stimulating the oxidation of fat; and the use of mineral waters containing the sulphate of soda in solution is considered of the greatest import-

ance in this respect. The waters of Marienbad, which are especially rich in this salt, are stated to have, usually, the most happy effect. Their use, together with that of some alkaline pills, and a strict adherence to the conditions above mentioned, caused a decrease in weight of from twenty-five to sixty pounds in different individuals in the course of a few weeks.

DOMESTICATION OF THE HORSE AND THE ASS.

We have already referred to the investigation by Mr. Lenormant in regard to the possession of the horse and ass by the people of ancient days. In a more recent communication he sums up his latest conclusions by stating that the two animals were originally natives of totally different countries, the horse having been domesticated on the plateaux of Central Asia, and the Aryan migration having been the principal cause of its diffusion throughout the world. Its adoption by the Semitic races was much later, and it did not make its appearance in Egypt until about twenty-five hundred years before the Christian era. The ass, on the contrary, was an African species, domesticated originally on the banks of the Nile. From Egypt it passed, at an early period, among the Semitic people, who subsequently handed it over to the Aryan tribes—on the one side into Greece, on the other into Persia; and in its diffusion, which ultimately became universal, it took a direction precisely opposite to that of the horse. The two animals, however, starting from such remote points, finally came face to face, and were brought into general use by all nations.

LIFE BUOY.

Some French journals are quite ecstatic in their commendation of a new safety buoy, which has the advantage when thrown overboard in a dark night of becoming ignited, so as to furnish the means of illuminating the surface of the water for a considerable distance around, thereby enabling steps to be taken for the rescue of any persons who may be struggling in the water. The buoy is coated with phosphuret of calcium, which is ignited by the water and burns with a lambent flame, but having very little heat, so that any one in the water may lay hold of the buoy and be sustained until rescued. It is said that buoys of this construction are to be placed on board all the vessels of the French navy, and they are recommended for use by the mercantile marine generally. The stifling odor of the phosphuret must, however, be a serious obstacle to its employment for the purpose in question.

DRAINING WET SPOTS.

A simple method of draining certain wet and swampy tracts, especially those of low basins, consists in sinking an Artesian shaft through the soil to the layer of clay or other substance preventing the proper drainage, and into the sandy strata underneath. The cavity of the well may be filled up with broken stones, among which the drained water percolates and passes off below, leaving the surface entirely dry.

REMOVAL OF GREASE FROM MARBLE.

Housekeepers are often worried by the existence of grease spots upon marble slabs, and may, perhaps, feel obliged to us for the indication of

a method which is said to be effectual in removing them. For this purpose eight ounces of concentrated caustic soda are mixed with an equal quantity of ox gall, and four ounces of turpentine carefully stirred in; and to the whole enough pipe-clay is to be added to form a thin paste, which is to be run through a hair sieve. It is then to be spread in a coat over the spots upon the marble, and removed after twenty-four hours. This application is to be repeated until the marble has become perfectly clear, and free from stain.

Another method consists in mixing a concentrated solution of soap with slaked lime, to a creamy consistency, and applying it as above.

THE ANCIENT MAMMALIAN FAUNA OF EUROPE AND ASIA.

Professor Brandt of St. Petersburg, in the course of an elaborate discussion of the development of the mammalian fauna of Northern Asia and Europe, comes to the conclusion that Northern Asia, in the tertiary period, was inhabited by its present fauna, which, however, then included several species now extinct; and that the quaternary fauna of Europe was the result of an immigration from Northern Asia. He finds no evidence that man existed in the tertiary period, but thinks that such evidence may hereafter be presented. The changes of the original quaternary fauna, he thinks, were effected not only by terrestrial and climatic agencies, but also to a considerable extent by the intervention of man; and in this fauna he establishes five phases:

In the first phase this fauna flourished in Northern Asia, and included among other species the mammoth, hairy rhinoceros, aurochs, bison, musk-ox, reindeer, musk-deer, and other species, together, probably, with the tiger and hyena. Man may have existed during this phase; but the fact has not yet been positively ascertained.

The second phase extends from the spreading of this fauna into Middle, Southern, and Eastern Europe, to the time of the extinction of the mammoth. The coexistence of man with the mammoth in this period is beyond doubt; and although the people who assisted in its extermination belonged to the pre-historic period, and had advanced little in the arts of civilized life, it is yet possible that man may have lived contemporaneously, in a higher state of culture, in other parts of the globe (as in Egypt, Assyria, and possibly China).

The third phase terminates with the extinction of the reindeer in the southern half and centre of Europe, although this animal continued to exist in Scotland down to the twelfth century. This period extends to the Christian era.

The fourth phase reaches from the disappearance of the reindeer in Western Europe, to the extinction of the aurochs, in the fifteenth century.

The fifth phase is that of the present fauna.

Dr. Brandt is well known as one of the most eminent naturalists of modern times, and his researches into subjects of this kind have always commanded the greatest respect. One suggestion, among others, recently made by him is, that the *Dinotherium*, a well-known fossil mammal, really belongs to the series of terrestrial elephantine animals, resembling the mastodon in form, and differing principally in being of even greater

size, and in possessing two tusks in the lower jaw and none in the upper.

SPECIMENS EXTANT OF THE GREAT AUK.

It is doubtless known to many of our readers that this large sea-bird, once so abundant on the coast of the North Atlantic, is now entirely extinct, none having been seen living for nearly forty years. Professor Newton, of Cambridge, England, who has made this bird a special study, informs us in a late article that he is personally cognizant of the existence in the public and private museums of Europe of sixty-five skins, five skeletons nearly complete (besides detached bones of at least twenty individuals), and sixty-one eggs, and has heard of a few other specimens. In the United States the museums of Vassar College, the Academy of Natural Sciences in Philadelphia, and the Smithsonian Institution, possess a mounted specimen each, and the two last-mentioned establishments have an egg apiece. In the Museum of Comparative Zoology in Cambridge is to be found the only complete skeleton in the country, although detached bones gathered from the ancient shell heaps of New England are to be met with in several collections.

FISHERIES OF THE NORTH ATLANTIC.

Our readers will doubtless be interested in certain facts relative to the habits of one of the principal fish of the North Atlantic, recently published by a Mr. Howden in a London journal, and in the connection there indicated, for apparently the first time, between the fisheries of Norway and those of Newfoundland. The great centre of the codfishery in Europe is in the vicinity of the Lofoden Islands, a group situated off the northern extremity of Norway, within the Arctic Circle. Here the codfish gather early in January, coming from the southwest, to deposit their spawn. In the quiet and shallow waters of the arctic seas they find all the conditions necessary for the hatching of their young; and as all other fish disappear from the grounds on the approach of the cod, there is no destruction of the ova nor of the new-born fry.

It is during the sojourn of the fish on the Lofoden banks that the great fishery takes place. During January but little is done; but with the first week of February, and the arrival of professional fishermen from considerable distances, the work begins in earnest. As many as twenty-five thousand men are thus assembled; and the number of fish being inexhaustible, as well as incalculable, it is the state of the weather alone that affects the result. The fish are caught with lines and nets—the former baited with herring, which have to be brought from a distance, since, as already stated, all other fish disappear with the arrival of the cod. The capelan—a kind of herring—is the best bait; but its use is prohibited by Norwegian law, since those so fortunate as to have it would enjoy an undue advantage over their less favored neighbors. The fishing ceases on the 14th of April, by which time the fish become lean and emaciated and in poor condition, although very fat and strong on their first arrival. The old fish then leave the coast, and it is now suggested by Mr. Howden that they proceed to the banks of Newfoundland, there to fatten and be caught again during the summer months. He calls attention to the fact that codfish disappear

from the Lofoden banks in April or May, and that codfish arrive on the Newfoundland banks in June, hungry and lean, in fierce pursuit of the capelan, herring, and other marine animals so abundant there. There they soon fatten up, and disappear again in October. Should the fish of the two regions be the same swarms, as they are of the same species, they will move backward and forward at intervals of about six months in the Gulf Stream, which connects the two localities. Iceland lies about midway, and the appearance of the cod at this island is intermediate in time between that at the Lofodens and Newfoundland. Hence the inference that the same schools of fish, after fattening during the summer on the Newfoundland banks, proceed during autumn to Lofoden to spawn, returning when this is accomplished. If the cod of the North Atlantic, therefore, have so migratory a habit, it is possible that those of the North Pacific may share it; and as the new fisheries about the Shoumagin Islands of Alaska are in the summer season, there yet remains to be discovered the locality still farther north, probably north of Behring Straits, where they deposit their eggs, and where the true analogue of the Norwegian fisheries is to be developed. The total annual catch of codfish in the North Atlantic on both shores is estimated by Mr. Howden at fifty-four millions. This seems a prodigious number, and one that would soon threaten exhaustion of the species; but when we remember that nine millions of eggs have been found in the roe of one female, there seems less danger of extinction than at first might be supposed.

ALBOLITE CEMENT.

Albolite cement, a substance which has recently excited a considerable degree of attention, is made, according to the inventor, Mr. Riemann, by mixing calcined and finely pulverized magnesite (native carbonate of magnesia) with infusorial earth, and stirring in a solution of chloride of magnesium. Among the properties of the cement, as enumerated by the inventor, are a high degree of plasticity, and of hardness after it has become fixed, and a spontaneous development of heat as soon as it is solidified to the consistency of wax, this increasing in proportion to the size of the mass into which it has been moulded. It is extremely hard, a peculiarity increased by its elasticity, and adheres very well to stone, wood, and dry oiled surfaces, but can not be used under water. It is now largely employed in the preparation of ornamental mouldings, for which, however, in consequence of the above-mentioned development of heat, gelatine moulds must be cautiously used. By coating ornaments of gypsum with this cement it imparts to them a great degree of hardness. It is also used for repairing worn-down sandstone steps, for facing stone and wooden steps, for fire-proof coating to boards in the interior of houses, and also for preserving railroad ties, etc.

In this connection it may be remarked that magnesite occurs as a native mineral, in great abundance, near Texas, Lancaster County, Pennsylvania.

CHARACTER OF NORTHERN SEA BOTTOM.

Among the most interesting results of the later surveying expeditions toward the North Pole are

those furnished by the Swedish party of 1868, which devoted itself especially to a survey of the sea bottom in high latitudes. Spitzbergen was found to be connected with Europe by a kind of submarine bridge, of which the average depth was less than 200 fathoms, the maximum reaching only 271. On the western and northern coast, however, separating it from Greenland, a very remarkable and abrupt depression of the bottom was ascertained to exist, so that, at a distance of only sixty miles from the Seven Islands toward the north, a depth of 1370 fathoms was met with; while one hundred and fifty miles from the coast, to the west, the sounding-line revealed the existence of a gulf 2650 fathoms deep, or 15,900 feet. Contrary to the assumptions of many naturalists, and the general impression of most persons, these depths were found to abound in animal life of the most varied character; so much so as to have occupied the labors of eminent investigators for many months in their examination. The detailed results are not yet published, but are looked forward to with much interest.

The discovery of this remarkable gulf between Spitzbergen and Greenland shows a state of facts entirely contrary to the view formerly held in regard to the sea bottom at that point; as it was supposed that this became gradually shallower toward the pole, and formed a nearly uniform level, which, with a moderate degree of upheaval, would be brought out of water. For the bridge which has been supposed, during previous geological periods, to connect Greenland with Europe, we must look much further to the south; since, with so deep a gulf as that indicated, an enormous elevation of the sea bottom would be required to establish any connection of dry land between the two countries, unless, indeed, a great subsidence has taken place along the line in question.

METHOD OF DESTROYING APHIDES.

In answer to the inquiry so frequently made for some means of destroying aphides, and other insects on plants, without injury to the latter, the following method is recommended by the *Revue Horticole*, with an indorsement of its answering perfectly the desired object: The preparation is made by adding to seven pints of water three and a quarter ounces of quassia chips, and five drachms of the seed of the garden larkspur. These are to be boiled together until reduced to five pints. When the liquid is cooled it is to be strained, and used with a watering-pot or syringe, as may be most convenient. The use of larkspur seed for the destruction of the insects infesting the human head is a time-honored application among country people—beds of the plant being cultivated frequently for the express purpose of furnishing material for the decoction. The efficiency of this remedy seems to depend on the presence of the alkaloid called delphine, which appears to be a poison especially fatal to insects.

MONOSULPHITE OF LIME IN MAKING SUGAR.

It is stated that the monosulphite of lime is now largely employed in the manufacture of sugar. For this purpose, the salt, which is nearly insoluble in water, is added to the crude juice of the cane. The nitrogenous matters become insoluble, and can be removed in the scum. It is

suggested that the same reagent may be found useful for the purification of other organic compounds.

ACTION OF MALTINE.

In a recent communication to the Academy of Sciences of Paris M. Coutaret calls attention to some valuable applications of maltine, or vegetable diastase—a substance obtained by the continued maceration of germinating barley at a lukewarm heat. When this is added to ordinary cooked food, containing starchy matter, it gives rise, in the course of an hour, to a milky liquid, composed of unchanged starch, dextrine, and glucose. Water is an indispensable requisite of this artificial digestion, not less than ten times the amount of that of the substance treated being needed. The solvent action of the maltine upon starchy substances varies according to their species—five grains of maltine causing the digestion of from one to four pounds of the cooked starch. A temperature of 95° to 105° Fahrenheit proves to be the best suited for this artificial digestion. The author goes on to show that this saccharifying influence of maltine upon starch is precisely that of the salivary juice, or the animal diastase, upon the same substance; indeed, he maintains that these two forms of diastase are entirely similar in their chemical, physical, and physiological properties, both having the same solvent effect upon cooked starchy matters. Our author infers, from his observations, that maltine is a very important substance in the treatment of dyspeptics, since starchy substances constitute the basis of human food. In the greater number of cases of dyspepsia, he maintains that it is the lack of the digestion of the starchy substances that causes the trouble, as is shown especially where there is alteration, diminution, or absence of saliva. For these cases maltine is of special benefit, as it may be used to supply any deficiency in the natural secretion. For several years the author has found that maltine renders the most important service in instances like those mentioned. He maintains that, next to a proper diet and the use of alkaline waters, there is no medicine so harmless, and, at the same time, with such a curative tendency, under the same conditions.

THE PASCAL-NEWTON FORGERIES.

Some of our readers may remember the controversies which arose some months ago in Europe in reference to certain "autograph" letters of Pascal, Galileo, Newton, and other great physicists, which were claimed to be genuine by M. Chasles, an eminent French Academician, but denounced by others. The gist of the letters went to prove that Newton had derived all his ideas of universal gravitation and other discoveries or announcements from Pascal's letters to him. Although the impossibility of this was pointed out over and over again, nothing shook the faith of the great savant. Finally, however, after he had paid a sum of \$25,000 for the letters, thus giving convincing proof of his own good faith, he was obliged to confess that he had been cheated, and that all the pretended "original letters" were forgeries. The perpetrator proved to be an ingenious lawyer's clerk, Vrain Lucas, who seemed to have a fatal facility for this class of literary labor. The offender was arrested during the past summer; and we see, by a recent report of his trial, that he

has been condemned to two years' imprisonment and a fine of \$100.

WHITENING SMOKED WALLS.

A method of cleaning and whitening smoked walls consists, in the first place, of rubbing off all the black, loose dirt upon them, by means of a broom, and then washing them down with a strong soda lye, which is to be afterward removed by means of water to which a little hydrochloric acid has been added. When the walls are dry a thin coating of lime, with the addition of a solution of alum, is to be applied. After this has become perfectly dry the walls are to be calcimined, or coated with a solution of glue and chalk.

RENDERING ARTICLES WATER-PROOF.

A patent has recently been taken out in Paris for a method of rendering paper, cloth, cork, sponge, and other porous substances, water-proof, as well as articles manufactured from these materials, including bank-notes, envelopes, gloves, clothing, paper collars, umbrellas, labels, etc. The process consists in dissolving paraffine, cut up in small slices, in pure naphtha or benzine, entirely free from fat or oil. The solution is to be made in a vessel with a glass stopper, and is to be shaken repeatedly until the result is accomplished. An excess of paraffine should be used, so as to make sure of having a perfectly saturated solution. The articles to be treated are immersed in this for a time, according to the thickness or porosity of the tissue, and arranged to secure either a complete saturation or the penetration of the liquid to any required depth. After removal the articles are to be dried by the application of heat or in the air. The solvent evaporates, leaving the paper or other substances saturated with paraffine impermeable to water, and capable of resisting the action of acids. Articles of dress, such as paper collars and wristbands, should be subjected to the action of a flat-iron or heated cylinder, in order to give them a high degree of polish. The applications of this process are manifold, and new ones are constantly suggesting themselves.

COAST SURVEY DREDGING OFF THE FLORIDA COAST.

The scientific world has been much interested of late years by the observations of Count Pourtales, of the United States Coast Survey, upon the marine fauna of the seas between Florida and Cuba, the facts observed by him having received additional importance in consequence of the discoveries of the British and other expeditions in the North Atlantic. Several reports upon the collection of Count Pourtales have been published by the Museum of Comparative Zoology; and among the most recent of these we find a statement by Professor Agassiz of the general results attained by the Coast Survey expeditions.

The Professor, in the first place, shows the existence of a littoral fauna around the Floridian and West Indian reefs, not extending in depth below ten fathoms, and occupied principally by coral, which aggregates in large masses, and from which are usually derived the showy specimens of most of our museums. Beyond this area, the width of which along the coast of Florida varies from a few miles, near Florida, to twelve, fifteen, or twenty off Cape Sable, is another region or

zone, the bottom of which consists of a muddy mass of dead and broken shells, broken corals, etc., the mud being chiefly inhabited by worms, and by but few other living animals. This table runs out to a depth of about forty fathoms, varying in width in different places, and is bordered externally by a third region or zone, which, beginning at a depth of about fifty or sixty fathoms, extends gradually to about two hundred and fifty, expanding into a broad table-land, beyond which the sea bottom sinks abruptly into deeper waters. The floor of this zone, for which Professor Agassiz proposes the name of the "Pourtales Plateau," is rock, and forms a limestone conglomerate, varying from eight to twenty miles in width, built up entirely of the remains of animals of the same species as those now living upon its surface, and constantly increasing the thickness of the bed by their accumulation, and illustrating in a most interesting manner the way in which mountain masses, or calcareous deposits, have been formed under the bed of the ocean. In this zone an immense variety of animal life was found, including corals of small size and echinoderms, mollusks, bones of the manatee, teeth of sharks, etc. A most interesting fact connected with many of these forms is that their generic relationships are not with living animals, but with those of the tertiary and cretaceous periods; and it is not at all impossible that some of them will be found to be almost undistinguishable, specifically, from certain of those ancient forms. Not only is the variety of animal life very great in this third zone, but the number of specimens is truly amazing, the dredge coming up sometimes almost entirely filled.

To the seaward of this last table-land the bottom sinks rapidly to the depth of from four to eight hundred fathoms or more, and is occupied by a thick adhesive mud, or ooze, abounding in *Foraminifera*, *globigerinae* especially, but much less profuse in animal life than the surface of the coral plateau, and closely resembling the chalk marls of the cretaceous period. This comparative paucity is, however, due, according to Professor Agassiz, to the absence of a rock bottom; and he thinks that if this could be found anywhere the variety would be equally great, and the forms still more remote from those of modern times.

CHANGES IN JUPITER.

In a recent article we referred to the observations of Mr. Browning in regard to the changes of color in Jupiter's belts; and we now have to record a very interesting communication, by Professor Albert M. Mayer, of the Lehigh University, upon the same subject. This gentleman has lately published a record of his observations in the *Journal of the Franklin Institute*, in which he shows that the southern border of the southern equatorial band has divided and modified its shape very materially. He proposes to take careful observations, from time to time, upon the outlines of the belt, and to record them for comparison with the changes noticed in it in other parts of the world, so as to secure, by this means, data for determining many of the phenomena of the planet which are now quite inexplicable. Like Mr. Browning, he remarks upon the great changes which have taken place in the tints of the general surface.

Editor's Historical Record.

THE UNITED STATES.

OUR Record closes on the 31st of May.—The proceedings of Congress embrace a large number of topics; but upon very few of the measures introduced and discussed has final action been taken. An important resolution was brought before the Senate, and adopted by that body, near the close of April (on the 26th), "That the Committee on Education and Labor be instructed to inquire into the expediency of dividing the net proceeds of the sales of the public lands among the several States for educational purposes, and of otherwise so providing by law that all the people of the United States may have the opportunity of acquiring a common-school education." Some time previous a bill had been introduced by Senator Willey for such an appropriation, one section of which provided that in the application of the money no discrimination should be made on account of race, color, or previous condition of servitude: the act to take effect from December 31, 1870. In bringing this bill again before the Senate, April 26, Senator Willey stated that the number of acres of public lands sold last year was 7,666,159. There remain yet unsurveyed 1,326,430,648 acres. "Allowing that only one-fourth of these lands is of a character that would secure their purchase and settlement, it would still present the basis of an

immense sum ultimately to come into the Treasury." The aggregate sales of the public lands for the fiscal year ending June 30, 1869, amounted to the sum of \$4,472,886. The expenses were about \$453,816 43, leaving a net balance of some \$3,919,070. This, divided among the States according to the principles of the bill, would give to each congressional district (if the bill apportioning representation which recently passed the House of Representatives should become a law) the sum of about \$10,600. Estimating the sales to average the same rate in the future, the passage of this bill would secure to each State annually at least the sum of \$10,000 for every congressional district in it. Such a provision alone would seem inadequate to accomplish any great result; but it would greatly aid the States, and doubtless stimulate them to make additional provisions for educational purposes. We have just introduced into our body politic 4,427,067 colored persons, of whom 700,000 have been made voters. This race must be educated. This mass of ignorance must be removed. We are responsible for it. We are also responsible for the imposition of new duties upon the freedmen. Hence our obligation to educate them. Besides, there are in the United States and Territories 1,126,575 white persons over the age of twenty years who can neither read nor write; of these 467,023 are voters.

On May 3 Mr. Jenckes reported back to the House the bill to regulate the civil service of the United States, with a substitute. The substitute provides that all appointments of civil officers in the several departments, except postmasters and such officers as are by law required to be appointed by the President, shall be made from those persons who shall have been found best qualified for the performance of the duties of the offices to which such appointments are to be made, in open and competitive examinations, and after terms of probation, to be conducted and regulated as prescribed in the bill. For this purpose the President is to appoint an officer to be called the Commissioner of the Civil Service, and two assistant commissioners—these officers to hold their positions for five years. Among the duties of this Commission should be the following :

First, to prescribe, subject to the approval of the President of the United States, the qualifications requisite for an appointment into each branch and grade of the civil service of the United States, having regard to the fitness of each candidate in respect to age, health, character, knowledge, and ability for the branch of service into which he seeks to enter; second, to provide, subject to the same approval, for the examinations and periods and conditions of probation of all persons eligible under this act who may present themselves for admission into the civil service; third, to establish, subject to the same approval, rules governing the applications of such persons, the times and places of their examinations, the subjects upon which such examinations shall be had, with other incidents thereof, and the mode of conducting the same, and the manner of keeping and preserving the records thereof, and of perpetuating the evidence of such applications, qualifications, examinations, probations, and their result, as they shall think expedient. Such rules shall be so framed as to keep the branches of the civil service, and the different grades of each branch, as also the records applicable to each branch, distinct and separate. The said Commission shall divide the country into territorial districts for the purpose of holding examinations of applicants resident therein and others, and shall designate some convenient and accessible place in each district where examinations shall be held; fourth, to examine personally, or by persons by them specially designated, the applicants for appointment into the civil service of the United States; fifth, to make report of all rules and regulations established by them, and of a summary of their proceedings, including an abstract of their examinations for the different branches of the service, annually, to Congress at the opening of each session.

The bill also provides for the prescription of a fee not exceeding \$5, to be paid by each applicant for examination; and also a fee not exceeding \$10, to be paid by each person who shall receive a certificate of recommendation from the Commission. An amendment was proposed in the shape of a new section to the bill, making it unlawful for any member of Congress to solicit, recommend, or advise the President of the United States, or any head of a Department, or any bureau thereof, to appoint any person to office or employment; and it shall be unlawful for the President or any head of a Department or bureau to make any appointment so solicited, recommended, or advised on the privity of the applicant; and any person who shall violate this act shall be deemed guilty of a misdemeanor, and on conviction thereof shall be fined not exceeding \$1000; *Provided*, That this act shall not apply to the action of Senators upon nominations submitted by the President to the Senate.

The bill, with its amendments, was recommitted May 5.

In the debate in the House, May 24, on the Consular and Diplomatic Appropriation bill, Mr.

Voorhees, of Indiana, moved to omit Santiago de Cuba from the appropriation, on the ground that "the American flag at that consulate does not protect either the person of the consul himself or the personal safety of American citizens within his jurisdiction. That being the case, Congress should not vote money to keep a representative at that post. He can not reside there in safety." Mr. Voorhees referred to an article in the New York *Tribune* of the 23d in regard to the treatment of Consul Phillips at Santiago de Cuba, and the murder of innocent Americans by the Spanish authorities. The representations of Consul Phillips, according to this article, in regard to the innocence of two American citizens, Speakman and Wyeth, who had been condemned to death, had been utterly disregarded; and on account of a report which he had sent to Washington, reflecting severely upon the Spanish government, he had himself been threatened with assassination, and was obliged to leave the city, being able to escape only under the protection of the British consul.

Mr. Voorhees, in this connection, said, "I enjoin and implore every member of the Committee on Foreign Affairs, and every one of you who has access to the dead man who presides over the State Department, to go to him and tell him, if you can make him hear, that the blood of American citizens cries aloud from the ground for action, cries in mournful and bitter reproaches against him for his imbecility, his sloth, his disregard of the pride and honor and glory and safety of this republic, once great and honored throughout the world, but now sunk so low, through his inaction, that a fifth-rate power slaughters her citizens with impunity, and drives her representatives in fugitive haste from their posts of diplomatic duty."

Mr. Garfield made the following statement in regard to Consul Phillips :

The late consul of the United States at Santiago was General William Steadman, a distinguished citizen of the congressional district which I represent. He died at his post, after having been on duty only a few days. The present consul at that place is also from my congressional district. I have thus had occasion to learn something about the consular duties there; and I desire for a moment to call attention to what appears to me on the surface to be the character of this man Phillips, whose paper has been read at the desk.

When General Steadman died, on the 6th of July, 1869, he was residing in the family of Mr. Phillips, who sent a very brief letter to the State Department, stating the fact of General Steadman's death, and saying that he would in a few days send on his effects, together with a fuller account of the circumstances of his illness and death. More than a dozen letters have been addressed to him since that time by the bereaved family and by the friends of the deceased, yet not one syllable of answer has been received. No effects have been sent on, though General Steadman had in his possession at the time of his death a considerable sum of money. Not a word on this subject has been heard from Mr. Phillips to indicate his purpose or desire to discharge the sacred trust committed to him, or to give any account of the death of the American officer who died in his house. The present consul was at Santiago some weeks before Mr. Phillips left, but has not obtained any intelligence for the family of General Steadman. Very recently Phillips fled from Cuba, claiming that his life was in danger. He went away on a man-of-war, and by some curious process he got himself appointed consul at Jamaica, in place of an American consul who had died there. He obtained his appointment from an American admiral, who had no power to make such an appointment, and the appointment was disavowed and revoked by the Secretary of State as soon as information on the subject was received. It appears also that Phillips was taken

back to Santiago on an American man-of-war, where he might stand on his rights as an American citizen, and that when he arrived there he did not dare to land, as the admiral thought, because of the debts due by him, and for which he was liable to be sued on landing. I am informed also that Mr. Phillips has lately sent to the State Department a claim against the United States of \$200,000 damages, for having been overawed, threatened, and endangered by the authorities of Cuba.

This is the man who tells us these horrible stories about the state of affairs in Santiago de Cuba. Moreover, having had these terrible stories published, I am told that he has sent to the State Department a disavowal of their truthfulness, saying that he wrote them under duress and to save his life; that they were written to pacify the people around him.

I have stated what I understand to be facts that can be verified by any one who will apply at the State Department. Now, before I propose to let my "blood boil," before I propose to abolish this consulate or to legislate in any belligerent way, I would like to have this person who cares so much for the honor of the American flag send back the money now in his hands, and belonging to the bereaved family of a noble man who was lately consul at Santiago. I should like to have him send word also about that man's last sickness—what he said in the hours of approaching death. I should like to have some response sent to the inquiries of the agonized widow, who has been beseeching for one utterance of her dying husband. But no answer has come to any such application. Let this man show some humanity to these people whom he has so cruelly wronged before he takes the care of the whole human race, and specially of all West India consulships, on his hands. He is busy pursuing his \$200,000 claim, for his having been troubled in his sovereign right as an American citizen upon the island of Cuba. I do not think it right that this House should go into an agony of indignation over a man who has behaved as that man has.

The Northern Pacific Railroad bill, passed by the Senate April 21, came before the House soon afterward, and met with very strong opposition, based for the most part on the objection to the policy of granting so large a proportion of the public lands to railroad companies. It is estimated that the number of acres certified and patented under grants to such companies, thus far, is 22,393,968, and that the number of acres inuring under such grants is 185,890,794, or over one-tenth of the entire public domain. The grant solicited by the Northern Pacific Railroad includes an area over five times the size of the New England States. The bill was passed by the House, May 26, 107 to 85.

In the Senate, April 28, a bill was introduced to relieve all persons engaged in rebellion from the disability imposed by the Fourteenth Amendment, excepting those who left Congress or the army or navy to aid the insurrection, and those who were members of State Conventions adopting ordinances of secession. No action has been taken on this bill.—The Senate, May 12, passed the Army bill, which differs from that previously passed by the House. It fixes the reduction of the army at 30,000 instead of 25,000. The section prohibiting retired officers from holding civil positions is retained, and an additional amendment extends this disability to all army officers.—In the Senate, April 25, a bill was reported relative to the subject of the enforcement of the Fifteenth Amendment. The House passed such a bill May 16. The bill introduced in the Senate, after numerous amendments, was passed May 21. A Conference Committee had to be appointed, whose report was adopted by the Senate May 25, and by the House May 27. The bill is a general one, regulating elections, and authorizing the President, in its execution, to use the army or navy if necessary.—A bill was

passed in the Senate May 2, and in the House May 13, for the relief of the widows and orphans of the officers and seamen lost on the *Oneida*, by the payment of one year's salary.—Among the amendments agreed upon by the Senate to the Appropriation bill was one (May 11) granting \$500,000 for a new building for the State Department, and another for the enlargement of the Capitol grounds at a cost of \$500,000; an amendment allowing the appointment of female clerks in any of the classes of clerkships in the Departments (May 23), and another (May 27) giving equal pay to male and female clerks; also an amendment was agreed upon by both Houses, granting \$100,000 for an expedition to the North Pole.

A bill granting a life annuity of \$3000 to the widow of President Lincoln was passed by the House, May 2, by a vote of 85 to 77. The Senate Committee on Pensions decided that the annuity ought not to be granted.—The Senate, May 4, passed the House resolution to pay to the family of the late General John A. Rawlins a sum equal to his salary for one year.

The House, April 28, passed a bill for the establishment of an executive department to be known as the Department of Justice, of which the Attorney-General shall be the head. The bill provides for the transference to this new department of the Solicitor of the Treasury and his assistants, the Solicitor of Internal Revenue, the Naval Solicitor and Judge-Advocate-General, and the clerks, messengers, and laborers employed in the office of the Attorney-General, and in the offices of the Solicitor of the Treasury, Naval Solicitor, and Solicitor of Internal Revenue, and the law officer in the Department of State, now designated as the Examiner of Claims in said department.

Congress has determined to adjourn on the 15th of July.

The Judiciary election in New York State on May 17 resulted in the triumph of the Democratic party by over 85,000 majority. Folger and Andrews (Republicans) were elected as the two minority associate judges.

During the last week in May (25th, 26th, and 27th) an attempt was made by a portion of the Fenian organization to invade Canada. The expedition resulted in a complete failure. Two or three thousand men were pushed forward to the border, and a considerable quantity of military stores was accumulated. The movement, however, was anticipated by both the United States and Canadian authorities. At the outset President Grant issued a proclamation to enforce the neutrality laws. General O'Neill, who led the Fenians across the border near St. Albans, allowed himself to be arrested in the face of his army by United States Marshal Foster. Several other prominent Fenian leaders were also arrested. There was no serious fighting, and very few casualties.

EUROPE.

Early in the month our advices by telegram announced another conspiracy against the life of the Emperor Napoleon—the second since the beginning of the year. A large number of persons were arrested; one of these, Beaury, made a confession. The attempt to assassinate the Emperor was to have been made immediately

after the arrest of Rochefort, but for some reason failed. Important documents captured by the government, and the discovery of bombs and infernal machines, added to Beaury's confession, leave no room for doubt as to the reality of the conspiracy. Gustave Flourens, in London, and the president and other members of the International Society of Workmen, were implicated in the plot. The High Court of Justice was convened for the trial of the conspirators, some of whom were convicted and sentenced to short terms of imprisonment.

The vote on the *plebiscitum* was taken on the 8th, and resulted in a decisive victory for the Emperor. The vote stood, *Yeas*, 7,336,434; *Nays*, 1,502,709. Paris voted against the *plebiscitum* in the proportion of nearly three to two. In the army and navy the vote was in the affirmative six to one.—The election was followed by considerable disturbance in some quarters of Paris. Barricades were erected, and in the conflict with the military some blood was shed. But the riots were quickly suppressed, and on the 12th the Emperor and Empress, in an open carriage, visited the scene of disorder.—The *Journal Officiel* of May 16 announced the Duke De Grammont as Minister of Foreign Affairs in place of Count Daru, resigned.—On the 21st the Emperor met the legislative bodies in solemn assembly, and received from a deputation of the Corps Législatif the result of the vote on the *plebiscitum*. In reply to M. Schneider, who represented the legislative chambers, the Emperor made a speech expressing his gratitude to the nation for the signal evidence of its confidence. He said: "The *plebiscitum* had for its sole object the ratification, by the people, of constitutional reform. But amidst a conflict of opinions, and in the struggle with its opponents, its purpose became greater. Let us not regret this. The adversaries of our institutions have made the question one between the empire and a revolution. The nation has settled the question in favor of that system which guarantees order and liberty.....The votes which ratify those of 1848, 1851, and 1852 reaffirm your powers, and give you, like me, new force to work for the nation. Now, more than ever, may we be fearless of the future; for who oppose the progressive march of the *régime* which a great people founded amidst political troubles, and which is thus fortified in an era of peace and liberty?"

Spain still remains without a king. Espartero was offered the throne; but owing to his advanced age—seventy-eight—he declined. The project of an Iberian union has been much discussed. The latest advices indicate that there will be a consolidation of the regency. The draft of a law was read by the Colonial Minister to the Cortes May 28. It provides for indemnity to the master for children born of slaves since 1868, and that all born after the passage of the law shall be free.

In the Œcumenical Council, at Rome, the dogma of papal infallibility has been discussed; and, notwithstanding the opposition of one hundred prelates, and of the great powers of Europe, this dogma will probably be promulgated.

The British House of Lords, on the 19th, discussed the bill legalizing marriage with a deceased wife's sister, which has already passed the House of Commons. Lord Houghton and

the Marquis of Lansdowne favored the bill; but the spiritual lords in the House opposed it. The Earl of Kimberley pronounced the proposed marriages immoral. The House refused by four majority to pass the bill to a second reading.—In the House of Commons, May 4, the bill for female suffrage was passed to its second reading, by a vote of 124 to 91. The question again came up on the 12th, and a motion to postpone was passed by a majority of 126. Mr. Gladstone attacked the bill, and denied that the country wanted female suffrage.—The Irish Land bill was passed by the House of Commons May 30.

The yacht race between the *Cambria* (English) and the *Sappho* (American) resulted, on the third trial, May 18, in the victory of the latter.

Mark Lemon, the editor of *Punch*, died May 23, at the age of sixty-one.

A party of English travelers, consisting of Lord and Lady Muncaster, Mr. Herbert (Secretary to the British Legation), Count Boyl (Secretary to the Italian Legation), Mr. and Mrs. Lloyd, with their child, five years old, and Mr. Vyner, were ambushed and captured on the plain of Marathon, a short distance from Athens, by a band of brigands twenty-eight in number. The party had left Athens that morning (April 11) in carriages, and under the escort of four mounted *gens d'armes*. The bandits hurried their captives away, and the next day released the ladies and child, and allowed Lord Muncaster to return to Athens to raise the sum demanded for the ransom of himself and his four companions. The sum (\$100,000) was raised; but it was found impossible to obtain from the Greek government an amnesty for the brigands. A Greek officer, however, was sent to inform the brigands that, if they would take the money and release their captives, they could go on board a British ship of war, and leave the country for Malta; but they would not be permitted to quit the neighborhood of Oropos, where they had taken refuge with their captives, and where they were surrounded by a force of 600 soldiers. The brigands would not accept these terms, but insisted on an amnesty for all their crimes, and refused to remain at Oropos, threatening to kill their captives if their march was opposed. They set out accordingly, without waiting for the return of Lord Muncaster, and were pursued by cavalry. On the approach of the troops they shot Mr. Herbert and Mr. Lloyd. In the fight that ensued six brigands were killed. The others fled, taking with them Mr. Vyner and Count Boyl, whom they killed at Skimatari. This affair has created intense excitement in England.

SOUTH AND CENTRAL AMERICA.

There are the usual conflicting reports in regard to the war in Cuba. General Goicouria, a prominent Cuban leader, has been captured. He was brought to Havana May 6, was taken to jail, tried by a court-martial, and was garroted on the 7th.

Advices of May 22 announced the success of the revolution in Venezuela. The capital was captured, April 27, by General Guzman Blanco, after two days' hard fighting, and General Blanco was installed as Provisional President. President Monagas, who had been at the head of the government for two years, surrendered with the remnant of his army.

Editor's Drawer.

NOTHING, it seems to us, could be more consolatory to Mr. Greeley than to be assured, on quite credible authority, that after his editorials in the *Tribune* have had all the mental effect to which their merits entitle them, they are afterward made the instrument of working almost miraculous curative results on the system of the unwell Syrian. As proof, we have the following, related by the Rev. Dr. Jessup, an esteemed missionary in that country, who says:

"A Hakeem, or native doctor, one day came to me and asked for a few old newspapers, to which appeal I responded by the gift of a few well-worn copies of the New York *Tribune*. A fortnight after the grateful recipient came back to me in wonderful spirits, and thanked me most heartily for the gift, inviting me to go and eat grapes and figs in his vineyard, saying, 'I thank you very much for those old journals. There is nothing like them; they have worked wonders for my patients!' What was my surprise, on entering the house of the quack, to be invited to look into an earthen jar, in which these newspapers had been soaked to a pulp in water and then in olive oil, quantities of which astounding mixture had been swallowed by this fellow's credulous patients with such amazingly beneficial results! The old Hakeem gravely thought it was the magical charm of the printed letters which did the business."

Nothing like boiled *Tribune*!

In the "Life of Bismarck," just published by the Harpers, occurs the following original anecdote of Humboldt: During the eventful Berlin days of March, 1848, when barricades were the order of the day, a mob came rushing into the Oranienburger Strasse, where Humboldt resided. Materials for a barricade were required, and every door was besieged for the purpose. One of these opened, and a venerable-looking man presented himself, and begged the excited mass not to disturb him. Such a request was not to be borne by the sovereign people, and he was asked menacingly who he was, that he should use such language. "I am Alexander Von Humboldt," was the quiet reply. In a moment every hat was off, and with reverent greetings the multitude swept forward, and left the scholar and philosopher at peace.

In the way of neat advertising we have seen nothing better than the following notice of the "Alleghanians," in the local column of the *Atchison Champion and Press*:

"The prayer-meeting at Presbyterian Hall will commence thirty minutes before the usual hour, and close a little before eight o'clock, with a view to afford opportunity of attending the concert by the Alleghanians."

This style might be adopted by various caterers for public amusement—as, for example: "The monthly concert of prayer, which was announced for Monday evening, has been postponed till Tuesday, in order to give the congregation an opportunity to hear Skiff and Gaylord's minstrels, in their justly celebrated," etc.; or, "The protracted meeting which has been going on for some weeks in our village will close to-morrow

evening in time to allow the people to see Yankee Robinson in his inimitable delineation of down-east character," or words to that effect.

SOME years ago, at Washington, during a session of Congress, the parlors at Willard's were enlivened during the evenings by the show and the chat of "fair women and brave men." Then, as now, they resorted to the capital to sharpen their axes, serve the country, get married, or have a good time. One evening, in the throng that promenaded through the halls of the hotel was a member of Congress from a Western State, accompanied by his daughter, who had greater familiarity with modern novels than with modern languages. Passing by General Sam Houston, who had upon his arm a stylish young woman, she was asked by her young gentleman companion how she liked their appearance; to which, with the frankness of a daughter of the West, she replied: "The dress of the lady is elegant, but as for General Houston, his whole *tout and scramble* is awful!"

THE Drawer has found in a volume of poetry, called, "Asylum for Fugitive Pieces," published in London, in 1786, by Debrett, the origin of the phrase "Solid men of Boston." It commences:

"Come, listen neighbors all, and I'll tell you a story
About a disappointed Whig who wants to be a Tory;
I had it from his bosom-friend, who very soon is
going
To a prison for seven years for something he's
been doing.
Solid men of Boston, look to your houses;
Solid men of Boston, take care of your spouses;
Solid men of Boston, go to bed at sundown,
And do not lose your money to the blacklegs
of London."

It is related of a certain Connecticut minister that one Sunday morning, as he was on his way to exchange with a brother clergyman, he met the brother, who said to him, "My mother-in-law is failing, and will probably request the prayers of the church, in which I would unite." Between services Mr. B—— went to see the old lady. He asked whether she would like to have prayer offered for her recovery. "No; why should I? I have lived out my days, and want to get home." That afternoon the congregation was astounded with the following notice: "Mrs. P—— desires the prayers of this church that she may die. Her son-in-law, Rev. P—— S——, unites in the request!"

THE train for Boston having left Twenty-seventh Street at 8 P.M., a passenger was making a desperate attempt to read by the feeble light of the single lamp that was burning in the car. Abandoning his paper in disgust, he was inveighing against the penuriousness of the wealthy corporation, which he styled niggardly. "Niggardly!" echoed a neighboring passenger; "any *decent* nigger would be ashamed of it!"

It is well remembered by army officers that of the various delicacies distributed by the civilian delegates of the several commissions and relief agencies the major part was obtained by a

class of patients who made the most noise, and not by those who were sickest.

It was after Gettysburg, when the corps hospital was crowded with wounded, that, while dressing a slight wound, the patient suddenly started up, as a delegate of the Christian Commission passed the tent, and asked, "Warn't that a Christian?" "Yes." "Jove! but *I forgot to groan!* Well, that's the first one of them I've missed yet. *I wonder what he had?*"

THE tail of the Shanghai has at length come to be made the subject of official investigation in Congress. On the 2d of April last, in the regular order of business in the House of Representatives, occurs the following, which we quote from the official report in the *Globe*:

"The Speaker also laid before the House a communication from the Secretary of the Treasury, in relation to the value at which the 'tail of the shanghai' is, by instructions of the Department, now taken at the various custom-houses of the United States; which was referred to the Committee on Foreign Affairs, and ordered to be printed."

It is gratifying to know that the exact money value of the tail of the Shanghai rooster is at length to be adjudicated upon by Congress. Hitherto prices have fluctuated so widely as to embarrass those engaged in the regular trade. It is just possible, however, that the Secretary of the Treasury meant that action should be taken on the *tael* of Shanghai, a coin worth about \$1 50. But we are not clear on the subject.

A BOSTON correspondent assures us that the following, one of the many funny anecdotes that Portsmouth, New Hampshire, people tell of Mr. Webster, has not appeared in print:

During Mr. W.'s residence in that city, in his younger days, there was a furniture-dealer named Judkins doing business in the town, who was a very well informed as well as ambitious man. He was patronized by Mr. Webster, who often dropped into the shop to order or superintend the making of some piece of furniture. These opportunities of conversing with a man so learned as Mr. W. were the delight of Mr. Judkins's life; and on the removal of the former to Boston, the payment of a considerable debt due Mr. J. was willingly left for future settlement. Attempts were made at various times to collect the debt—always in vain. Finally, Mr. Judkins determined to go to Boston and see Mr. Webster himself. He reached the city after a long and fatiguing stage-ride, and, making a Sunday toilet, proceeded to the large house on the corner of High and Summer streets. "Is Mr. Webster in?" asked he of the servant who answered the bell. "Yes, but he can not possibly be seen." "But I must see him." "No; he is entertaining some Washington gentlemen—they are dining." Mr. Judkins had heard of subterfuges, and believed not the serving-man. "Well, I will come in and wait till dinner is over." The puzzled servant, needed below stairs, decided to take the importunate stranger's name to his master. Fancy the surprise of Mr. Judkins at seeing Mr. Webster rushing up stairs and insisting upon the poor man's joining his friends at the dinner-table! He would take no denial, and carried him forcibly almost, introducing him as "my old and dear friend, Mr. Judkins, of Portsmouth," and seating him between a distinguished Bostonian

and the Secretary of the Navy; and, to use the words of the worthy cabinet-maker, "I was for four mortal hours just as good as any body; my opinion was asked on a good many subjects, and they all seemed to think I knew a good deal. I was invited to visit them, and to go to Washington, and every body asked me to drink wine with them; and, by George! I made up my mind never to ask for my bill again. I was a poor man, and needed my money, but I had been treated as I never expected to be treated in *this* world, and I was willing to pay for it."

DR. M'L—, Reverend and M.D., preached and practiced some years ago in West Virginia. A native of Ireland, he still retains much of the brogue, although many years a resident of this country. There lived with him a lad who was one of the worst boys the great West was known to have produced. One night this bad William, being at a protracted meeting, was so thoroughly aroused to the danger of his condition that he concluded to go forward to the altar. The Doctor was within the chancel at the time, and seeing Bill coming forward, cried out, "Make room there! make room! *here comes the very ould divil himself!*"

ON another occasion he took for a text the parable of the Prodigal Son. He described very graphically the wretchedness and destitution of the young man when he was feeding swine, and, to cap the climax, exclaimed, "It was a God's mer-r-cy [rolling the r] that he didn't take a pestol and blow his brains out!"

IN Illinois, at least, the "man and brother" seems to have an idea of the upshot of recent Congressional legislation, although the manner of expressing it may be open to criticism. On election-day at Decatur, Illinois, Dick White, a well-known colored gentleman of that place, made the somewhat sarcastic observation: "De white folks am mighty polite to us cullud men since dey passed de *Fifteenth Commandment!*"

A GENTLEMAN of jocose views riding with some ladies at Elizabeth, New Jersey, a few days since, was informed by one of them, as they were approaching the new hotel, that it was the "Sheridan House," and had just been opened. "Ah, indeed!" responded "old Mustache." "Well, I suppose the next thing in order, and certainly the most natural desire on the part of the proprietor, will be to 'Phil' it immediately."

NOT long ago a fire company in one of our rural villages paid a friendly visit to a neighboring town. Of course the village band was out, and a cordial reception accorded the visitors. A dinner was given by the village authorities, to which the band was very properly invited. After dinner came the toasts, when a gentleman present gave, "The M— Fire Company and the P— Band; the latter *great blowers*, the former *perfect squirts!*"

THERE was a certain quaintness of humor in the manner adopted by the late Mr. Wm. W. Cornell, the iron manufacturer of this city, in making donations for religious and charitable objects. It was a sort of habit of his to connect

himself with churches of his denomination (Methodist) that were in debt, and whenever he undertook to have a debt paid off, his rule was to assume half the amount himself, but he had a pleasant way of doing it. For instance, he took the floor to make personal solicitations. His own donations ostensibly were small; but he would subscribe in the name of other people, partly to hide his gifts, partly to shame the penurious. Going to a pew where a reluctant but well-to-do member sat, and who declined to subscribe, he would pass on to a poor widow or sewing-girl, say a word to the parties, and then shout out: "Widow Jones, \$500." "Sister Kennedy, \$150." A mechanic thought he could spare \$10; the subscription was shouted out for \$100. The General Superintendent of the city was brought to his feet one night. He had agreed to subscribe \$50 for some purpose, and he heard his name announced for \$1500—half a year's salary. The subscriptions were not bogus. He made them all good. Such a man—genial, intelligent, catholic, untiring—is a great public loss.

DURING the winter of 1868-69 Bryant, as well as most other towns on the line of the Union Pacific Railroad, was so infested with desperadoes that a Vigilance Committee was formed, by whose summary procedure several of the worst offenders were hung; others were ordered to leave. Among the latter was one who was found leading his mule to the stable. He was informed, politely, of course, that if he did not leave town in fifteen minutes (an age!) he must abide the consequences. His reply was: "Gentlemen, if this mule don't 'buck,' I only want five." The mule did not "buck," and his owner is now an "honest miner" in Nevada.

This incident reminds us of a remark made by an eminent judge, who deprecated every thing approaching to mob "law." Said he: "I have never read of an instance of 'Lynch law' where substantial justice was not meted out."

It's some time since the Drawer has had a Munchausenism. To the thoughtfulness of a Dayton, Ohio, correspondent we are indebted for the following:

An old English gentleman, a school-teacher, who some years ago resided in one of the small towns of Ohio, was an agreeable teller of stories, but deemed it beneath his reputation as a *raconteur* to tell one that did not surpass any that had preceded it. A farmer having come to the village remarked, in the presence of his friends, that he had been plowing all the week with four horses, breaking up new ground, and dwelt upon it as being a very "big thing." "Pshaw!" said the old Englishman, "that's nothing. I have seen in England fifty yoke of oxen hitched to one plow!" The remark seemed to occasion general surprise. "And," continued he, "the funniest part of the whole thing was, that while the plow was on the top of one hill, the leading yoke of oxen was on top of another hill, and the forty-nine between the plow and the leaders were suspended between the two hills! And there was another matter connected with it rather strange. In the course of the day the plowman, becoming rather careless about driving his team, ran into and split a big oak stump! The plow passed

safely through the split, but before the plowman got entirely through it closed up and caught him by the coat-tail!" "Did it tear his coat?" asked a person of inquiring turn. "Not a bit of it!" replied our veracious narrator; "he hung on to the plow-handles and pulled out the stump!"

THE working of miracles seems to have been successfully resumed in Piqua, Ohio. A few years since, during a religious revival in the church of which the Rev. Granville Moody was pastor, certain "lewd fellows of the baser sort" created a disturbance in one of the meetings. Mr. Moody, approaching them, took them to task for their misconduct, when one of the parties said to him:

"We heard that you were working miracles here, and came to see if it were true."

"No, Sir," said the divine, "we do not work miracles, but"—taking him by the collar—"we do cast out devils!"

And he "drove him out."

SOME years ago a Methodist minister named — occupied the pulpit of that denomination in Hagerstown, Maryland, and throughout the Conference year took frequent occasion to berate his flock. In consequence of these repeated attacks a goodly number of the brethren severed their connection with the church, determined not to return until the parson should be transferred to some other field of labor. It finally became known that the irascible — was to preach his farewell sermon, and scores who had been scored by his caustic strictures, thinking that he would say something in his valedictory to atone for the severity of his language toward them, turned out to hear. For half an hour he confined himself to an elucidation of his text, and then alluded to his separation from them. Said he: "There are some decent people in Hagerstown, and some mean ones; yes, some who are mean enough to steal the cross of Christ for fire-wood, and sell His clothes for rags. There are men before me who have grown gray in the cause of the devil; whose hearts are hard enough to build a turn-pike between Hagerstown and hell; and I believe that there's just that spirit at work here that will see the enterprise put through!" An Irishman in the rear end of the meeting-house, no doubt indignant at the parson's remarks, bawled out: "And wouldn't ye, old man, be willin' to be a toll-gate keeper on that road?"

WE all remember how, some years ago, it was deemed funny by the boys to say, "Not the sloughest dight of it," "Not a dif of bitterness," etc. Talking the other day with a gentleman of the editorial persuasion, he mentioned a ludicrous instance of the same style of talk by an eminent butcher in a Western city, who, at some public entertainment, wishing to apostrophize the Federal banner, said:

"Forever fleet that standard shoat!"

ELDER WATSON, of North Carolina, was called upon to baptize by immersion Brother Smith and his wife. Both were old, and had recently made a profession. The husband was famous for his frequent d—s, but it was hoped that this habit was now buried at the foot of the hill where Pilgrim's burden rolled out of sight. But habit

is second nature. The old couple were led into the water, the husband going first and leading his wife, as he was led by the minister. The water was cold—very cold. Scarcely had the old lady touched the liquid element when a “Ugh! ugh!! *ugh!!!* U-G-H!!!!” was heard, growing louder and louder, accompanied by deeper inspirations as the water grew deeper. When up to her waist, and fear was added to chilliness, the crowd twittered quite disreputably. The old man could bear it no longer. He had been writhing under pain at his wife’s conduct. Jerking his hand from the minister’s, he placed in the hand of the successor of the apostle the hand of his wife, saying, “Here, Mr. Watson, you’d better take hold of the old woman’s hand, for she is the d—dest fool about water you ever seed!”

WHEREVER one travels he finds in the graveyard, be it in town or country, epitaphs so curious and comical that, despite the solemnity of the place, they beget the irresistible smile. Below are a few fresh gleaned from English sources:

“Here lies buried beneath these stones
The beard, the flesh, and all the bones
Of the Parish Clerk—old David Jones.”

In Ashton church-yard:

“Too much blood a vein did bust,
And stretched Tom Tucker down in dust.”

“Here lies the body of William Dent,
Death turned up his heels, and away he went.”

“Here lies Dick, and here lies he,
Hallelu-jar—Hallelu-gee.”

In a Cornish church-yard:

“Here lies the body of Joan Carthew,
Born at St. Columb, died at St. Kew;
Children she had five,
Two are dead, and three are alive;
Those that are dead choosing rather
To die with their Mother than live with their
Father.”

On a man and his wife, in the church of Quorndon:

“He first departed—she a little tried
To live without him—liked it not and died.”

In the same church, on a person named Cave:

“Here in this Grave there lyes a Cave,
We call a Cave a Grave;
If Cave be Grave, and Grave be Cave,
Then, reader! judge, I crave,
Whether doth Cave here lye in Grave
Or Grave doth lye in Cave?
If Grave and Cave here buried lye,
Then Grave where is thy victorie?
Go, reader, and report here lyes a Cave
Who conquers death and buries his own Grave.”

Another:

“The Lord saw good I was lopping off wood,
And down fell me from the tree;
I met with a check, and I broke my neck,
And so death lopped off me.”

Another:

“Here lies entombed old Roger Norton,
Whose sudden death was oddly brought on:
Trying one day his corn to mow off,
The razor slipt and cut his toe off.
The toe, or rather what it grew to,
An inflammation quickly flew to;
The part affected took to mortifying,
And poor old Roger took to dying!”

In Kenwyn church-yard, Cornwall. In memory of Thomas Cornish, who died Jan. 1, 1844, aged sixty-six years:

“My sledge and hammer lie declined,
My bellows’ pipes have lost their wind;
My fire’s extinguished—coal decayed,
And in the dust my vice is laid;
My iron’s wrought, my life is gone,
My nails are drove, my work is done.”

[Over the above inscription is a sculptured representation of a smith’s shop, with shoes, nails, anvils, tongs, etc.; it is, therefore, needless to say that the person whose name it is intended to perpetuate was a blacksmith, who had his anvil, etc., buried with him.]

THE snow was so deep in Cheshire County, New Hampshire, last winter, that it was difficult for persons meeting with teams to pass. An eccentric citizen, well known in that county, and having a defect in his speech, was coming to the village with a horse and sleigh, and being about to meet a stranger with a team, exclaimed, “Turn out! turn out! my father’s dead!” Upon which the stranger, with much difficulty, turned out and gave him the entire road. After he had got fairly by, the stranger turned and inquired of him when his father died; to which the grief-harrowed citizen responded that his venerated parent had peacefully sunk to rest “about fifteen years ago!”

Now that the time has come for military encampments, we beg leave to suggest to the various colonels of General Shaler’s division the importance of reading up in tactics, and to submit, as part of an effective drill, the following:

When the Twenty-third Missouri was organized (late “disturbance,” etc.), many of the officers were decidedly green in matters military. Captain —, having seen the “right wheel” executed, determined that his company should be drilled in the same manœuvre. At the next drill he scratched his head in vain for the word of command, and substituted the following: “Come round like a gate! in *one* time and *two* motions! COME!”

IN India and Indiana the laws in reference to divorce are quite unlike. In the latter State the popular legend is that all trains of cars passing through Indianapolis tarry full fifteen minutes for divorce; whereas, under the penal code in India, there is a criminal side to the divorce court, and, literally,

“He that loves what isn’t his’n,
If he is caught, he goes to prison.”

WE have tidings from Boston of a clergyman of Massachusetts who, on exchange, preached in a brother’s pulpit. Taking up a note which he found when he opened the Bible, he read that Brother — requested the prayers of the church that the loss of his wife might be blessed to him, etc. The preacher prayed most fervently. To his amazement and mortification he found afterward that the note had lain in the Bible a year, while the bereaved gentleman was on this Sabbath sitting with a new wife in the congregation!

EVER to be respected is honest grief! When one’s wife becomes defunct anguish is especially reputable. A case in point comes from a rural quarter, where a fine old farmer thus apostrophizes the memory of his better half:

“Thus my wife died. No more will those loving hands pull off my boots and part my hair

as only a true wife can. No more will those willing feet replenish coal hod and winter pail. No more will she arise, 'mid the tempestuous storms of winter, and gayly hie herself away to build the fire, without disturbing the slumbers of the man who doted on her so artlessly. Her memory is embalmed in my heart of hearts. I wanted to embalm her body, but I found that I could embalm her money much cheaper.

"I procured from Eli Mudget, a neighbor of mine, a very pretty grave-stone. His wife was a consumptive, and he had kept it on hand several years, in expectation of her death. But she rallied that spring, and his hopes were blasted. Never shall I forget this poor man's grief when I asked him to part with it. 'Take it, Skinner,' said he, 'take it, and may you never know what it is to have your soul racked with disappointment as mine has been.' And he burst into a flood of tears. His spirit was indeed utterly crushed.

"I have the following epistle engraved upon the grave-stone:

"To the memory of Tabitha, wife of Moses Skinner, Esq., gentlemanly editor of the *Trombone*. A kind mother and exemplary wife. Terms, two dollars a year, invariably in advance. Office over Coleman's grocery, up two flights. Knock hard. "We shall miss thee, mother; we shall miss thee, mother; we shall miss thee, mother." Job printing solicited."

"Thus did my lacerated spirit cry out in agony, even as Rachel weeping for her children. But one ray of light penetrated the despair of my soul. The undertaker took his pay in job printing, and the sexton owed me a little account I should not have gotten in any other way. Why should we pine at the mysterious ways of Providence and vicinity? (Not a conundrum.)

"I here pause to drop a silent tear to the memory of Tabitha Ripley, that was. She was an eminently pious woman, and could fry the best piece of tripe I ever slung under my vest. Her picked-up dinners were a perfect success, and she always doted on foreign missions."

BEFORE the Constitution of New York of 1824 the Common Pleas and Court of Sessions was held by a first judge and at least two associate justices. At a term of such court, held in one of the northern counties of this State, the first judge, on his way to court, was kicked by an old man in half-drunken sport. A witness of the occurrence made complaint to the grand jury, who found an indictment. On the old man being arraigned the first judge quitted the bench, leaving the matter to be disposed of by the assistant-justices. The old fellow pleaded guilty, expressed sorrow for his act, and was fined five dollars. The first judge resumed his seat on the bench, glared at the assistant-justices on the right and on the left, in great apparent indignation and contempt, remarking, seemingly to himself, but loud enough to be heard throughout the room, "If it costs only five dollars to kick a first judge, I should like to see the American coin small enough to designate the penalty for kicking off their seats a full bench of assistant-justices!"

A LITTLE news-boy of Pittsburg lately entered a drug store to serve the proprietor, who was one of his regular patrons. Not finding him in the store, he concluded to look for him in the room in rear. Imagine the astonishment and horror

of the youth, upon opening the door, to behold a skeleton suspended from the opposite wall. Never having seen one of "them ar," and being afraid lest the chemist might make bones of him, he retired as fast as his blessed little legs could carry him. In his retreat he ran full tilt against the druggist, just coming in. That worthy man, imagining the boy had been stealing something, "went for him." Being very thin, and about the height of the skeleton, the boy came to the conclusion that they were identical, and ventilated that idea thus, as he dodged his pursuer: "No you don't, old Bones!—you can't catch me, if you have got your clothes on!"

IN Dr. King's "Anecdotes of his Own Time" is the following, which we do not remember to have seen in print in this country:

Atterbury, Bishop of Rochester, when a certain bill was brought into the House of Lords, said, among other things, "that he prophesied last winter that this bill would be attempted in the present session, and he was sorry to find that he had proved a true prophet." Lord Coningsby, who spoke after the Bishop, and always spoke in a passion, desired the House to remark "that one of the right reverend bench had set himself forth as a prophet; but, for his part, he did not know what prophet to liken him to, unless to that furious prophet Balaam, who was reproved by his own ass." The Bishop, in a reply of great wit and calmness, exposed this rude attack, concluding thus: "Since the noble lord hath discovered in our manners such a similitude, I am well content to be compared to the prophet Balaam; but, my lords, I am at a loss how to make out the other part of the parallel; I am sure that I have been reproved by nobody but his lordship!"

MACARONIC VERSE seems happily adapted for a neat way of "putting things," especially things political, where there is a desire

"To blend in one the funny and the fine."

In the famous Tippecanoe and Tyler contest of 1844, one of the notable anthems that formed the main staple of the campaign was "That Same Old Coon." And thus we find it commented upon in mixed French and English:

CE MEME VIEUX COON.

Ce meme vieux coon n'est pas quite mort,
Il n'est pas seulement napping:
Je pense, myself, unless j'ai tort,
Cette chose est yet to happen.

En dix-huit forty-four, je sais,
Vous'll hear des curious noises;
He'll whet ces dents against some Clay,
Et scare des Loco—Bois-es!

You know que quand il est awake,
Et quand il scratch ces clawses,
Les Locos dans leurs souliers shake,
Et, sheepish, hang leurs jaws-es.

Ce meme vieux coon, je ne sais pas why,
Le mischief's come across him,
Il fait believe he's going to die,
Quand seulement playing possum.

Mais wait till nous le want encore,
Nous'll stir him with une pole;
He'll bite as mauvais as before—
Nous pulled him de son hole!

JUDGE B——, of one of the river counties, was not only a wag, in his way, but a great pedestrian. In one of his long tramps he was overtaken by a gentleman driving a carriage, who

asked the Judge to ride. Looking a moment at his friend, the Judge replied, "No, thank you; when I get so low as to want to ride, I will speak to the sexton!"

IN one of the judicial districts of this State was a certain judge of the Supreme Court much given to doubting. He was constantly in the habit of responding to propositions of counsel by saying, "I don't know about that." On one occasion, when acting as presiding judge, a sharp, shrewd counsel, who had been much annoyed by this kind of response, at last, quite out of patience, stated, with a small grain of mischief, an elementary principle of law; to which the judge, as was his wont, replied, "I don't know about that, I don't know about that." The counsel paused, looked the judge squarely in the eye, and said, "I *knew* your Honor didn't know, and that's why I told you!"

ON the other hand, there are occasions when judges can not resist the impulse to be a little facetious on the bench, as was the case with an English judge, who addressed a criminal who had been sentenced to death for uttering a forged £1 note in this wise: "I trust that through the merits and mediation of our blessed Redeemer, you may there experience that mercy which a due regard to the credit of the *paper currency* of the country forbids you to hope for here."

WE are indebted to a correspondent at Lincoln, Nebraska, for an anecdote of Governor David Butter, which the Governor used to tell with great glee:

Not many years ago—but before Lincoln, the capital, had an existence—the Governor was "stumping" the State (where a stump is a great rarity), and as darkness came on ere his destination was reached, he halted for the night at the hut of a hardy pioneer; and, as room was scarce, the Governor was assigned to a bed with Pat. As they were preparing for the couch the Governor said, "Well, Pat, you'd live a long time in the old country before you could sleep with a Governor." "Yis," said Pat; "an' it wud be a longer time afore the likes of ye wud be Governor!"

AN artist in Connecticut relates and illustrates this poetic incident: "The following specimen of grave-stone literature may be seen in a country grave-yard in Trumbull, in this State. I am a marble-worker, and engraved it on the stone myself according to the directions given me.

"Our father lies beneath the sod,
His spirit's gone unto his God;
We never more shall hear his tread,
Nor see the *wen* upon his head."

MADAME B——, a French lady of the "upper ten," having said, in her intense style, "I should like to be married in *English*—in a language in which vows are so faithfully kept," a listener asked a wag, "What language, I wonder, was *she* married in?" To which his friend replied, "*Broken English*, I suppose."

AN English literary journal, the *Spectator*, has recently published a few anecdotes illustrating "The Grotesque in Religion"—stories which combine the strangest freaks of grotesque fancy with genuinely religious ideas. We quote an Irish legend—a very old one:

Our Lord, walking with St. Peter, asks for admittance into a peasant's hut for the night, when they are most hospitably received. When leaving the next morning St. Peter, with that forwardness of initiative of which the gospels give so many instances, urges his Master to reward the peasant's hospitality. "I think not. It is better as it is," was the reply. "It's a shame for you," says St. Payter—the story is supposed to be told by an Irish peasant—"you *must* do something for him," an admirable dramatic touch, showing how well the character of St. Peter is understood, and how thoroughly it has been realized by the common people. Whereupon our Lord gives way, and tells his entertainer to look in a certain place, where he will find a piece of money. The next year our Lord and St. Peter return by the same spot, and find a grand castle in the place of the hut. They ask for a night's lodging, telling that they are the same travelers who received it a year ago; but the powdered footman comes back with a sharp refusal, saying the place is no hotel, and slams the door in their face. Whereupon, after a brief silence, says our Lord to St. Payter, "*I told you so.*" Both the unconscious and the conscious elements of humor in this story are very conspicuous. The dictatorial urgency of St. Peter's impulsiveness, and the child-like triumph of the retort with which the Divine Master impresses his superior wisdom on the blundering apostle, are curious enough instances of the colloquial familiarity with which religious ideas are treated in popular legends of this class.

WHILE the Third Vermont regiment was encamped near Kearnsstown, Virginia, some of the officers made the acquaintance of two Southern ladies living near camp. The ladies being short of reading matter, requested the loan of any books the officers might have. One of the officers promised to send one, and on reaching camp dispatched an orderly with Hugo's *Les Miserables*. The orderly soon returned, bringing back the book, stating that Miss —— had directed him to say she had no need for such a work. Wishing to know why the book was returned before it was read, he called in the evening and inquired why she had returned the book. Had she read it? The lady replied, "No, Sir, I have never read the book, and never wish to; you ought to be ashamed to send me—a Southern lady—such a book! I know our soldiers are poorly clad, and suffer for want of proper food, but they are not *Lee's Miserables*, as you Yankees represent them to be!"

Not being in mood disputatious, the gory Third Vermonter retired in good order.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXLIII.—AUGUST, 1870.—VOL. XLI.

THE RAQUETTE CLUB.

THE DISMAL WILDERNESS.

THIS celebrated Club of incipient anglers met pursuant to adjournment, the professor in the chair. By the rules of its organization the professor was made perpetual president. He was the creator of the Club, its source, and vital principle. So long as he moved, the Club performed its functions; when he ceased, the Club died necessarily. The office of president, therefore, could not be elective.

Regarding the Club as his especial charge, the professor employed his every effort for its individual advancement and his own glory. In his preceptive capacity as a professor of piscatorial polity he never ceased to impose "line upon line," nor hesitated to use the *rod* whenever required. He moulded crude ideas with plastic hand, feeling that nothing was more essential to a *perfect cast* than a good "leader." Hence, and consequently, a halo of rose-tinted

auspices surrounded his endeavors. The calm surface of his morning-tide gleamed with omens of a speedy "rise." It is no marvel, then, when he rose to rap the Club to order, that his large-bowed spectacles beamed with a benignant blue—that his hoary beard grew radiant with underlying smiles, as mountain mists are illuminated by the sun.

"My worthy neophytes," said the venerable fish-persuader, "before we proceed to business I must state that no candidate can be admitted who has ever fished with a fly or drawn a bead upon a deer. Are all present novices?"

"We are!" (Full chorus, with click-reel accompaniment.)

"Then I greet you in the name of the immortal Izaak, whose mantle I wear. You now enter fairly upon what may be aptly termed your *no-fishiate*. Since all are duly qualified, I receive you into full fellowship, according to usage, upon the point of a Limerick and the angle of a true sportsman.

"The object of this Club, gentlemen, is proficiency in the gentle art. By your own con-

Entered according to Act of Congress, in the year 1870, by Harper and Brothers, in the Clerk's Office of the District Court of the United States, for the Southern District of New York.

VOL. XLI.—No. 243.—21

THE PROFESSOR.

fession you are at present merely fish-killers. Attain forthwith to the dignity of complete anglers. Let your hand attest its cunning; and remember that, in taking a trout *secundem artem*, a single feather may suffice to turn the scale." (Sensation.)

"Also, it is incumbent upon each member to write a book. The man of the present age who don't write a book is a mere cipher. Sportsmen, especially, should be natural-born authors. Their inspiration is like real Burton ale—drawn direct from the 'wood.' It needs no 'bush.' Your achievements will look glowing in print, and redound to your own fame. Thenceforward the public will accept you as authority in all matters relating to sporting. And you will have only to introduce yourselves as members of the Raquette Club to receive that consideration which your merits will compel."*

Just here the professor seemed to have run off all his line, and his subject took bottom and "sulked," as they say in sporting parlance.

While he recovered his slack the Club made mutual acquaintance.

Analytically treated we discover a hydro-pathic doctor named Ollapod; Musquash, a lawyer; Tipstaff, a typo; and one Nugget, sexton, geologist, and practical gravel-scratcher; besides old Fudge, the professor, whose name, by-the-by, we have irreverently neglected to mention before. These constituted the *dramatis personæ* of the Raquette Club—a club (to judge from its name and components) des-

* The professor is altogether too dogmatic. He is evidently suffering from that species of strabismus which so often affects the private "I." Egoism is a malady from which neither sportsmen nor authors are exempt. Every eye has its own limited horizon. When it makes a new discovery it is apt to imagine the rest of the world in relative darkness, and in its haste to enlighten its fellows exposes its own ignorance. There is little we learn but what somebody knew before. The simile, "drawn from the wood," is clever. Sporting literature is generally so effervescent with froth that it is difficult to detect the brew.

igned to make some noise in the world, even if it made no remarkable hits.

Upon comparing notes, confidentially, while the professor dozed, it came out that, although each member had avowed himself a piscatory enthusiast, the inveigling of fish was really a secondary consideration. In each case there was a private axe to grind. On the part of the geologist it was bad digestion. He swore he'd leave no stone unturned to put a keen edge on appetite. The doctor was a devotee to Agassiz's theory; he hoped to supply deficient brain-power by a generous fish diet. Tipstaff the printer—commonly called Topsy for short—was a gentleman by education, and a loafer by profession. One continual merry-go-round had made him a dizzy-pated youth; and now, in the decline of his convivial rampage, he determined to hie to the mountains and drown chronic compunctions of stomach in perennial streams of *Fishy* water.* Musquash was professedly in quest of derelict sportsmen who bagged game out of season. He was a member of Assembly, and in the interest of the game laws. Of Fudge, the learned professor—Fudge, the head, front, right-bower, capital, and cornerstone of the association—it would be unbecoming to say more than incidentally appears in the course of the narrative. His native modesty would shrink from panegyric; while at the same time to personally introduce to the reader a gentleman of such world-wide reputation—a *savant* so universally known—would be offensive to the last degree. It would be insulting to Fudge.

It was interesting to observe how quickly the incongruous elements of the Club coalesced when it was ascertained that fate had thrown their fortunes irrevocably together. Plainly Tipstaff would have a natural repugnance to the sexton, the sexton to the doctor, and the lawyer to every body in general; but meeting on common ground antipathies subsided. Surgeon and sexton, lawyer and printer, alike accepted each other as friends and coadjutors. Student as each was in some special department of the black-art, what tie more likely to prove congenial than the profession of an *angler*, whom some one has invidiously styled a "dealer in treason, stratagems, and plots—devoted to snares, traps, and subterfuges!"

Thus harmonized, the Club was the better prepared to receive the advice and instructions of its worthy president, who rose at this juncture.

"My friends," he said, with the proverbial solemnity of an owl, "I had intended to accompany this Club on its projected expedition, but now think it best to decline, for various reasons—"

* Common report attributes the authorship of these papers to this person. *Certes*, they are the only record of the Club's doings we wot of. We are the more ready to credit their paternity to Topsy, inasmuch as men and books are so alike in one respect—all they need is to get well "set up" in order to get into print.

The speaker was cut short at once by a general explosion, cries of disappointment, intimations of doubt, groans of dissent. Had Moses abandoned the Israelites on the shore of the Red Sea, the consternation could not have been greater.

"Oh, Fudge!"

"Shame!"

"Treason in the camp!"

"The game's up now!"

"Hear me, gentlemen," he pleaded. "Hear my reasons! In the first place—I say it with all due respect to the Club—I never fish except in the company of experts; and you are all mere tyros, by your own confession. Secondly, I prefer not to make the fifth wheel of a coach, so to speak. Four is a complete number. Four makes a party at whist, a quartette in singing, and the requisite number for the duties of camp-life. I don't sing, never play cards, and object to doing my own chores. I should be only a supernumerary. Besides, it will be better for you all to learn from experience—which is the best teacher. I will select your tackle, make you up some casts of flies, and give you all the necessary directions; then it will be your own fault if you do not succeed. I have selected the Adirondacks as the field for your exploits, which I've no doubt will fill many books. Your permanent camp will be on Raquette Lake, a beautiful sheet of water, whose fame—I speak modestly—is contemporary with mine. Possibly I may pay you a visit before the close of the season. Here is a copy of "Murray." Take "Murray" for your guide, and be happy.

"And now, my friends, since you start as a unit, let me express the hope that while you have a line left you will *all hang together*. When you wind up at last, may your *net* profits be large. Success to your fishing!"

The professor receded as gently as a tidal wave, leaving the drift high and dry. The coolness of his taking off was hyperborean. It was superlatively French. For a moment the Club was stunned, paralyzed, nonplused, dumfounded. Then its indignation found vent.

"Trepan him!" shrieked the doctor.

"Lay him out!" gasped the sexton.

"Quash his *non sequitur*!" snarled the lawyer.

"Pi his form!" cried the printer.

In vain! His radiant presence had vanished like a meteor's.

"Confound him!" said one. "The old humbug has imposed upon us!"

"Yes," chimed the sexton; "thrown dust in our eyes."

"Bamboozled us completely!" groaned the doctor.

"Started us off on a wild-goose chase after trout, and then given us the slip," said the printer.

"Who is he, any how?" demanded Nugget.

"His name is Fudge!"

"Exactly—quite apropos—don't know the first rudiments of angling, I'll warrant."

"He's a scaly fellow, at all events," ventured the printer; "though for my part," he added, "I am generally inclined to give the devil his due. The professor may not be so bad as he seems."

"Humph!" snapped the lawyer, "give the devil his *do*, and he will do *mischief*."

The Club having thus unsatisfactorily disposed of the professor, its next quandary was the "Adirondacks." Who was this Murray? Where this land of promise which their delinquent Moses had bespoken? This Arcadia of big trout and venison steaks? No one seemed to know. No one had even heard of it. Yes, by-the-way, Topsy had heard of it. He recollected having once set up a few "stickfuls" of a *Tribune* correspondent about that country, and, come to think of it, he had seen one or two sketches of the Adirondacks at the art galleries. They had been considered very creditable works of *Hart*, as the cockneys would say.

As far as his limited knowledge extended, this region had remained a *terra incognita* until explored by one John Brown, several years ago. After sending out one or two interesting accounts of his discoveries, John finally got lost, and nothing was ever heard of him afterward. Of course the entire scientific world was greatly shocked and excited. Successive expeditions were sent out in search of John Brown's *Track*. All were fruitless until one Arnold finally struck the trail, and followed it as far as the Fulton chain of lakes. There it was lost, and never recovered. As the footprints pointed toward the heart of the wilderness, it is believed that, while the body of John Brown perished in the swamps, his soul still continues to travel on. Arnold shantied in disgust, and few persons have since been bold enough to attempt the ghostly penetralia. There is a report, which is gradually gaining credence, that the spirit of John Brown has been occasionally encountered, of late, upon some of the nameless creeks of this region.*

At this juncture lawyer Musquash took occasion to remark that he had closely scanned the volume which Fudge had given them. (The lawyer always scanned—*plain prose* was a bore to him.)

"It is evident," he said, "that we are indebted to the author's indomitable endurance of hardship through protracted periods of persistent research for very fresh and valuable information. He has but completed the work which John Brown so heroically commenced. But for him we should have known scarcely any thing of the Adirondacks. Now we have every thing plain before us. Let's follow Murray, and carry out the original plans of the campaign."

"And renounce old Fudge?"

"If necessary, yes. We can do without him."

* This seems to be corroborated by Murray's legend of "Phantom Falls."

"Agreed!"

"A fig for Fudge!"

"Hurrah for Murray!"

"I tell you, my friends," continued the lawyer, with rising enthusiasm, "this Murray is no hearth-rug knight of the quill. He is a mighty hunter, like

'Nimrod the founder
Of empire and chase,
Who made the woods wonder
And quake for their race.'

It requires no little courage to brave the dangers of a mosquito swamp, *sans* tar and oil; to endure a salt pork diet for days together; to help the guide pack the traps over a 'carry' to save the time and trouble of going twice; and to get sap in your eye while sleeping out nights under 'the murmuring pines and the hemlocks.' There is a toothsome flavor of *fact* in the pabulum which this book provides; while at the same time (as some one has forcibly remarked of somebody or other) it 'has shed a sort of classical dignity over the angler's art, and even associated it with piety and poetry.'"

Here the speaker's enthusiasm wound itself up to so high a pitch that the mainspring snapped, and the Club adjourned.

How many meetings were held subsequently, to arrange for the day of departure, the record says not; neither is it clear as to the amount of time and energy expended in studying up "Murray" and gathering information from maps and experts, and in collecting the utensils and equipments requisite for roughing it in the bush. Certain it is that, about the 1st of July,

1869, the Club might have been easily recognized among the motley throng that crowded the Saratoga train bound north. It was obvious to the most casual observer that they were sportsmen *en route* for the "Adirondacks." Each member was attired in the most approved style of the craft—huge felt hats, capacious boots, velveteen jackets slashed with multitudinous pockets, guns and rods of assorted sizes and patterns strapped together, knapsacks, and woolen and rubber blankets. When they conversed it was in the style of old campaigners. They talked knowingly of the "Wilderness," black flies, wild-cats, and five-pound trout; frequently consulted maps, "Murray," and the "Railroad Guide;" and speculated upon the time they were to be due at specified points. Occasionally they paused to mark the effect upon their fellow-passengers, and, if they happened to catch a small boy listening with some show of attention, their faces shone with an effulgence of rapture.

"There's nothing like brass, you know," said Musquash, with a professional shrug. "By Jove! it is fortunate we got posted before we started. This hand-book is invaluable."

Just here a news-boy appeared and offered "Murray" for sale. The Club was bewildered at first—then indignant.

"Pooh, pooh! we have seen that book—no use for it whatever. By-the-way, my son, do you sell many of them?"

The juvenile pointed up and down the double range of seats, and behold! all the passengers were studying "Murray." The Club hadn't observed it before.

THE RUSH FOR THE WILDERNESS.

Presently the train rumbled up to the Whitehall Junction, and the conductor piped out, "Change cars for Rutland; passengers for Lake Champlain keep their seats!"

All kept their seats.

"I wonder where all these people are going?" asked Tipstaff.

They reached the steamer at Whitehall, and lo! the crowd came streaming down the pier and crushed into the gangway.

"Is this the way to the *Adirondack*?" piped a fat woman of forty as she paused on the plank. In an instant she was hustled out of sight.

The Club was aghast with wonder. Presently it clambered up to the promenade deck for safety and a better view. Immediately a small boy came up and proffered "Murray." Other small boys were observed to waylay the procession below and tender copies of "Murray." The procession was continuous. It was a moving phantasm of sea-side hats, water-proofs, blanket-shawls, fish-poles, old felts, mackintoshes, reticules, trout-rods, fish-baskets, carpet-bags, guns, valises, rubber boots, umbrellas, lap-rugs, hunting-dogs, water-spaniels, guide-books, and maps. There were old women, misses, youngsters, spinsters, invalids, students, Bloomers, correspondents, sports, artists, and jolly good fellows. Behind followed innumerable vans, crates, and barrows of miscellaneous baggage—Saratoga trunks, huge family trunks, Noah's arks, valises, corn-bins, bandboxes, hales, baskets, and boxes. Two packages of "Murray" and one case of "Hamlin's Magic Oil" brought up the rear.

When the steamer was fairly under way the members of the Club started on a reconnoissance. A gong admonished them to buy dinner-tickets. They asked a saloon boy the way to the office.

"Four times around the boat, Sir. Better be lively, gentlemen—first table is setting now."

The Club fell in at the rear of the column. When it reached the dining-room the third table was just cleared. While it was waiting it happened to notice that the steamer's name was *Adirondack*. Remarkable coincidence! Likewise the decorations of the boat were all suggestive of the land of trout and venison. Black-walnut deer stood out in bold relief on the panels. Strings of translucent fish gleamed in ground glass upon the state-room doors. Every thing was so successfully appropriate that, had it been gotten up expressly to order, it could not have harmonized more perfectly with the objects and aspirations of the Club. And yet, singular as it may seem, the Club was still so befogged by its first impressions, that it never dreamed its own little coterie was but a fraction of the grand aggregate whose destination was an irreclaimable wilderness. Naturally it didn't expect to find the latest ladies' fashions in an uninhabited region where even "hunters' cabins are fifty miles apart."

After dinner the obfuscation cleared a little. People became communicative. They gathered into little knots and groups to compare notes. A dashing young woman in Bloomer dress, who had been eying the Club for some time, ap-

proached with a certain kind of coyish assurance, and saluted.

"*En route* for the Adirondacks, I suppose, gentlemen?"

The Club returned an embarrassed assent.

"Been there before, of course?"

"Never." (Embarrassed dissent.)

"Mercy! Why, I took you for *guides*. Excuse me."

The Club nudged each other and fidgeted.

"Well, the fact is, madam—that is, miss," explained Tipstaff, "the fact is—h'm—we are a sporting club just returned from—yes—from the Rocky Mountains. As we hadn't got quite tired yet of hunting wild-cats and grizzlies—grizzlies, madam—we thought we would amuse ourselves a little in the Adirondacks, a considerable wilderness up north here, you know—"

"Oh yes, I know—been there myself. Was there last summer."

"You! Is it possible, miss?"

"Oh yes; we had lively times there, I assure you. I am the correspondent of the *Lively Midge*—sporting paper, you know. By-the-way, have you read Murray's book? If you haven't been in before, it may serve you. Some folks think it a 'sell,' because it was published 1st of April, as you will see from the preface. But no matter. Murray is all right—personal friend of mine. You'll find copies for sale in the saloon below. Excuse me, gentlemen. I hope to meet you again. Ta-ta!"

"Phew!" said the doctor, as she vanished. "How her tongue rattles! There's a wood-nymph for you!"

"Or a katydid," suggested Topsy.

"Correct! Hit it about right that time, I guess, neighbor. That's her name—Kate—and no mistake. I know her. She writes for the papers—writes books."

This extraordinary information was volunteered by a consumptive-looking Yankee who had been eying the group for some time, trying to get a word in edgewise. He was one of those hatchet-faced fellows who seem to have just enough inquisitiveness left in them to keep soul and body together.

The Club appeared not to heed the intrusion.

"Be any of you going into the woods?" the stranger persisted.

"We be." (*Omnes.*)

"Is it healthy in there? Because, you see, I'm kinder ailing, and I don't keer to go in if it's agoing to hurt me. They say the mountain air is good for invalid folks, and I've been recommended to go in. I hain't been first-rate for more'n a year back."

The questioner, by some chance, directed his remarks at Nugget, who replied:

"Oh, if you mean to ask my professional advice, I should say, Go in, by all means. We sha'n't miss you. It may help me a little in a business way, too."

"How's that? Be you a doctor?"

"Oh no! Quite the reverse. I'm a sexton

—grave-digger. I'll see that you'll have a decent burial, my friend."

"Sure? You don't mean that, now? Well, I'll take the chances on it, any how. I'm determined to go in. I've been advised to. Come to think on't, can you tell me, mister, which might be the best route to go in—by the way of Port Kent, or the t'other route?"

"Really, my friend," replied the sexton, after proper reflection, "I don't think it makes much difference which way you go *in*—you'll probably come *out* at the little end of the horn!"

A laughing chorus followed this solo upon the "horn," in the midst of which the victim emitted a hacking cough and retired.

When the sober mood returned, "By Jove!" said Nugget, "this subject of a choice of routes had scarcely occurred to me. It seems the whole boat-load, invalids included, are bound for the woods. I don't understand it. Let us inquire."

The sexton's proposal met the common approval. The Club ascertained that opinion was about equally divided, as between the Port Kent or Keeseville route and the Plattsburg route. It transpired that there was a bitter rivalry between the Keesevillites and the Plattsburgers. The Keeseville route was the shortest in miles, and formerly took all the travel; but the whole journey was by stage. Latterly the Plattsburgers had built a railroad extending twenty miles into the wilderness; so that the longest way round was not only the shortest, but the easiest way in. It seriously lessened the pecuniary profits of the Keeseville stages and hotels. Hence those tears. Each route had its earnest advocates and detractors. "The dilemma," said Musquash, "was something like the old darkey's:

"'Supposin',' said the African exhorter, by way of illustration—"Sam! supposin' you kum to two forks in de woods, and de finger-board he say dis road lead to hell, and de oder finger-board he say dis road lead to heaben—which road you take, um?"

"'Why, de toder one, ob course.'"

"'Well, den, supposin' de debil kum along, and he put up anoder finger-board, and *both* boards say dis am de road to hell, which road you take den—tell me *dat*?'"

"'What?—um?—when both roads lead to hell? which road I take, eh? Why, den dis nigger *take to de woods*, ob course; what you s'pose, you ole fool?'"

Hour after hour had passed away in pleasant chat, bearing more or less upon the general topic. Meanwhile the steamer had threaded its sinuous course through the Whitehall Narrows, passed Ticonderoga, Crown Point, and other places famous in Revolutionary history, touching at numerous picturesque landings, and gradually unfolding to view the blue mountain ranges of Vermont and New York, with their lofty peaks dimly outlined in the distance. Late in the afternoon she blew her whistle and rounded gracefully up to the little wharf at Port

Kent, where she landed half of her passengers. As there were only half a dozen wagons visible to accommodate the multitude, the Club continued its voyage to Plattsburg. Its first care was to find a hotel. "Fouquet's" was near the landing. The Club reconnoitred. Having little baggage, it was foremost at the office, and asked for rooms. The polite clerk informed it that the house was tolerably full; but that, if it would sleep four double, and take turn about with a party who had already preempted the room, it might have No. 21. When the Club demurred, the clerk assured it that, since the rush for the

"Wilderness" commenced, such accommodations were considered first-class. It afterward found excellent entertainment at "Witherell's," further up town.

In the morning it took an early train and was whisked away twenty miles into the Wilderness. The crowd of the day before accompanied it, largely reinforced. Among the accessions was a fat lady, with her daughter and a poodle. The ladies were very much dressed—likewise the dog, which was wrapped in a Paisley shawl. All smelt strongly of musk and patchouly. They had evidently ventured to be foremost in patronizing a new and popular resort, in order to introduce the fashionable styles—just two days later from Saratoga.

"By Jove!" cried Musquash.

"Hallo! what's the matter?"

"Don't you see? Ha—ha! there's our fat friend going in!"

"So she is! and her daughter too. I wonder what she's going to do with that dog? Madam, I beg pardon—is this a deer-hound?"

This from Topsy, of course.

"What! poor Flora? La, no! Now, Sir, don't you know, I think you are trying to tease me! Here, Clementina dear, take the little darling, while I go and arrange with the coachman. La, sakes! I shall go distracted. Only to think that Pa would permit us to travel thus without attendants! Can you tell me, kind Sir—I presume, by your *toat ensawmb*, that you are familiar with the vicinage—can you tell me when the *diligence* leaves for Apollo Smith, Esquire's?"

"MADAM, I BEG PARDON—IS THIS A DEER-HOUND?"

Topsy didn't know one place from another. The Club had not even made up its collective mind which route to take.

"Well, really, madam, I—I—"

"Better git aboard, marm, if you're going in. The stages will be all filled up," interrupted a driver.

"Mercy! how rude these people are! Which is your carriage?"

All this little divertisement took place at the dépôt. A daily line of "stages" was advertised to leave the railroad terminus at Ausable station, upon the arrival of trains, for Paul Smith's, Baker's, Martin's, Bartlett's, and all the various forest resorts. There were a dozen nondescript vehicles drawn up at the platform—covered rockaways, market wagons, buggies, and "buck boards"—nothing that resembled a "stage" of the primitive period. In the midst of the general rush and confusion, the Club was glad to secure a double-seated wagon, which answered its purpose tolerably. The driver booked them for Smith's, and they now waited only for Topsy, who was watching the fat lady.

"Mercy!" said she, "I never can endure to go in one of those outlandish vehicles. What *outré* affairs! Have you no *voiture*, no *barouche*?"

"Eh? No what?"

"Nothing better than these?"

"No, marm."

"Well, I shall die! I never can survive. Why, Clementina love, don't you know we traveled all over the Alps in our own private carriage—to Vevay, to Freiburg, to Martigny—

"HAVE YOU NO VOITURE, NO BAROUCHE?"

and so luxurious, one could fancy one's self in a cradle; and you know, dear, we are always accustomed to our own carriage!"

"Yes, indeed, Ma," the daughter replied. "Poor Flora, too! She never *can* ride without C springs. How absurd of Pa to let us come!"

"I'll tell you what, marm," said the good-natured bushman, who was anxious to please, and not behind in native politeness; "if you will ride on with me three miles to the Forks, I can get you a private carriage, but it will cost you more money."

"How much?"

"Have you many trunks, marm?"

"Only these seven. You can take them in with us, can't you?"

"Phew! seven Saratogas! Not by a darn sight, marm. We'll have to haul them in with a team. It will cost you double fare, marm."

"Oh, lor! double fare! Well, *n'importe*, never mind. You can charge the bill to Mr. Apollo Smith. He knows me well. He is to pay my expenses until my husband, the General, arrives. Oh, dear! what an uncivilized country we have come to, to be sure!"

All being now ready, the several stages rumbled off to their respective destinations.

"You wish to go to Paul Smeet?" said Jehu to the Club. "Very well, I take you to Smeet." And away they rolled over a plank road so rough as to rattle the gold filling out of their teeth—down a hill so steep that blankets, bags, fishing-rods, passengers, and seats were well

shaken into a heap over the forward axle—around a turn so short that it upset the equipoise of the old sexton, and whisked the gravel over the edge of a twenty-foot sand-bank—and then over a beautiful stretch of level road, willow-fringed, that skirted the bank of the rushing Ausable.

Uncle Silas, the driver, was a French Canadian, who had migrated to the Adirondacks thirty years before. He was one of the early pioneers, and knew every rock in the country, and didn't mind running over them occasionally. The Club discovered that fact.

The country through which they had passed thus far was simply undulating. It was pretty well settled and cultivated. Two or three considerable towns boasted their brick buildings. Ranges of frame dwellings followed the course of the river as they advanced. The doctor wished to stop and fish, and was much disgusted to hear Uncle Silas say there were no trout in the stream—the mills had driven them out.

"It's always so!" he growled. "I never went fishing yet, but when I got to the place the sport was just twenty miles beyond."

At Ausable Forks the Club was astonished to find a populous town with a telegraph office, brick stores, and the like—streets busy with passing wagons, and mills resonant with their industrious hum. At Black Brook also there was a large settlement—the centre of the great Rogers iron district, whose railroad, plank road, stores, mills, bustle, and thrift have all grown out of the business prosecuted by the enter-

prising proprietors. Here every thing was black and dusty. Smelting furnaces emitted dense volumes of smoke. Huge charcoal vans and loads of iron ore constantly passed. The road for miles was lined with the huts and cabins of the employés, populous with smutty-faced children. Away off on the bare hills thin columns of smoke told where the miners were delving into the bowels of the earth. Slag and iron filings paved the thoroughfares. Coal dust filled every chink and crevice. It settled thickly upon the trees, and when it rained the leaves shed rivulets of ink.

At Black Brook the road passed through a ravine, and then ascended a tiresome hill. Here the character of the scenery was totally changed. Gradually and imperceptibly, by railroad and stage, they had climbed a thousand feet above the level of Lake Champlain; and now, at the summit, an amphitheatre of Titanic proportions loomed up on all sides. The blue ranges of hills swelled into mountains of every conceivable size and outline, which swept away in double and triple phalanx to the farthest limit of vision. Clouds capped the tops of the most aspiring. A wilderness of forest climbed their inaccessible sides. Here and there only, at inappreciable intervals, a clearing might be descried. Along the highway which they traveled were the only traces of habitations. The scenery was so grand and the occasion so exhilarating that the sexton declared he began to feel his digestion improve already. He felt as hungry as a bear. Opportunately they arrived at Franklin Falls. Here they found dinner and the noble Saranac.

"Saranac! there is romance in that name. It is redolent of pine and balsam, trout and aboriginal Indian. It is the heaven that leavens the great lump of the Adirondack range. What splendid pools of inky blackness! what dashing rapids! what chasms boiling with frantic waters! what a peaceful overarching of green alders! What a place for trout!"

Musquash stood upon the brink of the deep ravine, and thus gave vent to his pent-up eloquence.

"Pshaw! mister; you can't catch no trout here, excepting in the spring. Don't you see, the mill drives 'em away." A small urchin spoke, whom Musquash had not observed before.

"What mill, youngster?"

"There, Sir; just over there. Don't you see that air saw-mill?"

"Saw-mill! yes, by Jove, I see it now. D—n saw-mills! I detest that word 'mill,' whether as applied to labor or the prize-ring. It is forever marring and destroying the face of nature. I wish all mills were put into their own hoppers and ground up!"

A shout from the rear warned the indignant sportsman that the stage was ready to proceed. Before they departed they were requested to sign their names on the hotel register. All made their marks. Topsy had undertaken to count those that preceded. There were up-

ward of *one thousand* names, counting arrivals in and out.

"Phew!" said the doctor; "if men were cattle I should say that there had been a *Mur-rain* in the States, and that every body had stampeded for the Wilderness. Well, we'll go on and stay our forty days out, any way. Somebody will provide manna for the multitude, I hope."

In the lapse of time the party reached Bloomingdale, the last post-town on the route. Their course had been ever onward and upward, "like the eagle, my boy," and the journey had already become tedious. They had accomplished thirty miles of staging, and they had eleven yet to go. On their way they had stopped at a country store for beer. They had seen but few houses, and the farms were pinched and poor. The land was "strong," and the crops of boulders heavy. There was about one blade of grain to an acre of stone. Hills and swamps had been shorn by frequent fires, and fences were in danger of the oven. There was quite a congregation of loungers of sundry ages around the store, and to judge by the weak and worn condition of the fences and porch, the loungers had to depend upon them for support.

The Club engaged one of the veterans in conversation.

"How do you make a living in this barren country? You don't depend upon the travel, I suppose?"

"Barren country! Why, bless you, there is no finer farming land in the State. All that is needed here is a little *energy*, *enterprise*, and *capital*. By-and-by immigration will begin to strike in, we hope, and then we shall get on well enough."

The Club concluded not to wait for the immigration, and pushed on. From Bloomingdale until within two miles of Paul Smith's the farms were much improved, and the houses nearly all frame. Then they struck into what bore some resemblance to a wild country. The forest was dense, there were deer tracks across the beds of the brooks, blue jays and squirrels screamed and chattered in the woods, and an eagle sailed leisurely across the blue rift above their heads. It was eventide, and the wayfarers watched eagerly through the openings for the first glimmer of the sunset sheen upon the bosom of St. Regis. Presently the glorious, inspiring bay of hounds fell musically and mellow upon the ear, the sound of a chopper was heard near at hand, small dogs barked a falsetto accompaniment, old wagons, wood-piles, and other evidences of civilization hove in sight, and in a few moments a turn in the road brought the hotel and the lake simultaneously into view. A minute more and the Club was shaking the kinks out of its legs on the long piazza at Paul Smith's.

A numerous and motley crowd gathered around to greet or survey the new-comers. Tipstaff inquired for the landlord.

Paul said, "Here!"

He reported an abundance to eat, but no beds. Was the piazza pre-empted? "Yes—every individual plank." No room on the lawn? "That was occupied, too, by dwellers in tents." The boat-house, bowling-alley, barn, out-buildings? "All were full." Hat-racks and clothes-hooks in use? "Yes." Tipstaff inquired for Spalding's glue. The landlord had some. How could he accommodate the guests? He would do every thing in his power. He had already succeeded in making the house hold twice its capacity. "Then," said Tipstaff, "you will have not the slightest difficulty in sticking us up against the wall for the night. Consider these clapboards engaged by the Club."

A volley of cheers followed this sally, and the Club became favorites at once. Several ladies offered their extra trunks for lodging. It was astonishing what multitudes of trunks there were—likewise guns, rifles, fishing-rods, creels, landing-nets, knapsacks, rubber over-coats, oil-cloth suits, casts of flies, patent mosquito nets, water-proof boots, self-acting pocket pistols, meerschaums, and the like—standing in corners, hung on pegs on the door-posts and walls, and lying around loose generally. Strings of sick fish were laid out on the porch for the inspection of dogs and guests. Wooden models of big trout that had been caught in days by-gone were stuck up conspicuously, with the date of the achievement and the name of the great achiever. The guests, too, were a motley crowd. It being after the regular supper hour, they swarmed upon the piazza and lawn, and the Club had full opportunity to survey the wondrous scene. There were dames in longitudinal trails, who promenaded luxuriantly; maidens in full-fledged paniers; snobs with canes and eye-glasses, strutting in intensest agony of self-conceit; professional sportsmen in fishing suits of approved material and cut; excursion parties in bush-worn habiliments, just returned from far-off woods and lakes; invalids in flannel wraps and big easy-chairs; old gents in Panamas and homespun, who read the latest papers; young gents who played euchre and sipped their claret per last arrival; nurses with fat babies; small, ubiquitous boys in short frocks, who rubbed molasses taffy on every body's clothes; and petite little misses in starch and furbelows, who minced, and smirked, and carried on imitation flirtations with children of larger growth. Then there were games of croquet upon the lawn, boating parties upon the lake, lovers sauntering in the woods, and a Chickering thrumming in the parlor. Down at the boat-house a party of incipient but now self-approved anglers, who had passed their first fortnight in camp, were discussing theoretical points with the guides, and a couple of bad boys were trying to set the hounds to fighting on the lawn.

This was the "St. James of the Wilderness." It was astonishing how three hundred guests could put up so cheerfully and harmoniously

with accommodations designed for only seventy-five! It was a "happy family."

There was much more to be seen and taken in at a glance, but attention was diverted by new arrivals, accompanied by a familiar voice in a high key.

"Abuse my Flora, indeed! you nasty man! Here, Flora—poor thing—come here! Did he hurt my little darling, so he did! I'll complain to Mr. Smith. Just to think! how dare you take my Flora by the nape of the neck and chuck her out of the carriage! Dear sakes! I shall faint! Where is a seat? Clementina, my vinaigrette!"

No seat being convenient, and Mr. Smith at the moment appearing:

"Oh, Mr. Smith! how glad I am to see you! Are our apartments ready? You know I engaged apartments. And, Mr. Smith, I told the driver to charge the carriage hire to you. It is all right, driver; you may go now. Dear sakes! how shall we ever endure such a fearful journey the second time!"

"Here, Ma—this way. Here is a person to show us our rooms," said Clementina.

The excitement was more than the Club could stand on an empty stomach, and it accordingly went to supper. Later in the evening, when the crowd had somewhat thinned, the Club was invited to a game of euchre. It played with varying fortune, but it was generally remarked that the sexton won when *spades* were trumps. The Club was also fortunate in having canvas accommodations tendered them in one of the tents upon the lawn. It gladly accepted; but when the morning dawned it discovered that it had jumped from the frying-pan of indoor discomforts into—rather an extensive puddle. It had rained hard during the night, and the party got well soaked. For the first time in his life the doctor was tempted to go back upon his practice—hydropathy.

Just before the dinner hour the high key of the familiar voice was heard in the hall.

"Really, Mr. Smith, we can not possibly stay. It is out of the question. I never, in all my life, occupied a room before without carpets. It is decidedly vulgar. Why, we have Axminster at Saratoga always—don't we, Clementina? Summer weather! It makes no difference, Mr. Smith. Other people may put up with it if they like, but not I—not by no manner of means. Besides, Mr. Smith, you have no French cook; I can't do without a French cook. The table is not nice either, and the chamber-maids wait in the dining-room. Bah! it is too much!"

"Oh yes, Ma dear—let us leave this horrid, outlandish place; do, Ma!" pleaded Clementina.

"What time did you say the next conveyance would go, Mr. Smith?" the lady asked.

"This afternoon."

"Then, please consider our seats engaged. We shall undoubtedly intercept our baggage."

Let me see, Mr. Smith, can you accommodate me with *a hundred dollars?* The General provided us with very little money, as he expects to find us here when he comes. Oh, la! won't he be surprised!"

The result of the negotiation was that the Club became the fortunate possessors of an excellent room, with comfortable beds, good attendance, and the cleanest of linen. The table was bountifully provided, not only with the toothsome products of forest and stream, but with those little luxuries and delicacies which one expects to find in all hotels termed first-class. Considering its isolation from all markets, great credit reflected upon the caterer.

The day following the Club tried its luck in the adjacent ponds and streams. At daybreak the doctor was observed by Topsy (who had one eye partly open) to rise noiselessly and slip stealthily out of the room. He had heard that early morning was most favorable to successful angling, also that the monster lake trout of the Wilderness kept near the bottom at this season. So he took a copy of Agassiz, a hand-line, and some bait; and, jumping into a boat, pulled out to the middle of the lake, where he came to anchor. Then he threw overboard a handful of pork scraps, by way of "chumming" the fish. After this he paid out ten or fifteen fathoms of line, and adjusting his cushion and his spectacles, opened his favorite author. He had just reached that section which treats of the action and effect of phosphorus as a stimulant to the brain (illustrated by numerous eminent examples), when the gong sounded for breakfast. At the same time he felt a dull tug at his line. Hastily dropping the book, he hauled in, hand over hand, with such celerity that, before he was aware of it, the above represented nondescript creature stared him full in the face! The doctor had never caught a "laker," but it needed no great intuitive perception to determine that this was clearly a fish of another color. The general aspect of a lake trout is white. This was decidedly black—as black as the devil. It had horns too, and looked something like the devil, only that it had a benign cast of countenance, and wore two white pendants under its throat, like the ends of a clergyman's neck-choker. Tipstaff said it looked like George Francis Train in disguise.

After breakfast the Club tried its hand at fly-fishing. Each boat carried two persons besides the boatman. Tipstaff and the doctor were in the same boat. Tipstaff eagerly jointed his rod, and, at the first cast, threw two joints into the water. When he had adjusted the parts, he let out more line, and, drawing his rod well back for a long throw, succeeded

"THE LAKER."

in fastening his hook into the doctor's hat. Then he reeled up, and at the next cast snapped off his tail fly, with a crack like a whip's. This quite discouraged him. Dropping his rod, he let the flies sink to the bottom, when, lo! an unmistakable bite! The line ran out handsomely. In his excitement and surprise, Tipstaff struck with all his might; for an instant a small sunfish dangled in mid-air, and when he dropped, with a delicate little splash, back into the water, Tipstaff discovered that his second joint had broken short off at the ferrule! So he resignedly put by the fragments, and lighted his pipe for a smoke.

Meanwhile the boatman had paddled off some little distance, and the doctor, casting his flies by some chance near a cluster of lily-pads, saw a sudden gleam of light just where they dropped. In an instant a half-pound trout tautened the line, and darted, full tilt, for the pads. The doctor held on to his rod with a will, but did not prevent the fish from entangling himself in the long, tough stems. Fortunately, both the line and the trout's jaw were strong. The boatman paddled to the spot, and pulling up the lily-pad, drew it, the trout, and the line together, safely, but tangled, into the bottom of the boat. But disaster attended their triumph. While they were engaged in securing the fish, the rod fouled, bent double, and snapped in the middle!

The doctor looked at the wreck with tears in his eyes, and then said, resignedly, as he held the butt in his hand, "This is the end of my split bamboo!"

The rest of the Club met with little better success. They destroyed a fabulous amount of tackle, and caught five small trout; and "what were they," as Tipstaff said, "among so many?" Wherever they went they found no lack of company. A dozen boats were always on the ground before them. Nothing could have mitigated their disgust and disappointment except the good dinner which they found provided when they returned. There is nothing like a good dinner to soften the asperities of misfortune, especially when it is sauced with Champagne, and a saddle of venison and baked trout with cream are the *pieces de resistance*.

Now Musquash was missed immediately aft-

er dinner; and it was simply because the foregoing is a truism that the Club did not order the lake to be dragged at once, and the woods to be searched, for his dead body. Musquash *could not have committed suicide upon a full stomach*. Every one granted that. It was equally improbable that an accident had befallen him, for he was known to be habitually cautious; besides, being a lawyer, he could argue himself out of a scrape at once. Had there been an evening paper printed at St. Regis Lake, that day's issue would have contained the news, in big type, "Mysterious Disappearance of Musquash, the Counselor;" and his friends would have advertised for him. As it was, the mystery continued unsolved throughout the day.

Now the fact was that the smell of venison at table had started him off, like a sleuth-hound, on the trail of blood. Avowedly, he was on the alert for derelict sportsmen; but this time he did not appear (or disappear) in the rôle of a detective. He took a gun with him, a guide, and dogs, and followed a by-path through the forest to Osgood's Pond. What he did, or what he attempted, no deponent has ever been found to testify. If, indeed, "there be tongues in trees," the trees have never whispered. One belated sportsman averred that he saw a light dodging about the swamps late at night, but he could not determine whether it was a "Jack" or a Will-o'-the-wisp. "Only this, and nothing more." A single remark which Musquash himself let drop, when he appeared at the table, alive and well, in the morning, was all that seemed to afford any clew to his manœuvres. The purport of it was this: "I haven't seen the sign of a trout or a deer being caught any where about here since I've been in the woods, and yet the table is abundantly provided with trout and venison at every meal." Then he seemed wrapped in thought for a moment. His brow knit, and his fingers clutched spasmodically; then he added, with his mouth full of delicious deer-meat, "If I only could find who it is that is breaking the game laws every day, shooting deer out of season, I'd prosecute 'em, con-found 'em!"

Human nature will out, and Musquash was but human. The dog in the manger showed more human nature than is generally credited to canines. There are men termed sportsmen who will wantonly slaughter game in season and out of season. It is to protect the game from these ravagers that judicious laws are

enacted. The true sportsman needs no legislative restraint. He is the real conservator of the laws. Thus, the Adirondack hunter, who is in a great measure dependent upon the forest for his subsistence, thinks it a hardship that he is made to suffer for the sins of reckless deer-slayers; and while he does not hesitate himself to shoot deer out of season to supply his *necessities*, it is seldom that he can be found the ready abettor of pseudo-sportsmen. He will, indeed, accompany them on hunting excursions, and, to all appearances, assist them in their endeavors; but if the sportsman be a novice or unskillful, it is seldom that he will have the satisfaction of filling his bag. There are a thousand little tricks of the craft which the guide will employ to save the life of the deer, while apparently acting in good faith toward his employer. If this is news to any frequenter of the Adirondacks, let him put it in his pipe and smoke it in lieu of killikinnick.

That evening the members of the Club sauntered down to the guide house, where they encountered a delegation of those forest rangers. Said rangers had understood that the gentlemen were going "in," and wanted guides. Said rangers were hirsute, swarthy, raw-boned, iron-ribbed, and looked as though they might exist in regions where none but creatures with gum-elastic souls could counterfeit even a respecta-

THE LAZY GUIDE.

ble appearance of life. There were guides of all sizes, ages, nations, and degrees: lazy guides, witty guides, talkative guides, low-bred guides, bragging guides, silent guides, bad guides, good guides, independent guides, hotel guides, sober guides, thirsty guides, gray-haired guides, carrotty-haired guides, bald-headed guides, cross-grained guides, guides well recommended and guides without a character—Frenchmen, Yankees, Irish, and Indians. All offered their services, and were ready to go any where, any how, and at any time; they were ready to tramp it, to pack it, to boat it, to rough it, to take it easy, and to take it "straight;" they knew all the best camping, hunting, and fishing grounds, and had been there before; they knew their way into any part of the Wilderness, and they knew their way back. The Club was just on the point of making its selection, when it was startled by the unmistakable voice of its worthy president upon the landing below. The guides recognized it too.

"Hallo! the professor is back," they said.

"If there isn't old Fudge, you may shoot me!" cried Topsy.

There was a rush for the landing. The Club fell into the arms of Fudge. Fudge fell into the arms of the Club. It was an affecting meeting. The Club was surprised to see the professor then and there. Was he just going in? Would he accompany it on its excursion to the Raquette? No! the professor had just returned from a grand tour of the lakes. He had been out four weeks.

"I had expected you in sooner," he said, "and should have been pleased to join you at that time. The fact is, my friends, the best of the season is over. Trolling for lake trout is done with. The speckled trout don't rise much to the fly. You are now betwixt hay and grass, so to speak. In two or three weeks more the trout will gather around the spring holes and mouths of cold brooks. Then they will take the fly freely, and you will enjoy good sport. You may also take some lake trout, still-baiting, with ten-fathom lines; but, for my part, I had as lief drag the East River for dead bodies as to haul fish in by main strength in that fashion. My time for trouting is always in the spring, not later than June. The trout are in best condition then, and fair game. This fishing in spring holes is small business, in my opinion."

"But, professor, this is the very time of the year that Murray's book recommends sportsmen to come, and he cracks up spring-hole fishing, too."

"Perhaps he is a spring-hole fisherman. For my part, I regard it as a kind of slaughter—a sort of ichthyicide in the third degree. The fish really don't have a fair chance. Nature teaches them to swarm in those localities most suitable for spawning beds. You know they are there, and you have only to go and take them. They come to your hand just as a dog is tempted by the love of a bone. In the spring they are

scattered about all over the lakes and streams, and it is then that your knowledge of the habits of the fish—your science as an angler—avails you. To take the beauties then is the essence of sport."

"Shall we get no fishing, then?"

"Oh yes, my friends, lots of fishing. As a rule, the more *fishing* the less fish."

"About the flies, professor—are they very bad?"

"Never saw them worse in my life than they are at this minute. But this is an exceptional season. They hang on late. One thing you may depend upon—you never can enjoy the perfection of fly-fishing unless you endure the torment of black flies; that is, indeed, excepting you go in the early spring, and then the weather is too cold for comfort."

"So you really decide not to accompany us?"

"My friends," said the professor, "if you always carry a baby it will never learn to walk. It is best that you should go alone. Practice and experience are the best teachers. Besides, I have told you already that you are too late for me. However, I will furnish you an excellent substitute. Here is old Uncle Steve. He is the Nestor of all the guides. You can depend implicitly upon him."

Late the following morning the Club bade adieu to old Fudge, and started on its tour of the lakes. Uncle Steve prepared the outfit, which was light, since it was decided not to camp out much on account of the flies. (The distances can be so arranged that one can find comfortable lodgings in a sporting-house, provided they are not overcrowded.) The fleet comprised three boats—one large one carrying Uncle Steve, the doctor, and Tipstaff, and two lighter ones for Nugget and Musquash, with their guides. The Adirondack boats are seldom adapted for more than two persons, as they require to be built as light as possible that the guides may back them the easier over the "carries."

By common consent Topsy was made quartermaster of the expedition. "A quartermaster," says Topsy, "is a *ration*-al being who keeps a quarter for himself and gives the balance to the rank and file." He took it in charge to carry the liquor for the whole company, "so as to keep the party together, lest they should become separated and get lost." It was pleasant to watch the departure of the little flotilla, with its chief officer at the helm of the flag-ship arrayed in the full "pomp and penelope" of his official station. Gayly they traversed the expanse of the lake, and then disappeared around a turn of the outlet. A tortuous but romantic passage led them into a second lake, and anon into a third, studded with islands and flanked by blue mountains. Here was a wilderness in all its primitive grandeur and solitude. Broods of young ducks started up betimes from the sheltering alders that fringed the shores. Kingfishers rattled out their screams of defiance from the stark branches of dead pines. Loons

BEFORE GOING TO THE ADIRONDAKS.

pipied in the distance. Occasionally the tawny outline of a deer could be detected on the shadowy shores. The Club could not repress its delight with the constantly shifting panorama.

In due time Uncle Steve headed the fleet for the land, and ran up on the beach. A hirsute and shaggy being emerged from the bush, and approached. He moved his hands and arms wildly, as if making signs. The Club showed symptoms of alarm, and seemed inclined to fall back upon its quartermaster to keep up its spirits. It took the strange being for some Robinson Crusoe, or wild man of the woods. Its courage partially returned, however, when it discovered that he was only brushing away flies and mosquitoes; and when Uncle Steve introduced him as old Moses San Germong, it was fully reassured. At first the old fellow didn't seem to recognize any of the Club, but when Topsy drew the cork of his whisky-flask, he showed signs of intelligence. The Club learned that St. Germain—which was his real name—was to haul its boats over the "carry." He was to be its Moses to guide it through the Wilderness. He was the Charon to ferry it over the *Sticks* on dry land. The distance was a mile and a half, and the way was rough—now rising a steep knoll, anon dropping into a gully, leading through

bogs and quagmires, and across rotten sticks and decayed logs, obstructed by underbrush and overarched by sombre pines. Such are "carries" generally. The sled could haul only one boat at once, and consequently, by the time all were over, and launched upon "Big Clear Pond" (the next lake), the Club was quite ready to proceed. The flies had drunken and made merry at the expense of their best blood. Their patent mosquito nets proved worse than useless, and were voted a humbug. The Club looked, collectively, as though it had the measles. At the outlet of Big Clear the route for two miles lay through a flooded tract that bristled with more stumps than a cricket ground, with a channel so narrow and tortuous that, when they rounded a short turn, one might jump from the bow of the boat into the stern. Then they crossed a short "carry," amidst clouds of mosquitoes and flies, and descended a miserable, narrow stream, called "Ramshorn Creek," a ram's horn so crooked that, if the Israelites had had the like at Jericho, they would have needed to go round the city but *once* to make it tumble from sheer vertigo. Thence they passed into the broad and beautiful waters of the Upper Saranac—immortalized by artists and poets—and thence to Bartlett's, a good hotel, where they rested for the night. The next day's journey comprised a three-mile "carry" through a venerable maple forest, and a dashing race down the darksome channel of the river Raquette. It was a refreshing journey, free from all molestation of mosquitoes, protected from the summer sun by an overarching canopy of maples and evergreens, and redolent with the sweet odors of balsams and pines. No traces of man's presence or handiwork were visible here, save when a sporting party hove in sight. Vegetation grew rank and tangled. Savages and wild beasts might have lurked in the thickets secure from closest observation. Once Uncle Steve paused, and pointed to a prone hemlock that protruded from an alder copse, like a gun from a masked battery, and extended its gaunt length one-third across the stream, casting a black shadow into the depth. "There, do you see that log? I was passing just here two years ago last fall, and happened to look at that log. It looked kinder queer, like as if it was covered with brown moss. But it warn't moss, by a darn sight! You can bet I scooted away from that log as fast as I could, and drifted down stream. Just there was an old *he panther*, ten foot long, lying flat on his belly, waiting to drop on the backs of the deer that come down the run to the bank of the river! I hadn't no gun, nor didn't need any (though I'd have liked to kill the critter), for the minute the varmint found I seed him, he slinked back down the log, and giving a jump clean over them alder-bushes, dove out of sight into the woods."

The narrative shortened the breath of the interested listeners, who were sensibly relieved to learn that such highwaymen of the woods were

seldom seen nowadays. The next noteworthy incident occurred while the party halted for lunch at the mouth of a cold brook. A boat came jauntily down the stream. There was nothing remarkable about the boat itself; but it was loaded deeply with two large chests and several bales of canvas, probably tents, besides a miscellaneous collection of cooking utensils, guns, and rods. In the stern was a figure, upright, with skull-cap, eye-glass, mutton-chop whiskers, snuff-colored sporting suit, and kids. The figure moved neither to right nor left, but drew a basilisk focus full on the Club with its eye-glass, and eyed it intently as it passed. The Club saluted with the greetings customary under the circumstances, but it spoke never a word. Only when it apparently became satisfied that the Club didn't owe it any thing, and was otherwise beneath its notice, did it avert its supercilious gaze. This figure was an English tourist "doing" the Adirondacks! Such curiosities are occasionally, though seldom, seen, as Uncle Steve said of the panther. This cavalier treatment hurt the Club's feelings so that it couldn't eat!

After this they pulled down the river to Setting-Pole Rapids—a romantic stretch of foaming water—where they caught some fine trout with bait. Then they retraced their steps as far as Big Tupper Lake, which they had passed on their way down. There are several houses near the outlet of Big Tupper, two or three of which are kept as hotels for sportsmen. These happening to be filled, the Club had to camp out for the night. It was its first experience, and it was naturally a little nervous. The first alarm was shortly after dark. Topsy had some fine old Scotch ale put up in stone bottles. The bottles were in a rubber bag, and the bag was in the stern of the boat. Uncle Steve volunteered to go for the beer, and straightway disappeared in the darkness. While he was gone, the Club became absorbed in a game of euchre. The sexton had won two games, and was in the act of turning trumps, when a series of loud reports, close at hand, startled the party to their feet. Groans followed.

"Injuns!" shouted the doctor, and seized his gun.

All seized weapons and rushed in the direction of the sound. Presently they came upon the prostrate body of Uncle Steve. Close at hand lay the bag, boiling over with froth. The sexton hastily took position be-

AFTER GOING TO THE ADIRONDACKS.

side the beer, ready to extend his professional services.

"Help!" cried Uncle Steve.

"What's the matter?"

"Darned if I know!" murmured the sufferer, faintly, as he recovered his pins. An examination solved the mystery. All the bottles had burst with one grand simultaneous explosion! The weather being warm, and the road somewhat rough, the beer had *worked*. The bag was air-tight and slung over Steve's back; hence the concussion was tremendous, and followed by a violent fit of nervous prostration. The loss of the ale, under the circumstances, was irremediable; it was disheartening. Whisky was the only substitute the commissariat afforded—the only consolation at hand to revive their downcast spirits. So they kindled the camp-fire into a ruddy blaze, heated water, and made hot slings, with which they comforted the inner man. Their pipes were produced and lighted, and while they drank inspiration from the weed and grain, Topsy sang this pæan in praise of Bacchus, the mellow deity:

"Talk not to me of temperance joys,
Nor of teetotal vows—
I drink a drink that's fit for gods,
Which common-sense allows.

AN ENGLISH TOURIST "DOING" THE ADIRONDACKS.

And he who would not drink with me
Is sure a senseless noddy;
For oh! true rapture's only found
In drinking Whisky Toddy.

"It oils the hinges of the tongue;
To fancy gives the rein;
From it the noblest thoughts have sprung;
It soothes the lover's pain;
It throws a glow o'er every sense;
It cheers and warms the body;
He's wrapping flannel round his heart
Who drinks of Whisky Toddy!"

By this time the bibulous bard had become so exhilarated by the combined influence of the whisky and the "divine afflatus" that he was ready to head a scouting expedition to the neighboring houses and camps. He failed, however, to muster any recruits. The Club declined peremptorily, and so he departed *solus*. Toward midnight the Club, whose senses were keenly on the *qui vive*, was aroused from its fitful slumbers by strange noises in the adjacent underbrush. They were something unearthly—a combination of groans, coughs, yelps, and sneezes, followed by hissing sounds like steam escaping. The doctor, who had been reading "Murray," bethought him of the ghost of "Phantom Falls." The sexton, speaking from experience, maintained that ghosts were noiseless. Musquash suggested owls. "Is it," said he,

"'The moody owl that shrieks?
Or is it that sound betwixt laughter and scream,
The voice of the demon that haunts the stream?'"

"It may be panthers," hinted the sexton.
"Let us awaken the guides."

"No, not yet," said Musquash. "Let us see what we can do first ourselves. 'Murray' says, you know, that 'a stick, piece of bark, or tin plate shied in the direction of the noise, will scatter them like cats.' I'll show you the passage in the morning. Now let's have at them, boys!"

This advice was immediately followed. A volley of old boots, tin plates, empty bottles, and chunks of wood went crashing into the brush. A moment of silence followed, and then the sounds were repeated again. The commotion had now aroused the guides, who seized some pieces of blazing bark and boldly advanced. The object of their consternation and search was soon discovered. It was only poor Topsy, their comrade, all unconscious, and wrapped in sonorous slumbers!

... Just here the record of the Club becomes somewhat misty; nor does it appear to have been subsequently kept with that nice regard for dates and coherent narrative that characterized it at first. It is made up mainly of personal incidents and comments of little interest to any but the Club. It seems that it followed the route usually taken by the most enthusiastic of tourists, visiting all the large lakes and streams on its way to Raquette. It ascended exceeding high mountains and surveyed the illimitable panorama of sky-splitting peaks and deeply embosomed lakes. It penetrated forbidden fastnesses and stirred up the old hermits that had hoped to find eternal seclusion from the eyes of men. It left newspapers at Stony Brook stuck up in a crotch near

the spring where old Calkins came down to drink, that he might know the war was over and Grant elected President. It visited Grave's Lodge on Big Tupper Lake, where it found all the little nick-nacks of civilization. It caught big trout at the foot of Bog River Falls, fighting flies meanwhile, whose voracity and persistency not all the smudges and tar-and-oil preventives could diminish or disperse. It examined the traces of the old military bridge of Revolutionary days, which was thrown across the Raquette near the head of Long Lake—Long Lake, magnificent in its broad expanse of water and the ever-changing outline of its shores. It visited the picturesque camps of ardent sportsmen, whose snowy canvas tents at times relieved the solitude of the wilderness retreats. It partook of the famous pancakes which Mother Johnson prepares at Raquette Falls for the delectation of her guests, and took "plane board" in the carpenter shop of Uncle Palmer. Not a single place recommended by "Murray" or suggested by its attentive guides was omitted.

At Raquette Lake the Club found numerous camps. One, more pretentious than the rest, attracted its attention. It was built of boards, and thatched with split shingles. It wore an air of domestic comfort not usually found in bachelor quarters. Besides, there were certain nondescript garments of flimsy texture hung on the neighboring bushes, that betokened the indubitable presence of females. Bouquets and wreaths of flowers adorned the gables of the shanty. When the Club ap-

proached it was met by a jolly, sun-burnt sportsman, whose weight might have been one hundred and fifty pounds avoirdupois. The stranger started in perceptible surprise.

"Well, now, I swear to thunder," said he, "if this ain't cute! Who'd 'a expected to have seen you here? Don't you know me? Why, I'm the thin, consumptive cuss that you said was going to come out of the little eend of the horn! 'Twould take a pretty good sized horn now, I guess. But come in. Here's our old friend, the katydid."

There, indeed, stood the fair little correspondent of the *Lively Midge*, with her dear little arms up to the elbows in flour.

"You are just the person I wish to see," she said to Tipstaff, when she had saluted the rest of the party. "All of our company have gone off after berries for my pies; and just as soon as I have mixed this dough I shall want you to go with me to gather pond-lilies—for we are to have a little spree to-night. Now you will, won't you? That's a good ducky!"

Tipsy was embarrassed. He had seen very little female company for the last three weeks, and the sensation was altogether novel. However, he held himself in readiness; and presently a lithe little figure, in short frock and Bloomer trowsers, with a soft felt hat thrust jauntily over her tresses, and a tin cup strapped around her waist, tripped down to the cockleshell of a boat that waited for them.

"Now, Mr. Tipstaff, I want you to pull me right across to yonder little cove that you see by that big rock. We ought to go over in two

AN EXPLOSION.

minutes." And the sylph seated herself gracefully in the stern, without any undue flourish of petticoats or tiresome adjusting of folds.

Tipsy blushed crimson. He was ashamed to confess that he didn't know how to row.

"Oh, never mind! Take my seat, and I'll pull you over. You shall be the rudder, and I'll be the compass. Won't that be jolly? Now steer, and keep your eye steadily on me."

What a fix for a sensitive young bachelor! Tipsy never knew exactly how he got over the lake, nor how they ever managed to find such a boat-load of pond-lilies. It must have taken a long time to gather them.

The record abruptly ends here. The siren enticed the original memorialist away into some forest recess, and it is quite possible that he is hopelessly lost. No mention is subsequently made of him. There is, however, a supplementary chapter in a different handwriting. It purports to give the proceedings of the last meeting of the Raquette Club, and is dated at Raquette Lake, August 1.

The sexton offered a resolution to dissolve the Club then and there—that it adjourn *sine die*, and bequeath all its accoutrements and paraphernalia to old Fudge, its founder.

"I find," he said, "that I have no taste for these things. For my part, I had rather offi-

ciate at one first-class funeral than catch all the trout in the Adirondacks. One can occupy his time to advantage in my business. If he can't do better, he can learn the dead languages, and study Latin off of old tombstones."

The doctor remarked that camp life was like every thing else. It was no doubt very well for those who liked it and understood it. "But," said he, "it don't seem to agree with me. I don't see that eating fish, and making perpetual Lent and Friday of one's existence, is a-going to help one's brains. Besides, here I've broken fifty dollars' worth of rods and tackle, caught no trout, swallowed a peck of dirt and ashes in this savage mode of cooking and eating, and been devoured by flies and all manner of insects. Look at my ears *now*; if they swell much larger I shall begin to think I made an ass of myself by coming into the woods at all!"

Musquash remarked: "I've followed 'Murray' implicitly, and here's the result. You know what the Scripture saith—'If the blind lead the blind, both shall fall into the ditch together.' And HERE WE ARE! I move we adjourn. I want to go home!"

Carried unanimously.

The historian has now got to the end of his tale. What will he do with it?

"WHAT WILL HE DO WITH IT?"

SOUTH-COAST SAUNTERINGS IN ENGLAND.

[Saunter *VI.*]

CANTERBURY CATHEDRAL.

CANTERBURY.—I.

BEFORE making a modern pilgrimage to Canterbury, the pilgrim will do well to visit the old Tabard inn, two minutes' walk from the Southwark end of London Bridge, where Chaucer and his jolly comrades gathered for a similar expedition five hundred years ago. But he who has read that gem of American humor, Hawthorne's "Celestial Railway," will be impressed by the fact that Mr. Smooth-it-away and his fellow-directors, who bridged the Slough of Despond, and tunneled the Hill Difficulty, have been hard at work in providing swift trains to take one in an hour or two along the road over which the Canterbury pilgrims once jogged on their two days' journey. Just across the river he will see the grand arch of the Cannon Street Station, he will pass by that of London Bridge, and under one of the viaducts that bear the trains over the house-tops, and, when he turns in from High Street to see the ancient Tabard, he will find nearly all of it transformed into a railway office. The old inn is still, however, partly an inn. The tap-room is in an an-

cient house connected with it; and the Tabard proper is divided up into dismal chambers containing beds, which are let out to drovers and marketers at one shilling per night. A great fire which occurred in the neighborhood in 1676, only stayed by blowing up six hundred houses, destroyed, some say, the inn of Chaucer's time; other authorities maintain that it kindly spared this one hostelry, so that we have it about as it was in Chaucer's time. I can not decide; the antiquity of the present building is certainly very great. The large tap-room in which the pilgrims, if the last-named opinion be true, enjoyed their "'alf-and-'alf" of ale and piety, is now divided by a partition, making two bedrooms, in which the hard-worked rustics sleep, no doubt without many dreams of the queer old stories haunting every niche around them. The ancient host, the immortal "Harry Bailly," is at present succeeded by an affable young man, William Stevens by name, who is very proud of the antiquity of his place, and has even, I believe, ventured to disturb the minds of his present customers by restoring the name "Tabard," in place of "Talbot," the name by which it has been known these two centuries. The original Tabard signified the stately, sleeveless coat of that name worn by noblemen in early days, afterward by heralds as a kind of livery, and which has now disap-

[NOTE.—The writer of "South-Coast Saunterings in England" regrets that he has been misled, by a very circumstantial account with which he met, into stating, in a former article, that Mr. Carlyle is in receipt of a pension from the English government. Such, he is now assured, is not the case.]

peared. Talbot is a dog. Until about twenty years ago there was an old sign on the house inscribed, "This is the Inne where Sir Jeffry Chaucer and the nine-and-twenty pilgrims lay in their journey to Canterbury, anno 1383." There is still over it all that remains of a large sign-board which once bore a painting of the pilgrims setting out on their journey, the work of Blake. There is an old etching on copper of this painting, which I have seen. It is full of spirit and character. On the board strong imaginations still trace out some of the figures. I could only see the head of a horse, a big tankard tilted up to a mouth, and the head and part of the *décolleté* bust of the Wife of Bath, who, after her five husbands, was evidently regarded by Blake as ready to take the sixth.

In the tap-room, where I stopped a while, there was a collection of eight or ten men and one woman, all of the rough and poor kind, who were engaged in eating their mid-day cheese and drinking beer. The woman had a bruised eye, probably received from the low-browed fellow by whose side she sat silently as he devoured some sausages. The interest of the company seemed more or less absorbed in a hot disputation going on between a low, thick-set, gray-haired fellow in his shirt-sleeves and a vehement, black-bearded working-man, on the existence of a God. "Men may go on, and go on," exclaimed the latter, "saying what they please 'bout blievin' this an' blievin' thet; but wat's the fust thing a man says wen 'e gets flat 'n 'is back 'ith illness 'n pain? Wat's 'e call out then?" "Lord 'eve mussy upon me!" chimed in a sympathizer. "You may well say thet," continued the speaker, pointing the statement by cramming his mouth full of a dark-looking substance which he seemed to enjoy. "But," returned the atheist, seizing on one of the few opportunities allowed him by the occasional spiking of his antagonist's mouth with food—"but wut I'd like to know is why, ef ther's a God, why does he let a feller fall flat of 'is back 'ith all sorts of pains?" "Thet's wut none ov us knows nothin' 't all about. But wen a man is taken down a-groanin' 'e's sure to call on God to help him." "Yes, an' he may call an' call," sneered the old infidel, walking over to the fire, and squaring his back to it; "but 'is rheumatiz will go on fur all that, least the doctor kin cure 'im." "Hi don't blieve," retorted the other, "as 'ow Godamity sends all the hevil things a-goin' on in this 'ere hearth. Hi don't blieve 'e sends a man 'ere to commit murder an' get 'anged furt." "Must be a bad lot ef 'e does!" called out a youth from the further end of the room. "And yet," rejoined the remorseless skeptic, "doesn't the Bible say God hardened Pharaoh's heart?" The theist was somewhat staggered by this, having, I inferred, originally taken his stand on the Bible. He fought shy of the question raised, and returned to his allegation that all men called on God when they were in trouble. I left him fighting it out on that line, and went to explore

the old inn, thinking what the ghosts of the old pilgrims, who journeyed to have their aches healed at the shrine of St. Thomas of Canterbury, must, if they haunt the Tabard, think of the discussions which have taken the place of their pious tales. Yet I could not help thinking that there was a logical thread running through the centuries, and connecting those who went in those days

"The holy blissful martyr for to seek

That them hath holpen when that they were sick,"

and that terribly large number of the poor in England who refuse to believe in a God who, after the petitions of centuries, still leaves them in their wretchedness. They who dogmatized about that whereof they knew nothing, and persuaded—as some would now persuade—suffering men and women that the course of Nature is arbitrary, and may be altered by human genuflexions and prostrations, planted those seeds of atheism, whose dreary fruits can wither and fall only under the purer faith which is dependent on no private interests, which does not look upon the Infinite through the pin-hole of self, but cries—as no doubt many a poor sufferer in these hovels does, voicelessly—"Though He freeze, though He starve me, yet will I trust in Him!"

Though living in an age when the purer spirit of Christianity was hopelessly imprisoned in the ritual, with which it had become invested—when priests carefully selected the ore instead of its metal for the building of their shrines—it is wonderful how far old Chaucer saw beyond these things. Even while he used the dross for the frame of his picture, the picture itself has many tints of the reformed faith which was to appear six generations later. The old Oxonian heretic, and author of the "Book of Martyrs," John Fox, wrote a remarkable passage about this.

"I marvel," he says, "to consider this, how that the bishops, condemning and abolishing all manner of English books and treatises which might bring the people to any light of knowledge, did yet authorize the works of Chaucer to remain still, and to be occupied, who, no doubt, saw in religion as much almost as we do now, and uttereth in his works no less, and seemeth to be a right Wicklavian, or else there was never any; and that all his works almost, if they be thoroughly advised, will testify (albeit it be done in mirth and covertly)."

He also knew of certain persons who, "by reading Chaucer's works, were brought to the true knowledge of religion." A spiritual descendant of this sixteenth-century worthy, who bore his name, the late W. J. Fox, wrote a beautiful paraphrase of Chaucer's last composition, written on his death-bed, "when he was in great anguish," which was set to music by Miss Flower, and is now a favorite hymn in several London chapels. I yield to the temptation to quote it here, as it will probably be new to nearly all my readers:

"Britain's first poet,
Famous old Chaucer,
Swan-like, in dying,
Sung his last song,
When, at his heart-strings,
Death's hand was strong:

"From false crowds fleeing,
Dwell with soothfastness;
Prize more than treasure
Hearts true and brave.
Truth to thine own heart
Thy soul shall save.

"Trust not to fortune;
Be not o'ermeddling;
Thankful receive, then,
Good that God gave.
Truth to thine own heart
Thy soul shall save.

"Earth is a desert;
Thou art a pilgrim;
Led by thy spirit,
Truth from God crave.
Truth to thine own heart
Thy soul shall save.'

"Dead through long ages,
Famous old Chaucer;
Still the monition
Sounds from his grave—
'Truth to thine own heart
Thy soul shall save.'"

One of the bravest and most eloquent of American preachers—Octavius Frothingham—once uttered a great discourse on "The Creeds of the Poets." He might have called it the Creed of the Poets, for, in all time, they have but one creed substantially. When Wordsworth heard Coleridge accused of atheism he remarked that he had always found Coleridge's atheism very much like his (Wordsworth's) Christianity. The poets stand on the peaks of Humanity's mountain range, and the same light it is that shines from summit to summit—though purple on one, golden or silvern on another—the same light, causing them to stand in the perspective of generations as the many-hued columns sustaining the dome of azure beneath which true spirits ever kneel and aspire.

About the close of the seventeenth century—and that is not a very long time in the life of a people—all this region called The Borough was the thick of London. Instead of the dozen or more splendid bridges which now span the Thames, there was then but the one crazy old London Bridge, which connected Southwark with "the city." In this direction the crowded population was dammed up, and, beyond, the roads passed through swamps infested with wild beasts and wilder highwaymen. Now the same roads pass among pleasant homes and villas; and the swarming Borough is to a sad extent populated with men and women who seem to have inherited the instincts of both beast and highwayman. One must not walk here with a watch-chain dangling at his waistcoat, nor stray too far off the high street. The district is, in fact, to a great extent, ruled by a gang of thieves, who have their own laws, and the police have to compromise with them. These thieves are gregarious—indeed are communists. They will pay the highest rents so

as to keep together. Every crime has about twenty of them, more or less, concerned in it. They do not care much for prisons, but detest the Refuge; chiefly, as one of them frankly said of late, because at the Refuge "one can't get pipes and beer; they asks you questions about yourself, over and over again; they makes you say your prayers; and they makes you wash." Fortunately for the wayfarer, they don't approve of crimes of violence, and one who can't commit a burglary without stunning a housekeeper is regarded as a bungler. Murder is tabooed, because it produces a long inquiry, and gets them in the hands of lawyers and newspapers. After all, they are great cowards. One of them once paid my house a visit. Nothing could exceed the skill with which he climbed over the porch to the second-floor, opened the window, opened every drawer and closet, and collected all the valuables to take away; but the step of a servant-girl on the stairway caused him to depart in a twinkling the way he came, without taking a thing with him. The heroine of the Borough gang is a woman called "Cast-iron Poll," who is better known to the public than the Queen. She has been committed to prison fifty-three times. Sometimes she gets tired of the monotony of her den, and, resolving to go to prison, visits a policeman, and asks to be locked up. The policeman declines, on the ground that there is no charge. "No charge? I'll soon make one!" she replies; and woe be to the unhappy wight she first meets. She is sure to attack him with tooth and nail, or to pilfer the first thing she sees, and proceeds to pass her month of laziness in prison. The police are in absolute terror when the day of her release arrives. It is sure to be celebrated as thieves alone know how to celebrate such events. On the whole, the forms in which the old heroic days of Robin Hood survive are not romantic, but they are very real.

The London, Chatham, and Dover Railroad keeps pretty closely to the old road by which the pilgrims of old journeyed to Canterbury. But one who in this busy world has the time, would find it a pleasant pedestrian tour to start from the Tabard, and, following the old Kent road, make the journey in three days. The old road was once lined with way-side crosses and columned Madonnas, which have now made way for the park gates and ivied mansions which represent the latter-day faith of England. As I once turned aside from the old road as it passes Blackheath, to enter the embowered home of John Stuart Mill, it seemed very likely that the most modern thinker of England was probably pursuing his studies on a spot which might have once held its way-side altar; but it could never have been more consecrated than this beautiful home now is to the young and earnest minds of England. In his company I passed a beautiful day, wandering farther on the same road past Chiselhurst Common, as far as St. Mary's Cray—which, I take it, was originally St. Mary's Grace—a spot,

probably, where the Virgin's favor was especially besought by pilgrims. If Chaucer's last words—"Truth thee shall deliver 'tis no drede"—be true, there never was one concerning whose destiny there need be so little "dread" as that of this man, than whom the air is not more transparent nor the flower he bends lovingly over more genuine. Not the devoutest pilgrim that ever passed Blackheath Park but might have found a true brother in this man, whom Westminster removed from Parliament for heresy. Never have I known one whose lightest word or look more betokened truth, nor a more profoundly and tenderly reverent mind. That which really enabled Mr. Smith's money to buy up Westminster was the ten pounds given by Mr. Mill to enable Bradlaugh, "the atheist," to carry on his canvass for the representation of Northampton. Bradlaugh is indeed an atheist; but Mr. Mill knows, as well as do others, that there are many such in England, and he does not think that it will do him, or his comrades, or any body else, any good that their religious opinions should shut them out from representation.

The loss of Mr. Mill from the Commons was keenly felt by many of the members, chiefly on account of the personal relations which had been disturbed. It was only the knowledge that he would not accept a seat so obtained which, to my knowledge, prevented one member from resigning in order that a vacancy might be made for his return. While he was in Parliament, Mr. Mill gave his services to the public work with absolute fidelity. Although residing nearly fifteen miles from Westminster Hall—his house being also a mile from the railway station—no weather prevented his constant attendance; and even when the debates were duller, and their subject comparatively unimportant, he would remain in his seat until late in the night, when he could only reach home in the small hours by a special conveyance. In the dining-room adjoining the House he would generally be found at six o'clock, surrounded by his particular friends, John Bright, Peter Taylor, and others, and was the life of the table. His wit on such occasions has a freedom and play which the severe nature of his works would not lead one to expect; and it would be hard to find a more genial companion. His *bon-mots*, whispered below the gangway during the debates, which were sure to go the rounds, are still remembered; as when he suggested that the member withdrawn by the redistribution of seats from *Honiton* ought in justice to be given to *St. Bees*. He entered the House with the reputation of a theorist; he has left behind him the reputation of being one of the most practical men that body ever had. Though it is certain that no loss has been more mourned by the members themselves, Mr. Mill by no means feels it in the same way. On the contrary, I found him almost jubilant at his return to his old pursuits; and he said that the recovery of the disposal of his own time was an

incalculable relief to him. In the long walk which it was my privilege to have with him, to which I have already referred, his conversation seemed to me wonderful for the range of knowledge and sympathy which it implied. Whether it was philology or the Church, physical science or the American war, he seemed equally wise and unerring in his information and instinct. He was particularly elated at the triumph of the anti-slavery cause in America. It is a grand proof, he thought, of the power of a just cause to uplift and inspire those who adhere to it, that the movement against slavery, beginning with a few ordinary men, whom it made eloquent and strong, at length gathered to it men of learning and genius.

I was very much interested to observe in Mr. Mill the tendency to follow things to their roots, archæologically, as well as philosophically. Thus he traced much of the conservative habit of mind in France and England to the ancestor-worship of the East.

The worship of ancestors preserves its greatest strength in China, and there conservatism attains its maximum. To copy the beliefs, the habits of one's grandfather is natural to one who believes his grandfather is jealously watching him near by, and, what is more, that the old gentleman, as dogmatic as ever, is in a position to punish and reward. But few recognize how powerful the same sentiment still is in Europe. During his residence at Avignon he had been amazed to see how completely even elderly people are often tyrannized over by their aged parents. The majority of French people, even after they have families of their own, never think of doing any thing opposed by their parents. The French law gives the parent power to control his sons or daughters in many most important matters—marriage, for instance—long after majority. In England ancestor-worship is mitigated, but not dead. In many families political and religious opinions are as hereditary as their estates. And in our endowed schools and institutions the present generation is directed and educated by men who, should they return from the grave, would not recognize the country, except for the anachronisms preserved about their own bequests.

In speaking of M. Comte, of whom he was one of the earliest students in England, and to support whom he contributed, with Mr. Grote and others, Mr. Mill expressed a deep sense of the importance of that philosopher's contributions to modern thought, and at the same time radical disagreement with many of his views. He valued highly his generalization concerning the three stages of thought through which phenomena—Theological, Metaphysical, and Scientific—passed, but could not agree with the classification of sciences into higher and lower. No man could say that any kind of knowledge is relatively lower than another, or what mighty results may spring from the seemingly insignificant discovery. The pebble which a geologist may hunt for week after week, the petty insect,

may be the needed link in the chain of knowledge, and may revolutionize thought. So that Browning's friend who

"wears out his eyes,
Slighting the stupid joys of sense,
In patient hope that, ten years hence,
'Somewhat completer,' he may say,
'My list of coleoptera,'"

may really prove a greater help to mankind than the most eminent sociologist. With regard to M. Comte's religious views, Mr. Mill partially anticipated Professor Huxley's description of them, as "Catholicism *minus* Christianity," by remarking that the form which his (M. Comte's) religious ideas had taken show how powerful the influence of Catholicism still is over the most advanced French thought. M. Comte knew nothing of the various forms of Protestant organization, else what bears so striking a resemblance to the Catholic organization might have resembled the Presbyterian or some other less rigid and centralized system. The most radical defect, however, which he found in M. Comte's philosophy was, if I remember, his conventional view of the right position and education of woman. It was plain to me that Mr. Mill's hope for the future of society is primarily connected with his expectation of a fuller infusion of the feminine nature into it; and that he thinks there is a growing perception that our unmitigatedly male civilization is becoming dreary and fruitless. It has done its stem-work, but the tree now requires something finer than tough fibre. Soldiering is no longer the chief end of man. We are all thinking of some new departure for society, and what is left to be tried but the educated woman power?

But I must not forget that my Mecca is not Blackheath Park just now, but Canterbury. Yet we must in each age be allowed our own Meccas. Are there not a little off the high-road to Canterbury the Druidical remains near Rochester, and "Kit's Coty House"—a grand solitary cromlech almost as mysterious as the sphinx—where pilgrims made their way a thousand years before Canterbury ever heard a Christian chant? Our age worships thought, and finds its healing shrines at Concord, Faringford, Chelsea, Blackheath Park, and the like. Nay, the brightest light about Canterbury at this day is that which it has borrowed from its poet-pilgrim; and when Dean Stanley was transferred from the old see to Westminster Abbey, he placed a memorial stained window in the latter which had nothing to do with the saints, but is called "The Chaucer Window." And a noble monument it is too, if the reader will allow me to make one pause more, before proceeding on our pilgrimage to Canterbury, to say a word concerning this last ornament of the old Abbey. The window is placed immediately over the tomb where Chaucer's dust reposes. It was designed by Waller, and executed by Baillie and Mayer, last year, in London, and shows that work of that kind can be as well done here as

on the Continent. At the base are pictures of the pilgrims setting out from London, and their arrival at Canterbury. Above are two medallions, representing Chaucer receiving his commission in 1372, from Edward III., to the Doge of Genoa, and his reception by the latter. At the apex is represented, allegorically, as two ladies, one in white the other in green, "The Floure and the Leafe." "As they which honour the Flower, a thing fading with every blast, are such as look for beauty and worldly pleasure; but they that honour the Leaf, which abideth with the root, notwithstanding the winter storms, are they which follow virtue and during qualities, without regard to worldly respects." In the spandrels and traceries are heraldries, and portraits of Edward III., and Philippa, Gower, and John of Gaunt, Wycliffe and Strode—Chaucer's contemporaries. They are fringed with the arms of England, France, Hainault, Lancaster, Castile, and Leon. At the bottom is written "Geoffrey Chaucer, died A.D. 1400," and beneath all four lines from the "Balaide of gode Counsaile:"

"Flee fro the press, and dwell with soth fastnesse,
Suffise unto thy gode though it be small;"

* * * * *

"That thee is sent receyve in buxomnesse;
The wrastling for this world asketh a fall."

There is a still, religious light about the window, which may well denote the quiet beauty with which the sacred stream of thought flows ever through the ages, shining above the mouldering monuments of kings, luminous after their strifes and ambitions are forgotten. Little did King Edward III. dream that in the end he might be chiefly remembered as the monarch who recognized Chaucer!

As we stand beneath the poetic arches which vault above the tombs of the poets of whose dust Westminster Abbey is the shrine, they must stiffen a little, and the tombs must wax fewer and blacker, ere the view dissolves into Canterbury Cathedral. Arriving in that ancient city—it is only a town, but a cathedral makes a "city" in England—we would like to put up at the old inn where Chaucer's pilgrims stopped; but alas it was burned a few years ago, and only a bit of the wall has been preserved in the smart new dry-goods shop which is its phenix. So we stop at the Fountain Inn, which has long been a favorite hostelry. There is a tradition that there was once a fountain somewhere about it; of course it dried up when the Catholic archbishop left. Hastening to see the Cathedral one will pause before an old gate, once splendid, now decaying, from which the statues have fallen away (even the English climate is hostile to images). The most discoverable thing on the gate is a big papal tiara, now split in two. Passing beneath the arch, a sudden splendor breaks upon the eye. It were, indeed, hard to find the match of Canterbury Cathedral, as to its exterior, though its interior is somewhat cold. More especially is that grand central tower, which seemed to Erasmus a pil-

THE UNDERCROFT.

lar of cloud, guiding pilgrims for many miles around, impressive. A tower of defense for one age, it stood as a tower of vision in another; but it is now only a huge monument of dead conflicts and faded visions, for, on trying to get to the top of it, I was told that the steps had long been too rickety, and no one had gained any outlook from it these many years. I could not help remembering that its present dean has discovered that it is even harder to get any grand moral outlooks from cathedrals than physical ones from their towers.

I had arrived the day before the great event, the coronation of a new archbishop. It had been for some time understood that the occasion was to be accompanied with greater solemnity and effect than had been witnessed there for some centuries. The pressure for tickets had been so great that Dean Alford was reported to have telegraphed for lodgings in Bedlam. There is no doubt that, though a kindlier man never lived, he made several thousand enemies by his inability to enlarge the capacity of the Cathedral. On this previous day all was astir. Little processions of clergymen in shining black cloth and snowy cravats were continually passing and repassing; and the various endowed schools were being drilled for the part they were to take in the great procession next day. In one quarter were heard the sharp reproofs of the master—"I must insist, etc. Some of you show an utter contempt, etc. I must have no mistakes TO-MORROW!" In the choir the leader was drilling the little choristers in the most thorough way. "You must sing it more *crisp*—

'Provèd thee — and — saw — thy works.' Then again, in 'To whom I swear in my wrath' — there positively *must* be more emphasis on *sware*." It was really very remarkable to listen to these little fellows—the oldest of them could not have been more than twelve—as they sang with accuracy and feeling the grand music of Handel, and even the subtle and complex compositions of Spohr. Whether there be at Canterbury the counterpart of the Sacred Rod preserved at Rome, which Pope Gregory used to apply to his choristers, I know not; but they are severely drilled.

The inside of the Cathedral is in the shape of a large cof-

fin. About half the interior is new. The finest fresco decorations in it were painted by a woman, a Mrs. Austin, who worked on it while her son, the present architect, was putting up some of the stained windows. Some of the slender pillars which were renewed a few years ago were stained over with a dark oil, so as to make them look like the old pillars. This oil was also put on the ancient pillars to preserve uniformity; but the effect has been to polish the old and blacken the new, so that now the real look sham, and the sham real. The tombs in the new part are generally execrable mementoes of obscure personages. A fair sample of them is that of one Jacob Hales, once English Ambassador to Portugal, who died at sea, and was thrown over in his armor, as he requested. The tomb has a portrait of Hales, a painted picture of his being let down over the side of the ship, and another painting of his residence and estate in the neighborhood of Canterbury!

Wishing to begin at the root of that which, leaf after leaf—under seasons which were centuries—unfolded to the oldest and most historical architectural flower of Christian England, I went into the crypt or undercroft, and there passed the morning. A few steps taken, an old wooden door opened; and I passed from the realm of Dr. Tait and the nineteenth, to that of Ernulf and the eleventh century. This crypt, meant to imitate the catacombs of Rome, is one of the five eastern crypts in England founded before A.D. 1085—the others being Winchester, Gloucester, Rochester, and Worcester. In

these old crypts one may spell out letter after letter not only of the periods when they were built, but of pre-historic ages. Left alone for hours in this cold and dismal cavern, it gradually became haunted as with rank after rank of ancient gods and saints, who seemed to pass forever by. Of that procession I was to see the latest detachment accompanying the new archbishop next day.

I can not help forgiving some of the timidity and servility which enter so largely into what we call conservatism, for the sake of the important service it has done in preserving the traces of the continuity of human development. Canterbury can be traced back for nearly a thousand years before the birth of Christ. It was the *Durwhern*, or "place of the swift stream," which *Ludhudibras* founded, the *Durovernum* of the Romans, the *Cantwara-byrg* (borough of Kent) of the Saxons. During that time it has passed from religion to religion; its cathedral, after it got one, has been burned, wasted, renovated, again and again; yet each generation that superseded an older altar borrowed something from it, until, when Christianity came, it found rudely traced records of every deity which had been ever worshiped there. At this point, indeed, it was not due chiefly to conservatism that the footprints of pagan deities managed to get upon the temple of the new faith. That they are represented here at all—albeit in hideous forms—is due rather to controversial exigencies. The earliest Christian missionaries, preaching that the British deities were devils, brought Southern art to their aid in representing them as such. Odin, Thor, Baldur, and the rest were nowise inferior to the gods of Greece in the dignity and beauty ascribed to them; but the plan of the Christian in superseding them was to carve and paint them in horrible caricature on some inferior part of a church, so that they might suffer by contrast with the beautiful forms and faces of the Christ, Madonna, and saints, to whom they wished to allure the populace. But, having once got their foothold thus on Christian architecture, it was due to religious conservatism that the traces of them were preserved. Each new architect, each renovator, jealously copied what he found on the original walls. No matter how ugly or grotesque, if a figure was on the first little church, it must be copied, perhaps with some emendations, on every stone petal as it unfolded to the cathedral. And thus it is that I am able here to decipher, in their degraded forms, the once noble divinities of these islands, each bearing, no doubt—though not easily discoverable—some trace of what it was genuinely associated with in the minds of its sincere worshipers. They are carved on the capitals of the low columns, which are about six feet in height. One is a winged ram fiddling, which Max Müller would no doubt trace back to Aries in the zodiac, and Lyra among the constellations. A goat—the animal which drew the car of Thor—and a wolf are playing on a trombone; they are

Odinistic, and their musical instruments come all the way from the pipe of Pan. A goat rides on a cock, which had so long given its entrails for the inspection of soothsayers that not even its Christian service in awakening St. Peter to repentance could save it from disgrace as a pagan bird. A nondescript winged animal, which might be a malformed sphinx, plays on a harp. A man with ass's ears has his hands gnawed by two wolfish animals—an admonition, no doubt, of how Odin's two pet wolves would serve those who venerated their master. Two frightful predatory birds, which might be caricatures of the same deity's owls or ravens, are also found, with a leopard beneath them. A hideous man, with long serpent tail, holds up a bag in one hand and a bowl in the other. A huge sphinx-like monster, winged, with wide, brutal mouth, head humanized, but with sinuous, or almost serpentine horns, holds a fish in human hands. Another head, with some qualities of humanity, has ass's ears, tongue lolling out, and tusks which branch out into foliations. A similar architectural conceit is shown in a lion whose tail branches to a stem bearing two *fleurs-de-lis*; and in a picture of a man struggling with some beast, both man and beast having tails which harmoniously blend to make the scrolls of the capital. There are no figures of serpents, which confirms Mr. Ferguson's opinion that serpent-worship never existed in any of the British Islands, except, perhaps, Scotland; but the dragon (winged) appears several times. One curious sculpture represents a warrior mounted on a queer feathered horse—as near as I could make the beast out by light of a torch, which dispelled the darkness imperfectly—with a still more nondescript animal beneath, kissing, or else biting, the warrior's toe. It suggested at least a rude version of St. George and the Dragon.

This work in the undercroft, though the most ancient, has outlived several architectural stratifications of a more recent date. In 1571 Elizabeth gave up the crypt to French refugees from Alva, who here wove silk and had their own pastor. It is marked all over with texts in French, left by those "gentle and profitable strangers." Recent repairs have brought down heaps of the old ornaments of the Cathedral, making a strange *débris* strewn along one side of the crypt. I hardly knew whether to moralize or laugh while fumbling among this saintly rubbish. Some saints or kings had contributed only their two feet, broken short off at the ankle; a crook, with a hand holding it, was all that remained of what may have been the Pope himself. From beneath the round stomach which was all that remained of a friar, who possibly paid too much attention to it while living, peered the two stony eyes of a nun, or fair-saint, as if their curiosity alone survived the wreck wrought by time. Scores of these fragments of the limbs and features of saintly parties lay in this strange medley; and, if they can now look down upon the fallen estate of

DEVICE ON ARCHBISHOP
MORTON'S TOMB.

bishop Morton's tomb and rebus—a *mort* (hawk) and a tun.

Few, however, obeyed the summons. There were at least thirty persons present belonging to the Cathedral, about one-half being choristers. Four clergymen participated in the readings and prayers. There was no sermon. Yet even the presence of strangers had not swelled the audience to the number of those officiating! Among these sat Dean Alford, with his clear, frank eye, taking in for the thousandth time that anomaly which he has so powerfully exposed, that the immense revenues of English cathedrals should be keeping about each of them a small regiment of clergymen and clerks, to read and intone before a dozen or two wealthy ladies! Dean Alford is a handsome man, with a tall and shapely figure, surmounted by a good head and face. His grayish hair and beard—he is nearly sixty—are the frame of a face full of genial humor, and with that freshness with which so many English students and literary men in England seem embalmed. Shakspeare could never use the expression, "Sicklied o'er with the pale cast of thought," were he living among the present fraternity of English thinkers. The Dean of Canterbury has such a modern look and such a youthful step, he so simply uses everyday words and tones, without cant, that one almost suspects him to have been accidentally entangled in his vestments as he came in at the door. His voice is particularly pleasant; and, being a Cambridge man, he is happily without that Oxonian drone, of which no graduate of the older university is free. The dean looks the poet far more than the ecclesiastic; and, seeing him, one thinks rather of his "School of the Heart, and Other Poems," or "The Poets of Greece," than of the sermons which he has issued since Palmerston, in 1857, transformed the eloquent preacher of Quebec Street Chapel into the Dean of Canterbury.

Rightly to see the Cathedral, one must have both the physical and the historical perspective; and to get these, the approach must not be from London, but from the Isle of Thanet, away by the sea, where Augustine first landed at the close of the sixth century. The first

preacher of Christianity in Britain was Alban, who came hither in the third century. He was an enthusiast who knew nothing about compromises. He said to the pagans: "All those whom you worship are not deities, but devils; and they who worship them will burn in everlasting fire." It is no marvel that a people who sometimes sacrificed their own children to their gods felt no hesitation in sacrificing Alban. So he perished, and became a saint. But Augustine had no disposition to be canonized by the like ugly process. When he first set foot on the Isle of Thanet—on St. Mildred's rock, where the miraculous impression of his footmark disappeared only at the Reformation—he met Ethelbert, who, though a Saxon pagan, had been conciliated to Christianity by his French queen, Bertha, "under an oak that grew in the middle of the island, which all the German pagans held in the highest veneration."

All Augustine's first meetings with the British were held under the same kind of holy tree. After the interview, in which Ethelbert declared that, though he would adhere to his religion, he would permit theirs, Augustine marched up to Canterbury, the Saxon capital, with his procession of priests and choristers, singing all the way a Gregorian chant. Ethelbert placed them in "Stable-gate," by an old heathen temple where his servants worshiped—the site in the present of St. Alfege's Church. After they had staid there for some time, he admitted them to hold their services in the temple, which, under the name it now bears—St. Martin's—became the first Christian church in the kingdom. The spirit of Bertha is in its name—that of the saint of Tours, of whom she would have heard most in France—and her reputed tomb is also in it, though the visitors to the coronation who asked to see it found it utilized as a stove! In this little church Ethelbert is said to have been baptized, and the reputed font—modern, but possibly a monumental imitation of the original—is shown. The present St. Martin's Church is very ancient, and, on a

DEAN ALFORD.

pagan foundation, contains some of the Roman bricks of Bertha's Chapel in its walls. When Ethelbert was baptized his people were also, and there were great rejoicings at Rome. Augustine was so delighted that the Pope had to admonish him to humility. And, sooth to say, it seems Alban was the better man. My objection to Augustine, as a man, is not—not mainly, that is—because when the people of Stroud humorously fastened a fish-tail to his back he cursed them so that the population were ever afterward born with fish tails, but, rather, that he instigated the massacre of an older remnant of British Christians in Wales, because they were not ready to worship the Pope. But as to his apostolic services in Britain there will be various opinions. While the Pope was congratulating himself at Rome that the Gospel was being embraced by the heathen in Britain, the fact was that Augustine was managing to give a Christian veneering to the pagan divinities, which his baptized converts continued to worship. The cross was indebted for whatever homage it received to the sacred tree near which it was always planted, and the abbey to the wishing-well, whose magic power it rather sanctified than destroyed. The songs and dances once performed in honor of Odin and Nornir continued as the adoration of Romish saints. This compliance with paganism, on the much-abused "all things to all men" principle of Paul, had long been the practice of the Church in Egypt, where Coptic saints and Egyptian gods are to this day mixed in strange confusion; and in Greece, where the Parthenon and Temple of Theseus preserve more of the old Greek religion than the antique marbles; but in Rome the practice had been less compromising—the consecration of the Pantheon to all saints being almost the only instance. The Protestant world has been scandalized at hearing of Jesuits costumed in the East as Buddhist priests; but they of England who worship in Walsingham Church, or St. Paul's, or York, or Canterbury cathedrals, or in Westminster Abbey itself, kneel in Christian temples that never could have been built but for the degree to which they originally enshrined the hallowed forms of heathen deities. As we stand on the hill where St. Martin's now stands, overlooking a landscape sacred with the landmarks of Christian history, we are but doing what the worshiper of Odin did before us. The old arch and wall which first strike the eye—now called St. Pancras's Abbey—were once the chief temple of the Saxon deities, embosomed in a grove of sacred oaks. Augustine dedicated it to the boy-martyr, St. Pancrasius. Three miles off one sees the holy spot still called Hermansale, which was once Hermansale, "the pillars of Herman," whose relation to German mythology Grimm has pointed out (*Deutsche Mythologie*, i. 9). And in the great Cathedral over there—the first-fruit of the union of Church and State in Britain—there is to be seen a point from which the shrine has been re-

moved, like other shrines; but, although there is evidence that it was far more resorted to than any other in the Cathedral, Drs. Stanley, Alford, Robertson, and others, have vainly tried to discover any Christian saint with whom it can be associated. To this I shall have to allude again by-and-by; at present it is sufficient to remark, that it is more than likely that, even after the building of the later Cathedral, the common people were still indulged with the worship in it of some being unknown to the Catholic calendar. So, also, the Saxon festivals were retained, and the names of the days of the week, each that of some British deity.

Archæology finds the pre-historic past surviving among us in many ways. First of all in our words (*e. g.*, the names of the days); next in our architecture (*e. g.*, the orientation of churches, insisted upon by Vitruvius, a relic of sun-worship); then in our customs. Our games, particularly those of chance, are traceable to ancient religions; and among many tribes of savages dice are still used for divination. Gipsies still put cards to their primitive use of fortune-telling. But perhaps the most curious instance of this kind of survival is modern Spiritualism. Dr. Bastian, of Berlin, has lately shown how the very forms and tricks of Spiritualism have been known in the most ancient times. "Planchette" has been for ages a familiar instrument among the Chinese for receiving communications from their ancestors, who are to Confucians almost the only gods. The tyings and untyings in cabinets were centuries ago familiar to the Tartars and Ojibbeways of America. A distinguished biologist of London recently designated Mr. Home as "a Tartar in evening dress." But I find him more related to the ancient Celt. Thus, among the ancient Celts, great spiritual elevation was held to be frequently attended with physical elevation, and Mr. Home's latest feat is soaring in the air. From the earliest worshipers of Britain the idea passed into the Christian Church. Thus we read that Richard, one of the early archbishops of Canterbury, was surprised by a monk when floating in the air. Indeed it were easy to match most of the phenomena of modern Spiritualism from the records of this one city. Once a friar, who neglected to take proper care of the tomb of Ethelbert, was visited by a spirit, clothed in light, who admonished him, and retired. As for the spirit-raps, they were well known in the time of the witches, since when they have been repeatedly imitated by prisoners, who have used them to communicate from cell to cell—one rap meaning A; two, B; and peculiar noises agreed upon as signs for "Yes" and "No." Undoubtedly many of the ancient observances have come down to us through the alliance of the Church with the religions it found already in occupation.

But, to return to Canterbury, whatever may be thought of the moral and religious results of this compliant plan of Gregory and Augustine, over which Dean Stanley has charitably thrown

ST. MARTIN'S CHURCH, AND VIEW.

the mantle of John Wesley's saying, that "the devil ought not to have the best tunes," there can be no question as to the vast historical importance of the events traceable on the landscape stretching out from the point of view we have taken. "Let any one," says Stanley, "sit on the hill of the little Church of St. Martin, and look on the view that is there spread before his eyes. Immediately below are the towers of the great Abbey of St. Augustine, where Christian learning and civilization first struck root in Britain; and within which now, after a lapse of many centuries, a new institution has arisen, intended to carry far and wide, to countries of which Gregory and Augustine never heard, the blessings which they gave to us. Carry your view on, and there rises, high above all, the magnificent pile of our Cathedral (equal in splendor and state to even the noblest temple or church that Augustine could have seen in Rome), rising on the very ground which derives its consecration from him. And still more than the grandeur of the outward buildings that rose from the little church of Augustine and the little palace of Ethelbert have been the institutions of all kinds, of which these were the earliest cradle. From Canterbury, the first English Christian city—from Kent, the first English Christian kingdom—has, by degrees, arisen the whole constitution of Church and State in England, which now binds together the whole British empire. And from the Christianity here established in England has flowed, by direct consequence, first, the Christianity of Germany; then, after a long interval, of North America; and lastly, we may trust, of all India and all Australasia. The view from St. Martin's is, indeed, one of the most inspiring that can be

found in the world; there is none to which I would more willingly take any one who doubted whether a small beginning could lead to a great and lasting good—none which carries us more vividly back into the past, or more hopefully forward to the future."

We have thus approached our Cathedral from the right historical and artistic direction; and, on entering it, our first interest will be to search out the sites of the old shrines. In these days, when fine churches are built merely for show, when so many spires rise simply to beat other spires in the skyward race, it is important that we should realize that this ambition was the least element which contributed to the ancient cathedrals. Their grandeur and beauty were but incidental to other purposes. The reader who accompanied me on a visit to Christchurch, in Hampshire, will remember that we found preserved in the stone carvings of its Norman part the tiles and lattice-work which bear us back to the days when the cathedral was but the more commodious common cottage, to which the peasants gathered from similar, but smaller cottages, in which they could not afford to keep private chapels and chaplains like the gentry in their castles. Beginning with that for a seed, we may trace the growth of a cathedral as we would that of a plant. Here, for example, Augustine receives from the Saxon king a piece of ground on which to build a Christian church. It must, in the first place, be large enough to hold all the people he wishes to convert. But, though larger than the surrounding houses and the pagan temple (a larger Saxon house simply), it must not be unlike them, for the people would be repelled by any unfamiliar structure. So Roman architecture can not yet be imported.

Yet it must be, on the other hand, somewhat more beautiful than the pagan temples, in order to attract—a strictly utilitarian purpose, observe. The higher tower will catch the eye of more people, and those further off, than those of the Saxon temples, and so it is built higher than the rest. Thus far we have simply a larger Saxon house. After considerable preaching, Christianity has made such headway that an image of Christ may be introduced; next the Madonna; and in succession the saints. As fast as the people will tolerate them they ascend to niches inside or outside, not at all for decorative, but for strictly religious purposes. Presently they will appear in stained windows, for the barbarians love color, and they will be made beautiful, in order to excite homage. Emboldened at last the new religion will venture to humiliate the too-pleasantly remembered deities opposed to it by carving grotesque representations of them. Thus we have the germ of the cathedral. It requires now only to expand. Two causes will bring this about. The increase of population and of worshipers will render it necessary to add wings and extend the length. But a still more potent influence to expand the Saxon house to a huge cathedral will be that, as it goes on from age to age, necessarily through periods of invasion and convulsion, the house will gradually gather about it important historical events. Startling events, martyrdoms, and the like, will happen; and these, in an age that knows neither printing nor history, will be traced upon the stones. Memorials will gather to it in the shape of tombs and shrines. So the building must have room, not only for the people, but for altars, tombs, and shrines. Nay, these shrines, being supposed to have miraculous virtues, will attract thousands of pilgrims from a distance. For a long time it will be crowded by these; but under many seasons the stone will crumble, or perhaps a fire will occur, and thus will be furnished the opportunities of repeated enlargement—the original form, however, being preserved, as the old names of business firms are preserved long after those who bore them are dead, since with the old sign goes “the good-will of the establishment.” Thus we find the theme of Emerson’s “Problem” ever confirmed—

“These temples grew as grows the grass.”

We have but to add dates and names to the above general statements to have before us the particular history of Canterbury Cathedral. On its site stood a British or Roman church, built by King Lucius. Augustine pulled this down, and built a more commodious temple. It was repaired and enlarged by Archbishop Odo (A.D. 942–959); sacked by the Danes, and its monks massacred (1011); burned in the times of the Conquest (1067); reconstructed by Lanfranc, first archbishop after the Conquest (1070–1089); greatly enlarged by Anselm (1093–1109); chancel and choir built by Prior Conrad and dedicated (1130); choir

burned* (1174); completed again (1184); new nave and transepts added (1410); central tower built† (1495); and from that time to this, frequent renewals and additions.

The reader must bear in mind the reason why the prelacy of England is represented by the see of little Canterbury, rather than that of London; there, through the influence of Bertha, Christianity was recognized by the Saxons, at a time when it could not have been preached in London. The same will explain why it became an object of pride to the Catholic world in the South. At that day the mania for relics, each of which was regarded as having potency, was raging every where, and the bodies and bones of saints began to gather toward Canterbury. The body of St. Blaize, purchased for a large sum at Rome, was enshrined in the Saxon church. Then there were the heads of Saints Swithun, Furseus, Orun, and Bartholomew. But ere long Canterbury had no reason to look abroad for holy bodies. Saints Alphege and Wilfrid, martyred by Danes and Northmen, fell at its doors; and finally within its hallowed walls Thomas à Becket was assassinated, thereby becoming the greatest saint after Peter himself.

The legend that, after the Romans and Huns had fought until all bit the dust, their spirits kept up a spectral war in the air over the battle-field, is a literal truth when told of the ecclesiastical conflicts raging in England. In a spectral way the conflicts which marked the reigns of the Henrys and of Queen Elizabeth are still going on. The fight which was recently in progress between the relative authority of the Crown and the Convocation, apropos of Colenso—and whether that heretic, with the Queen’s appointment as Bishop of Natal, is superior in authority to Dr. Macrorie, whom the Church has consecrated to grapple with him—was really the struggle between Henry II. and Thomas à Becket revisiting the glimpses of the nineteenth century. Becket has from the day he fell been the gauge, the counter, the barometer, of English Church history. With admirable art, Browning, in his last poem, describes the old Pope reflecting on how the poor body of one of his predecessors, who had given a certain decision, went through all the vicissitudes of the doctrine of papal infallibility. As one party prevails, the Pope’s body is buried in pomp; as the other, it is pitched into the river. So since his death Becket has been enshrined, his shrine has been devastated, he has been canonized, he has been royally excommunicated, as this or that party has come into

* “Whereat,” says Gervase, who witnessed the fire, “the people were astonished that the Almighty should suffer such things, and, maddened with excess of grief and perplexity, they tore their hair, and beat the walls and pavement of the church with their hands and heads, blaspheming the Lord, and His saints, the patrons of His Church.”

† “Tanta majestate sese erigit in cælum,” says Erasmus, “ut procul etiam intuentibus religionem incutiat.”

THE PENANCE OF HENRY II.

power. One who reads the Church papers of London will see that his bones are not even yet permitted to rest; for though the supremacy of the secular arm over the Church is English law, it is still furiously denounced by High-Churchmen as "the Erastian Heresy." But any one who is scandalized by the acrimony of the Colenso discussion has only to read the history of the battle for ecclesiastical supremacy as it occurred in the days when the real English throne was that old stone chair, on which the Archbishop of Canterbury is still enthroned, to know that the controversy is now but a ghost. In those days we find archbishops sitting in each others' laps, in their competition for the chief seat on state occasions, and even coming to fisticuffs. The archbishops of York and Canterbury, Richard and Roger, had, in 1176, a regular mill in Westminster Abbey. The test points between the King and Becket were the immunity of the clergy from secular jurisdiction, claimed by the latter, and the supremacy of the see of Canterbury over that of York. There are twenty-nine histories of the affair, and so I need not go into it. We all know that it ended in the King sending his knights to Canterbury, who, after an angry interview with the unyielding archbishop, slew him. The spot where he fell—as, after turning his back on the one staircase by which he might have escaped, he tried to reach his episcopal throne—has been made out certainly by Dean Stanley. It is marked

only by a square piece cut out of the pavement, probably as a relic. "Into thy hands, O Lord, I commend my spirit," was his dying sigh. The monks watched with his body during the night, fearing further indignities would be offered it. Beneath his splendid canonicals was found the monk's habit, and haircloth next his skin.

Swiftly did the resurrection of Becket as a saint follow his martyrdom. An aurora borealis shot athwart the sky the same night, convincing the people that the martyr's soul had ascended to heaven in a glory like that of Elijah. The monks who had watched through the night reported that the dead man's arm had been lifted in the gray of the morning and signed the sign of the cross. But such stories were not needed to kindle the superstitious enthusiasm of the people, who were already dipping their garments in the blood that lay fresh on the floor. The assassination sent a thrill of horror through Christendom unparalleled in history. Henry II. was pictured in churches suffering the torments of hell. The poor King's superstitious fears were awakened by the anathemas heaped upon him; and when

his armies in Scotland began to suffer defeat, his spirit gave way, and he resolved to appease the spirit of Becket. He came from Rouen to Southampton in midsummer, and straightway set out on his pilgrimage across the Surrey hills to Canterbury. Barefoot, clad only in a woollen shirt, he passed through the streets until he reached the Cathedral. Pausing only to kiss the stone stained by Becket's blood, he entered the crypt where the tomb was, and there knelt to receive three strokes with a rod from each of the eighty monks assembled. (The accompanying picture is from an old painting which hung in the cathedral until late in the last century.) Having bestowed forty marks yearly to keep lamps burning around the tomb, he fasted all night, and repaired to London, where he was laid up with a fever. Saturday after, his victory in Scotland occurred. Into his bedroom, the fever yet upon him, a messenger came with the tidings, and the King leaped up to offer thanks to the propitiated "St. Thomas."

Thenceforth he became more widely known than any other saint. There were churches dedicated to him in Rome, Lyons, even in Syria. His relics are still kept in the Basilica of St. Maria Maggiore, beside the cradle of the Holy Babe. A tooth is treasured at Verona, an arm at Florence, two arms at Lisbon—indeed, if all his arms shown on the Continent are genuine, he must have been Briareus. His skulls are hardly less numerous. Drops of his blood, pieces of his vestments, his cup, knife, and

boots, are scattered through England. It is not to be wondered at that Canterbury, so baptized with saintly blood, became the great centre of English Christianity, and that Becket's body was raised from the crypt where it had been at first laid to be removed to a shrine, whose splendor illuminated the body of the Cathedral and became the celebrity of the world. Four years after the martyrdom the choir was burned. This, probably, was the reason that the shrine was not made until 1220. Never was before any thing so magnificent as the "Festival of the Translation of St. Thomas." Pilgrims swarmed from all parts of the world. Proven-der for horses was provided gratis all the way from London to Canterbury, where wine also was freely provided for all. The greatest prelates and noblemen of the world, and even several foreign princes, were in the procession, which, headed by the boy king, Henry III., passed through the Cathedral, bearing the body to its shrine. Many of the wealthy had been proud to give precious stones and rings for the decoration of the shrine, which was one mass of splendor. Of these one was of especial splendor—the "Regale of France," the finest diamond or carbuncle in the world—"big as a hen's egg"—worn by Louis VII. of France, who, having hesitated to give so costly an offering, was naturally amazed to see the gem leap from his finger and fix itself in the shrine! A canopy concealed the whole on the day of the consecration; this was withdrawn at a signal, and the shrine appeared blazing with jewels on a ground of embossed gold—framed in gold-plated sides—before which the vast crowd dropped on their knees, at first overwhelmed with the glory, next eager to touch and be healed. The accompanying etching is a facsimile of a picture of the shrine in an old Cottonian MS., which was partially destroyed by fire in 1731.

It was not only to touch the shrine of St. Thomas, and be made whole, that the pilgrims from all parts of the country flocked to Canterbury; the old pagan belief in the potency of sacred wells, which had long been universal, was improved by the appearance of a well near the Cathedral, which was declared to have been formed by the dust and blood of the pavement where the martyr had perished being thrown on the spot. For two centuries this well was the marvel of the place, and its miracle-working waters were borne off in vast quantities in bottles. The vast number of booths and shops which lined the path to the cathedral-yard gave it the name of "Mercery Lane," which it still bears. Many old names and words may be traced back to the religious customs and conditions of medieval times. Philologists are divided as to whether "Canterbury" is derived from "Kent" or "Cant" (*i. e.*, the *chant* of pilgrims), and whether "to canter" did not originally describe the pace at which pilgrims on horseback approached the town. We know that the pilgrims to the *Saint Terre* gave us

ANCIENT ETCHING OF BECKET'S SHRINE.

the word "sauntering," and those to Rome gave us "roaming;" also that "tawdry" originally described the flimsy laces sold at the fair of "St. Audrey," or Etheldreda, patron saint of the Isle of Ely. Just before the Reformation the annual offerings at the shrine amounted to what would now be £4000.

Under these circumstances it is not to be wondered at that the Archbishop of Canterbury became the supreme potentate of Great Britain. A curious instance of the awe in which he was held by even the first noblemen in the land I quote here, as marking the high-tide of ecclesiastical authority in England.

From Dugdale's "Baronage" we learn that, in 1352, an Earl of Kent, grandson of Edward I., died, and his widow, Elizabeth, inconsolable, assumed the veil; but meeting accidentally the accomplished Sir Eustace Dabrischescourt, she was "unable to withstand the impression his agreeable behaviour made upon her heart, and, notwithstanding her solemn vow, was clandestinely married to him, before sun-rising, on Michaelmas-day, by Sir John Ireland, a priest," without having obtained a license from the Archbishop of Canterbury; "for which grave transgression both she and her husband, being personally convened before the same archbishop, at his manor-house of Mayhfield, upon the 7th ides of April, the archbishop, for their penance, enjoined them that they should find a priest to celebrate divine service daily in the chapel of our Lady, within the church of Wingham (by reason that the marriage was unlawfully solemnized in that parish), for them, the said Sir Eustace and Elizabeth, and him, the said archbishop; and that the priest should, every day, say over the Seven Penitential Psalms, with the Litany, for them and all faithful Christians, as also Placebo and Dirige for all the faithful deceased; likewise, that every

morning, being risen from his bed, that he should say five paternosters and aves, kneeling, looking upon the wounds of the image on the crucifix, and as many every night, in like sort; moreover, that they, the said Sir Eustace and Elizabeth, should find another priest, continually residing with one of them, to celebrate divine service for them in the same manner as the priest at Wingham was to do, and to say the Seven Penitential Psalms, and the Fifteen Gradual Psalms, with the Litany, Placebo, and Dirige, and commendation of souls from the quick and the dead; and also appointed him, the said Sir Eustace, and her, that the next day, after certain nuptial familiarities, they should competently relieve six poor people, and both of them that day to abstain from some dish of flesh or fish whereof they did most desire to eat; and, lastly, that she, the said Elizabeth, should, once every year, go on foot to visit that glorious martyre, St. Thomas of Canterbury, and once every week during her life take no other food but bread and drink, and a mess of pottage, wearing no smock, and especially in the absence of her husband."

From such a pinnacle of splendor and power was Henry VIII. to hurl the papal authority in England!

Those very pilgrimages to Canterbury—as one may gather from Chaucer himself—by the idleness and licentiousness they occasioned, paved the way for the Reformation. A Bishop of London—Simon of Sudbury—first cast a doubt upon the benefit of seeking the shrine (1370). The people execrate him, and eleven years after regard themselves as just avengers of St. Thomas when, under Wat Tyler, they drag him from the Tower, and behead him. A hundred and forty years later, the two first scholars of England—Colet and Erasmus—visit the shrine. Colet ventured to suggest that, if St. Thomas were still as devoted to the poor as when on earth, he would prefer a portion of the treasure on his shrine should go to their benefit now. All the wars of Cromwell were contained in the remark; and there is no wonder that the suave Erasmus had to pacify with some coins the scowling verger who exhibited the shrine. When the two were returning to London, an aged almsman by the way-side held up the "shoe of St. Thomas" for them to kiss. "What!" cried Colet; "do these asses expect us to kiss the shoes of all good men that ever have lived?" Erasmus must have found his irascible friend expensive. He again had to drop a pacific coin. But what of scholars? They have hardly gone home when Charles V. of France (fresh from Luther!) and Henry VIII. himself, and Wolsey, and the proudest nobles of Spain and England, are doing homage at the shrine, all unconscious that in a few short years one of their number was to sweep it all into a dust-hole! No earthquake could have shocked the people so much as what occurred in 1537. That year, on St. Thomas's Eve, Archbishop Cranmer "ate flesh and did sup with his family!" And

one world, at least, came to an end when, the following year, the King issued summons to the dead archbishop—"To thee, Thomas Becket, sometime Archbishop of Canterbury"—charging him with treason and rebellion. The summons was read before the shrine; thirty days were allowed for Becket to put in his appearance; and when, at the end of that time, he continued his contumacy, by failing to answer, the case was formally tried at Westminster, the dead man condemned, his bones ordered to be burned, and his shrine devastated. The jewels, however, were carefully picked out and carried away, in two coffers, by seven men. It took twenty-six carts to carry away the rest of the spoils—other shrines having been also devastated. The famous gem, the "Regale of France," already alluded to, was appropriated by the King for his thumb-ring, and the last trace of it was in the necklace of his daughter, Queen Mary. Every discoverable trace of the "blissful martyr" in the kingdom was destroyed—whether on heraldic devices or written records. Only in the stained windows did he remain. But all this had not occurred without a Thomas More ready to die for Becket.

What remains of that great shrine—itsself the regale of the Pope? A vacant space, fringed with the print of the knees of pilgrims, worn, in the course of generations, into the stone floor! The splendors of kings and archbishops have passed away; but the traces of the lowly worshipers survive, even as their reverence, which is not dead, but risen. I found nothing in Canterbury so impressive as these vestiges of the solemn march of humanity past its crumbling altars and shrines, in its endless search for that which "hath foundations" which shall endure. The knee-prints are thickest and deepest, as I have before said, about a spot concerning whose shrine or saint there is no record. As there would probably have been some trace about so popular a shrine if the image worshiped there had been a regular Catholic saint, there is good reason to believe that the figure represented to the converted pagans some alluring reminiscence of one of their former deities. From that shrine to that of St. Alfege, and on to those of St. Dunstan, St. Augustin, and, finally, that of Becket, the solemn pilgrimage of the human spirits may be followed, the few feet or yards between them representing centuries. Nay, though as we look back on the road the shrines may seem alike, and massed to one column of superstition, they were really mile-stones of faith, and signify the rising of successive ideas. Mingled now are pagan altars and Catholic shrines in common dust, but the devotion which knelt is not effaced. Thus there be high things that are laid low, while the humble are exalted. All that Augustine and Becket sought to perpetuate is lost; but the aspiration of the people is the victorious history of English and American freedom. So much is still attested by those marks of human devotion which alone remain to mark the spot consecrated "To an unknown God."

MOSAICS NEAR BECKET'S SHRINE.

There are some curious mosaics in the pavement around the spot where stood the shrine, among them some zodiacal signs. These relics of the old astronomical religion were probably laid at the saint's feet on the same principle which led the Greeks to preserve the serpent, which the first settlers of their peninsula—the Pelasgi—had worshiped as sacred to Athena, at whose feet it was at the same time represented in token of her supremacy. Along with the signs of the zodiac are some mosaics of the vices and virtues.

After the services in the choir were over, one of the canons took a gentleman among the tombs, and invited me to accompany them. The canon was an old man, with a face replete with *bonhomie* as well as intelligence. He wore a velvet skull-cap, a common method the officials in cathedrals have of preventing the veneration which forbids hats leading to influenza. I gradually recognized, by this kindly guide's scholarly knowledge of the place, that I was with a gen-

tleman of great ability, and was hardly surprised to find presently that he was the Venerable Canon Robertson, late Professor of Ecclesiastical History in King's College, and the author of the most learned biography of Becket ever written. He is not yet sixty years of age, and is more Scotch than his new archbishop. The presence of such men as Alford and Robertson at Canterbury is one of those significant facts which meet one at every turn in the exploration of English institutions, whether religious or other, to admonish us against the wholesale condemnation of them on their surface appearance.

THE VENERABLE CANON ROBERTSON.

MY MOCKING-BIRD.

MOCKING-BIRD! mocking-bird! swinging high

Aloft in your gilded cage,
The clouds are hurrying over the sky,
The wild winds fiercely rage.

But soft and warm is the air you breathe
Up there with the tremulous ivy wreath;
And never an icy blast can chill
The perfumed silence sweet and still.

Mocking-bird! mocking-bird! from your throat

Breaks forth no flood of song,
Nor even a perfect, golden note,
Triumphant, glad, and strong!
But now and then a pitiful wail,
Like the plaintive sigh of the dying gale,
Comes from that arching breast of thine,
Swinging up there with the ivy vine.

Mocking-bird! mocking-bird! well I know

Your heart is far away,
Where the golden stars of the jasmine glow,
And the roses bloom alway!
For your cradle nest was softly made
In the depth of a blossoming myrtle's shade;
And you heard the chant of the southern seas,
Borne inland by the favoring breeze.

But, ah, my beautiful mocking-bird!

Should I bear you back again,
Never would song of yours be heard
Echoing through the glen.

VOL. XLI.—No. 243.—23

For once, ah! once, at the dawn of day,
You waked to the roar of the deadly fray,
When the terrible clash of armed foes
Startled the vale from its dim repose!

At first you sat on a swaying bough,
Mocking the bugle's blare,
Fearless and free in the fervid glow
Of the heated, sulphurous air.

Your voice rang out like a trumpet's note,
With a martial ring in its upward float,
And stern men smiled, for you seemed to be
Cheering them on to victory!

But at length, as the awful day wore on,
You flew to a tree-top high,
And sat like a spectre grim and wan,
Outlined against the sky;
Sat silently watching the fiery fray
Till heaps upon heaps the Blue and Gray
Lay together, a silent band,
Whose souls had passed to the shadowy land.

Ah, my mocking-bird! swinging there
Under the ivy vine,
You still remember the bugle's blare,
And the blood poured forth like wine!
The soul of song in your gentle breast
Died in that hour of fierce unrest,
When, like a spectre grim and wan,
You watched to see how the strife went on!

THE ELECTRIC LIGHT.

STAGE EFFECTS OF THE ELECTRIC LIGHT.

THREE different methods have been discovered in modern times for producing an artificial light rivaling in brilliancy and intensity that of the sun. Although the light developed by each of these means is exceedingly intense, its characters and qualities are not the same in all. In each of the several forms it produces peculiar effects, and is adapted to different purposes.

The first is called the *Electric Light*. It is produced by passing a powerful current of electricity across a break of continuity in a circuit—the break being formed by two points of charcoal, connected respectively with positive and negative poles, and brought to within a short distance of each other.

The second, which is known as the *Lime* or *Calcium Light*, and sometimes as the *Drummond Light*, is produced by projecting an oxyhydrogen flame upon a small piece of lime. The intense heat of the jet of flame raises the lime to so high a temperature that it becomes intensely luminous. There are very few substances that can stand this heat without being fused and vaporized. But lime is sufficiently refractory to endure it, and thus, when the flame is playing upon it, the particles remain unchanged and immovable at their post, and disseminate in every direction the intense and dazzling luminosity which is produced by, or which accompanies, so high a temperature.

The third is known as the *Magnesium Light*. It is produced by the combustion of a rod of

magnesium, one of the metals discovered in modern times. This metal has so very strong an affinity for oxygen, in union with which it forms the substance magnesia, that it is with the utmost difficulty that it can be separated from it and produced in a metallic state. And when it is thus separated, it recombines with it with so much intensity of action as to develop light possessing, even for photographic purposes, almost the power of the sun.

It is only with the first of these three, the *Electric Light*, that we have to do in this article.

The forms and methods of arrangement of the apparatus employed for the development of the electric light are infinitely varied; but the essential things are in all cases the same.

1. There must be a battery, or other means, for inducing and maintaining a constant flow of electricity.

2. There must be wires or other conductors leading to the small charcoal cylinders on the termination of which the points are formed for the development of the light.

3. There must be an apparatus for moving one of the charcoal cylinders, as required, to keep the distance between the two points the same.

To accomplish this last object was for a long time a great difficulty. But without it—that is, without some method of keeping the break in the circuit always the same—the intensity of the light would, of course, constantly vary.

PRINCIPLE OF THE REGULATOR.

And it was necessary, moreover, that the movement should be automatic—that is, that the increasing distance between the points, as the extremities were gradually burned away, should *correct itself*—and not be dependent on a mechanism controlled by other means.

Difficult as it might seem to be to accomplish this end, the above engraving gives, in a simple form, an illustration of the possibility of doing it. The principle involved is that the nearer the charcoal points are to each other the more abundant is the flow of electricity across the interval. Now, the more abundant the flow of electricity along a conducting wire, the more powerful will be the magnetism which it will develop in an iron rod or bar which it is made to encompass. It is obvious that this gives us the power to regulate the distance between the points, by connecting one of them with an electro-magnet, and arranging the apparatus in such a manner that the narrowing of the interval shall increase the power of the electro-magnet, and thereby draw the point away, while increasing the interval shall weaken the magnet, and so allow the point to be brought up nearer by means of a counterpoise.

In the engraving we see the lower charcoal cylinder held in an iron tube, which is seen passing into an electro-magnetic coil near the base of the instrument. This tube plays freely up and down within the coil, being in equilibrium between the attractive force exerted by the coil and the weight passing over the pulley and acting as a counterpoise. The result of this arrangement is that, on an increase of the distance between the points, the magnetic force, which tends to draw the lower cylinder down, is diminished, and the counterpoise raises it up. But as soon as it approaches the upper point again, the flow of electricity is increased, the electro-magnet receives a fresh accession to its power, and the cylinder is drawn down again.

In describing this contrivance, inasmuch as we are obliged to speak of these two forces separately, and to describe the operation of each in its turn, the impression might easily be left on the mind of the reader that the result would be a series of oscillations, which would be any thing but indicative of steadiness in the light. But it is found in practice that these forces are so nicely balanced, and each follows so instantaneously in its action the least deviation in the conditions, that the result is a steadily main-

THE CHARCOAL POINTS—MAGNIFIED.

MAGNETO-ELECTRIC MACHINE.

tained equilibrium. In other words, the mechanism acts, practically, not in bringing the charcoal point back to its place when it gets out of it, but in preventing it from getting out of its place at all.

The regulators actually employed are much more complicated than this, but this illustrates the general principle of their action, in the most simple form.

The necessity for a constant regulation of the distance of the charcoal points arises from the fact that the action of the current causes a gradual consumption of the substance of the charcoal at the positive pole, occasioned partly by the combustion of it, and partly by the transmission of incandescent particles through the air to the negative pole. The engraving (p. 355) represents the appearance of the points after the process has been for some time continued. The luminous globules seen attached to the cones are the results of the fusion of earthy impurities contained in the charcoal. This gradual wasting of the points, especially of that connected with the positive pole, would gradually increase the distance between them, and so bring the process to an end, were it not for the action of the regulator.

To produce this light there must be a constant and powerful electric current, and to induce and sustain this requires the constant expenditure of *force* in some other form. In the case of an ordinary galvanic battery, the force is supplied by the consumption of the *zinc*; but, by means of a magneto-electric arrangement—that is, an arrangement for the development of electricity by means of a rapid succession of magnetic changes produced through the revolution of a series of electro-magnets within a system of permanent magnets—the force is supplied by

a steam-engine, or by the muscular power of a man; that is, by the consumption of the *coal* burned to drive the engine, or of the *food* digested in vital organs to supply the strength to the man. The light can be generated only by the expenditure of an equivalent force in some other form.

The above cut represents one of the forms of the magneto-electric machine, as constructed by a French company called The Alliance—a company established for the purpose of perfecting and manufacturing apparatus and machines of this character. It is only a general idea of its form, and of the principle on which it operates, that can be communicated by an engraving.

The principle on which it is constructed is this, that when a bar of iron changes its magnetic state, a current of electricity is instituted, during the moment of the change, in a conducting wire passing across the bar at right angles. Thus if a short, round bar of iron is wound with an iron wire, the two ends of the wire being left free, and the coil or *bobbin*, as the French call it, thus made is brought suddenly up to any strong magnet, an electric current is for the instant induced in the wire, which may be made manifest through proper observations, by means of the two ends. If now the bobbin be as suddenly withdrawn, another current in a contrary direction will be produced in the wire.

Of course the *actual production* of this effect does not depend upon the strength of the magnet, nor upon the suddenness of the approach and withdrawal of the bobbin. These circumstances only affect the result in respect to *degree*. The magnet must be powerful and the motions rapid to make the effect manifest.

The machine, then, is simply a mechanical

arrangement for causing a great number of such coils as are above described alternately to approach to and recede from the poles of powerful magnets, in very rapid succession. The electric force is so prompt in its action that no possible rapidity of motion that can be given to the bobbins will confuse it or interfere with its sending two distinct currents through the wire in contrary directions, as the bobbins advance or recede. This is wonderful, but it is in harmony with the other wonder somewhat analogous to it, that a telegraphic message may be sent along a wire through this same agency, by means of a series of separate signals following each other in very rapid succession, without confusion, and moving at the rate of many thousands of miles in a second.

The machine illustrated in the engraving (p. 356) consists externally of eight ranges of powerful horseshoe magnets arranged around a hollow cylinder, with the poles turned toward the axis of the cylinder. There are seven of these magnets in each range, making fifty-six in all. This whole system is fixed to the frame of the engine so as to be immovable.

In the centre is a revolving cylinder which nearly fills the opening left between the poles of the magnets, and upon this cylinder are fixed a set of double coils or bobbins, making one hundred and twelve in all. The ends of some of these bobbins are seen in the engraving. The precise arrangement of the mechanism connected with these coils can not be fully explained. All that it is necessary, however, for the reader to understand is that they are so placed that on causing the inner cylinder to revolve, the ends of the bars which form the cores of the bobbins are brought in rapid succession into close proximity to the poles of the magnets, alternately approaching to and receding from them with great rapidity. The consequence is that a series of electrical impulses is given in the wires coiled around the bars, each impulse being in the opposite direction from the one preceding it. These currents, almost instantaneous in respect to duration, succeed each other with inconceivable rapidity—the rapidity depending, of course, on the speed of the rotation of the cylinder bearing the bobbins.

It is necessary that the speed should be great, for as the light, at the break between the charcoal points, only shines while the current is passing, and, moreover, as it changes its action somewhat according to the direction in which the current flows, it is plain that a slow motion

THE ELECTRIC MICROSCOPE.

of the coils over the poles of the magnet would produce only a series of flashes, with perceptible intervals between them. It is found that by giving the cylinder a speed sufficient to produce about *two hundred electric impulses in a second*, the eye can no longer take cognizance of the interruptions, and the result is a uniform and continuous emission of a most intense and brilliant beam.

Such a machine may be driven by means of any convenient mechanical power. In the engraving it is represented as impelled by a pulley and band from a steam-engine in an adjoining apartment, as shown on the right. On the left is the stand containing the charcoal points, showing the light developed between them, and the apparatus for regulating the distance which separates them below.

One of the most curious and striking illustrations of the modern doctrine of the correlation of force is shown in this instrument by the fact that, although the central cylinder, bearing the bobbins, the turning of which seems to be all the work which is required to be done, is so nicely mounted, and on bearings so delicate as to call apparently for the exercise of only a very slight force to make it revolve, namely, that resulting from an almost inappreciable friction, it really requires a *two-horse power* to work the machine. The resistance comes from certain influences of the magnetic and electric agencies in their action upon each other, which influences have to be overcome by force, and this

force is precisely that represented by the light developed at the break in the circuit. The machine is thus a contrivance for converting mechanical force into electricity, and then from electricity into light.

The intense brilliancy of the electric light, and the extreme concentration of the radiant point, render it remarkably suitable for the microscope and the magic-lantern. The engraving (p. 357) represents the manner of employing it for the microscope. The electricity is produced in this case by a galvanic battery, as shown by the jars on the floor, instead of by a magneto-electric machine—that is to say, the source of the power is the consumption of *zinc*, and not the consumption of coal.

The first attempt to employ the electric light in the construction of public works was in the building of the bridge of Notre Dame, at Paris. The experiment was perfectly successful in enabling the workmen to continue their labors through the night, and in thus greatly diminishing the time required for the work. This trial was made, however, when the only mode of procuring the necessary electric power was by a battery, and the light was accordingly found to be quite expensive.

Since then the much more economical mode of employing magneto-electric machines, to be worked by mechanical power, has been discovered, and the emergencies in which this light can be advantageously used are rapidly multiplying. It has been tried in mines, in caverns, on board ships, and in light-houses, and also in the construction of such works on land and in the open air as are of an urgent character requiring night labor.

Although the electric light rivals in brilliancy

that of the sun, the appearance is very different when employed for purposes of general illumination, on account of the extreme concentration of the radiant point, which makes the contrast of light and shade so sharp and decisive as to produce a very peculiar effect. The light of the sun, besides radiating in the first instance from a comparatively wide surface, is greatly diffused in passing, for so great a distance, through the earth's atmosphere. Every minute globule of water which floats in the air, every mote, every particle of dust, every microscopic insect and seed and spore, intercepts a portion of his beams, and becomes a new centre of radiation. The result is a general illumination of the whole sky, and a diffusion of the light before it reaches the abode of man, which adapts it far more perfectly to his various wants.

The electric light has already begun to be practically employed, not only for the purposes above referred to, but also for light-houses and signal lights on board ship, for both of which it is admirably adapted on account of its great penetrating power in misty and foggy states of the atmosphere. It is also found to be well fitted for the production of stage effects in operas and theatres. It is used for this purpose in Paris, and to some extent in this country. It has also been employed as a signal light from the mast-head of a ship, in one of the steamers of the French line, and has thus been displayed in New York Harbor, attracting great attention from all who beheld it. The probability is that the employment of it for these and other uses will greatly increase; and it is by no means certain that it may not in the end be found to be the most effective and economical mode of illuminating large public halls.

NIGHT-WORK BY ELECTRIC ILLUMINATION.

A VISIT TO BANGKOK.

THE KING OF SIAM PROCEEDING IN STATE TO VISIT A TEMPLE.

THE Asiatic squadron of our navy has within its limits some of the most remarkable places in the world; extending from Singapore on the south to Siberia on the north, it has the extremes of climates, and almost the extremes of peoples; for Singapore is English, and Siberia is almost savage.

Our government had sent out three gun-boats to aid in the suppression of piracy in the China seas, and to one of these it was my fortune to be attached. Our station comprised the southern waters of China, and a stay of ten months in "Hong-Kong and the adjacent waters" found us quite ready for a change. We preferred to go to Japan and spend our summer there; but our wishes were as nothing, and we were sent to Siam as the bearers of a present of arms and ammunition to the Prime Minister from our Navy Department, with a letter from the Secretary of State and the other necessary accompanying documents.

Our passage of ten days had nothing of unusual interest in it; it was simply steaming slowly (for we could do no more) against the southwest monsoon, under a cloudless sky and a burning sun.

The coast of Siam, about the mouth of the river Menam, on which Bangkok is situated, at

a distance of forty miles from the sea, is very low—so low, indeed, that the first trees and shrubs grow in the water, the land being visible only at low tide.

As we crossed the bar and entered the river, just before sunset, a most beautiful sight met our gaze—an island covered with a temple of unique architecture, glowing like burnished marble, and looking more like a creation of fairy-land than I supposed any thing of mortal building could look. So tortuous was the channel that we passed by three sides of this thing of beauty. I can not attempt to describe it; nothing but an engraving could do that. It seemed impossible that any Eastern people of to-day could erect such a structure; but we learned afterward that it was of brick, white-washed. This detracted from the idea of difficulty, but it could not diminish its beauty. The banks of the river were very low; and some of the officers going to the mast-head, reported that nothing could be seen save a vast expanse of green, as far as the eye could reach. As we passed up the stream we saw oranges and bananas in profusion, with here and there a temple with its attendant out-buildings raised on piles, to be clear of any unusual rise of the river. We heard the chattering of monkeys, but could

see none, though the pilot pointed them out to us. We passed numerous boats, some ships, a few houses, and the openings of very many canals, which led to various places in the surrounding country, and which were the only lines of communication. It was dark for an hour before we reached the anchorage; and it was rather unpleasant to be going along with a strong flood-tide among fishing-boats, and possible floating houses; but our pilot knew the way; and keeping in mind the Mississippi expedient of sounding the whistle before rounding a curve, we reached the city in safety, and let go our anchor just in time to avoid swinging into a huge Chinese junk. In the morning the junk moved away from our neighborhood, evidently disliking our company.

The first thing to be done was to advise the Consul of our arrival, and request him to communicate with the Prime Minister the mission upon which we had come. Pending the Consul's appearance, a messenger from the Minister appeared in the person of his nephew, as bright and intelligent looking a young man as one would wish to see. He was neatly dressed in trowsers, jacket, and waist-scarf, but wore neither hat nor shoes. His hair was cut in the Siamese fashion—short, except for a prominence not unlike a shoe-brush, and about as long, extending from the front to the crown of the head. He inquired the reason of our coming, and was told that the Consul would communicate officially with the Prime Minister, or "Kalahome," as he is called in Siam. Whereupon he disclaimed any desire to go beyond the bounds of "red tape," and said that he had been sent merely to welcome us to the capital. The Consul (a missionary) came on board, and soon dispatched his letter, requesting an audience as early as possible. In the afternoon an answer came, appointing the next day at ten o'clock for the reception of the presents.

During the day we had something of an opportunity to look about us; we found that we were anchored some two miles from the King's palace, and about half a mile below the foreign residences. The city extends along the bank of the river, here very narrow, for several miles—ten, I should think—and by no means appears to be as populous as it really is. The river forms the principal highway, and its surface is covered thickly with boats from morning till night. Here may be seen all descriptions of water craft; from the tiny canoe, propelled by one paddle, to the royal barge with one hundred and fifty rowers; from the native sail-boat to the full-rigged foreign ship or the smoky steamer. A canal extends entirely around the city, with numerous cross canals, so that access by water to all portions is very easy. There are but few horses, and these only about the grounds of the King and nobles, and a few at the hotels; there is a road, about a mile or more in length, which the late King constructed for the benefit of the foreign residents. There are but few streets, and these very narrow; but the various palaces

THE ROYAL BARGE.

and temples generally have wide open spaces by which they are approached from the water.

There are about two hundred Europeans in the city, principally missionaries and merchants, with their families. The chief of police, the harbor-master, the pilots, several captains of vessels, and some naval officers are foreigners—chiefly English and American. A Frenchman is at the head of the army. There are very many Chinese, mainly from the district about the city of Swatow, who are by far the most industrious people in the place: they are found in all trades, and the poll-tax levied on them forms no inconsiderable portion of the royal revenue. The entire population is variously estimated at from 50,000 to half a million; from information derived from the missionaries and from some of the natives, I should conclude that it is in the neighborhood of a quarter of a million, or about one twenty-fifth of the population of the entire kingdom.

The boats used by the Europeans are of a form more convenient than any that I ever saw elsewhere; they are about twenty feet long, with a house in the centre to accommodate half a dozen people with ease. Two men standing in the bow, and two in the stern, *push* their oars in the water, the rear one managing the tiller with his feet. The speed which they manage to get with this very original method of rowing far surpasses that of the ordinary style, and the work is accomplished with much less fatigue. They will push for hours at a time, stopping only for an occasional draught of water from the river.

A large number of the people live on the water; the poorer in their boats, those of more wealth in floating houses. These curious edi-

KING OF SIAM.

fices are built upon rafts of bamboos about four feet thick, and are by no means devoid of pretense to architecture. The material of which they are constructed is generally teak-wood, with thatched roofs. They usually have a veranda in front; and here are exposed for sale the wares of the occupant, or it is used as a play-ground by the children. I visited a native photographer's, and was shown over the whole house. In the veranda was a swing for the youngsters; the front room had a bare floor, with a centre-table and half a dozen chairs; several photographs adorned the walls. The bedrooms opened off this, with sliding doors, and the kitchen opened out on a back-yard of water. The river furnishes water for all purposes, and is at the same time the common sewer of the city. The houses are moored with bamboo cables to bamboo piles driven in the bed of the river, so that they can rise and fall with the tide, and yet not be carried away by it. They certainly possess one advantage, that of being easily moved; the occupant desiring to change his location has only to unmoor his cables, take advantage of the tide, and go up or down stream as he chooses. It is a novel sight to see one of these edifices come drifting down the stream at night, brilliantly illuminated, and with no noise or confusion apparent. Most of the houses are built upon piles, near the river bank, only the palaces being built of brick or stone.

During the afternoon we received a present of a very large quantity of fruits, sweet-cakes, etc., from the Minister of Foreign Affairs, "by direction of his Majesty the King;" and nearly every day some such attention was paid us by some of the dignitaries of the court. During the day we were called upon by several of the

PRIME MINISTER OF SIAM.

A THEATRICAL PERFORMANCE IN BANGKOK.

foreign residents; the ship was surrounded by native boats, but none of the occupants ventured on board. It was quite a sight for them, as this was the first American man-of-war that had ever ascended the river, and the ship was much larger than the English and French gun-boats that had been there.

It was too far from our anchorage to the landing for our boats' crews to pull in the burning sun and against a strong tide; so we were provided with three of the house-boats, each with an American ensign at the stern, that I have described, and as many of the officers as could be spared from duty accompanied the presents. After an hour's ride we landed (?) on the veranda of a floating house, where we were met by the Kalahome's nephew, and invited to walk in. We sat down in a room furnished in the fashions of the West, and waited a few moments while horses were procured. On going ashore I declined to ride; so the Consul walked with me while the rest rode. The boxes containing the presents were carried by a number of coolies, the rear being brought up by two of our petty officers, who kept guard over the property. Our way lay through very narrow streets, mostly on the banks of a shallow canal, and I was very glad that I had chosen to walk, for the horses were rather wild, and one of the officers had his leg badly squeezed against a wall. We found the Kalahome's palace to be situated about fifteen minutes' walk from the river, and surrounded by a high, whitewashed brick wall. The gateway was rather a grand affair of columns and arches, and gave entrance into the court-yard. The main entrance to the building was a high portico opening into a large

hall paved with stone. Here we found a number of servants busily engaged in cleaning the arms with which the Kalahome had been presented at various times, and some of which were kept here. On either side the main building was a row of small edifices for business and other purposes.

We had hardly deposited the arms when the door at the head of the hall opened, and the Kalahome made his appearance. He walked up to each one of us and shook hands, bowing us toward the inner room. Here we had an opportunity of observing the manner which each class of Siamese uses toward any of higher grade. The attendants who were cleaning the arms ceased their occupations, and, with bended knees and bowed head, waited until their master had left the room. This custom is universal, the highest princes in the land yielding this obeisance to the king, the nobles yielding it to the princes, and so down through all grades. Servants act thus in presence of their masters, performing all their commands in this abject attitude, presenting a most curious sight to the eyes of foreigners.

We entered the reception-room by a short flight of stone steps, and were motioned to seats about a table, at the head of which the Kalahome sat. He was dressed in a thin jacket, with a waist-cloth of silk reaching just below his knees; on his bare feet he had a pair of grass slippers. This room had a stone floor, and was furnished with chairs, sofa, and tables of European manufacture. There were many ornaments in the shape of marble vases, mirrors, and several specimens of fire-arms.

The Captain delivered the letters from the

government, together with a short address from himself, and they were translated by the Private Secretary (an Englishman). The arms were then brought in and examined, and it was not until then that the Kalahome spoke any English. He began to make some remarks about the visit of former ships to the outer anchorage at the mouth of the river, and of his visits to them; spoke of the new improvements in small-arms, and evidently understood what he was talking about. Coffee was served, and after considerable desultory conversation we came away, the Kalahome having accepted an invitation to visit the ship. We also made arrangements as to a salute, the harbor regulations forbidding it; but in consideration of our special mission the rules were relaxed. On our return to the ship we fired a salute of twenty-one guns, the Siamese flag at the fore, which was returned at once, gun for gun, from a fort on shore.

The next morning, about ten o'clock, the Kalahome came on board with his suit, among them Prince George, son of the late second King, who is the Kalahome's assistant in naval affairs. We had ascertained that he desired to see the guns worked, so gave him the salute of seventeen guns as soon as he came on board. The old gentleman evidently meant business, for he asked to have our Parrott gun exercised, and its construction explained, watching every detail with great interest; he explored the whole ship, from stem to stern, and inspected her thoroughly. He was not at all averse to the Champagne with which he was treated, and expressed himself highly pleased with his visit,

particularly so with regard to the guns. He invited us to visit the new vessels that he was building, and departed in high good-humor. We were most favorably impressed with him, and the more I saw of him the more I liked him. From his position as Prime Minister he is one of the most powerful men in the kingdom; add to this that he is the head of the most powerful, wealthy, and numerous family in the country—that to his personal endeavors the King owes his seat upon the throne, that through his instrumentality the trade of Siam has increased tenfold, that the taxes have been greatly reduced, that ship-building after the models of Western nations has become a very important industry, and that he is the most far-seeing and enlightened of the nobles, and that he is gradually leading the mass of the people up to his stand-point—it may safely be said that he is the actual ruler of the kingdom, though he does not wear the crown.

In the afternoon we went to the palace to a private audience with the King, he having sent word to us that he would be pleased to have us call at three o'clock of this day. He is notoriously unpunctual; but we couldn't count upon that, so were on hand at the hour, accompanied by two of the missionaries as interpreters. We went to the landing in the same way as before, and were there met by an officer of the royal household, who desired us to wait until conveyances were provided. Soon horses were brought, and sedan-chairs, which latter were only a shade better for riding than the horses. We pursued our way through narrow streets for some dis-

COURT-YARD OF THE KING'S PALACE.

A PRINCE OF THE BLOOD.

tance until we came upon the road of which I have spoken before, which passes in front of the palace. The palace grounds are of vast extent (we were told that they contained one square mile), and are entirely surrounded by a high wall. Within the wall are not only the palace itself, but several private chapels, numerous buildings for horses (and carriages) and elephants, barracks for soldiers, and the forbidden ground devoted to the habitations of the royal ladies, with their surroundings. The gateway itself was very simple, closed with two massive doors, a sentinel on either side. We were met here by the Kalahome's nephew (to whom seemed to be assigned the duty of seeing to our wants), and desired "to wait the royal pleasure." While so doing we were regaled with quite good music from a brass band, under the leadership of a Frenchman. We were also invited to see the royal white elephant, the sacred animal of the Siamese. We found him in a building apart from the rest,

his fore-legs chained to a huge post in the centre, a gilded canopy over his head, and an attendant to keep watch of him continually. This attendant fed him for our benefit, and he seemed to enjoy his food quite as much as those of his kind that we see in traveling menageries at home.

Presently a messenger informed our conductor that the King was waiting; the guards fell in, and we passed through their ranks into three distinct court-yards before arriving in that portion of the palace inhabited by the King.

This was a large edifice, with a fine flight of steps leading up to a noble portico in front of the public audience-hall. We passed along the sides of the building by a path through a well laid out and neatly decorated flower-garden, until we reached the stairs leading to the private audience-room. Our conductors had hitherto been walking, but on ascending the stairs assumed the posture of humility before described, and so crawled into the royal presence. We were ushered into a room some thirty feet square, elegantly furnished in Western style, and found the King advancing to meet us. He shook hands cordially with each one of the party, inquiring as to the rank of each, and then asked us to sit down at the centre-table, he taking the head, and we sitting at the sides in order of seniority, the Captain on the King's left. I had a fine opportunity of observing this remarkable specimen of Asiatic royalty. He was, I should

THE HEIR-APPARENT.

A SIAMESE TEMPLE.

judge, about sixty or sixty-five years old, and about as unprepossessing in appearance as can be imagined. His eyes were nearly closed, and he had a sort of sleepy look and drawling voice, which did not at all accord with the words he uttered. He was constantly chewing betel, supplied him by a servant prostrate at his side, and the juice ran down his chin, rendering his whole appearance almost repulsive. He was dressed in crimson silk, with a huge star of diamonds on his breast, but with no other ornament whatever. His conversation was addressed principally to the Captain, and during our stay of over an hour he showed himself to be possessed of an amount of information astounding in a person in his situation. After asking as to our mission, and discussing the qualities of various arms, he asked if we had seen the steamer that the Kalahome was building for his use on the occasion of the eclipse of the sun soon to take place. He then went on to speak of his calculations of the eclipse, and gave us quite a lecture on the various objects to be looked after in observing the phenomenon—all of his conversation being in well-chosen English. Several of the young princes came into the room, and seemed very much attracted by the glitter of our uniforms: one of the officers had quite a conversation with them through the eyes. Coffee was served in French china cups, inscribed, "Royal Palace of Siam," with an elephant as

crest. The Crown Prince was introduced to us, a youth about fifteen years of age, and made quite a favorable impression upon us; he spoke English quite well. The King closed the audience very abruptly (as is his custom), by extending his hand to the Captain, and saying, "Good-afternoon," when we withdrew. We were then shown into the public audience-hall—a fine room, with a row of columns through the centre, and a latticed private gallery on the sides for the ladies of the harem. The throne was elevated some eight feet from the floor, carpeted with velvet, and overhung by a velvet canopy somewhat like a huge umbrella, of several stories, each one decreasing in size toward the top. There was a private entrance from behind for the use of the King alone. There were very many portraits, busts, and various other ornaments about the room; conspicuous among the portraits were those of President Jackson and Queen Victoria, with the American and English colors intertwined over them. There were busts of Napoleon and Eugénie, together with several articles of French manufacture—notably a fine clock presented by the Emperor. While we were looking about us the King came in, and calling the Captain to him, gave him a pamphlet containing information as to the Siamese custom of having two kings, written by himself, and published at the American mission press. He also called attention to

PAGODA.

a copy of Bowditch's "Epitome," which lay upon a table, and said that the Crown Prince was studying it. He declined an invitation to visit the ship on the score of ill health, but said that he would send the Crown Prince; and we came away quite well pleased with our visit.

On our way back we visited the temple of the great idol of Bangkok. An immense inclosure surrounds the temple itself, filled with houses for the priests, and with various other out-buildings, among them a beautiful library, where are contained the sacred books. The temple is about two hundred feet long by fifty broad, with a high-peaked roof about one hundred feet from the ground. It is surrounded by a colonnade, which adds materially to its beauty. The windows are simply oblong apertures, closed with heavy ebony shutters; the doors are also of massive ebony; both shutters and doors being finely inlaid with mother-of-pearl. Before reaching the building we passed through three rows of corridors, which surround the temple on all sides, and are filled with life-size gilded images of Buddha. There are in all between nine hundred and a thousand of these idols. But the chief

attraction of this great edifice is the reclining image of Buddha: it is 165 feet in length, representing the god as lying on his side, his head supported by his hand. This image is built of brick, and is thickly gilded through its whole extent. The soles of the feet are sixteen feet in length and nearly four feet broad; they are inlaid with mother-of-pearl in the most exquisite manner, representing the various fruits and flowers that are fabled to have sprung in the footsteps of the god wherever he walked on earth. The arm at the elbow is about six feet thick; the head is elevated about fifty feet in the air, and is covered with gilded snail shells instead of hair—the snail being a sacred animal. The expression upon the features of the image is a remarkably successful attempt to convey the idea of perfect rest and composure, that being the Buddhist idea of the last state of man; and, indeed, this same absolute stillness is successfully depicted on the countenances of all the many idols that I saw. Even the old images of the ancient capital have it in the same degree.

The next morning was devoted to a tour among the more prominent temples with some

GATE OF TEMPLE.

of our missionary friends. The general characteristics of these edifices are similar; only in their internal adornments do they differ. The roofs are covered with colored tiles, and at the gable ends is a gilded horn. In all the temple grounds are scattered pagodas of two classes: one class of brick, whitewashed, shaped somewhat like a succession of compressed globes, and terminating in a pinnacle, making as beautiful monuments as can be found any where; the other class are square at the foot, rising gradually in terrace fashion, and terminating in four columns surmounted by a dome. Generally there is a statue of an elephant beneath this dome; but sometimes the whole edifice is entirely solid. The exterior of the pagodas of this class is covered with colored porcelain, and the effect, from a distance, is striking in the extreme: a nearer inspection, however, shows the work to be rather coarsely executed.

The largest of these pagodas is situated in the grounds of the second temple in the city (in size): it is one hundred and fifty feet square at the base, and is two hundred feet in height. There is a pair of stairs on each face, by which

the ascent is made to the highest terrace, at the foot of the dome, nearly one hundred and fifty feet. This huge pile is entirely covered with colored porcelain, and has many statues of griffins, elephants, and the like scattered over it. The dome contains four colossal statues of three-headed elephants, each facing toward one of the cardinal points. The view from the top of this pagoda was beautiful in the extreme: at our feet were the spacious grounds of the temple, with its chapels, its habitations for the hundreds of priests who perform the services, and its extensive pleasure-grounds. Farther away the river spread before us its varied panorama, more easily imagined than described; as far as the eye could see over the country it was one vast plain rich in all vegetable life—on the whole, a scene never to be forgotten, and needing to be seen to be fully appreciated. In the main building of the temple itself was a huge idol representing Buddha as sitting with crossed legs. Its height from the altar was estimated at seventy-five feet; one of us stood at the knee, and his head did not reach the top of it. This was also profusely gilded; and the doors and shutters of the building were adorned more elaborately than any others that we saw. We were fortunate enough to go into a private chapel where worship was being conducted by about one hundred priests. Each was clad in yellow, with shaven head. The service appeared to consist merely of the continued repetition of a monotonous chant, the words of which meant, "Let it be so." There was no music, but all followed the leader in most admirable time, and it was pronounced by some of the musical members of the party to be superior to any operatic chorus that they had ever heard.

I never realized before what the "vain repetitions" of the Bible meant. Our time was limited, so that we visited only two of the more important of the temples, and then hastened to the ship to prepare for the reception of the Crown Prince. He made his appearance in a magnificent gilded barge, with fifty rowers, seated in a chair of state at the stern, with the gilded nine-storied umbrella over his head. His personal suit was small, but we noticed that he had the usual complement of servants, with the betel-boxes, cuspidors, pipes, etc., all of pure gold. He was received by all the officers in full dress, conducted all over the ship, and finally sat down in the cabin, evidently pleased with his visit. He was much interested in some pictures of China and Japan; and evinced such a decided admiration for a Burnside rifle that the Captain told him he might have it, and had it sent into his boat. He conversed quite fluently in English, but preferred to use an interpreter when many of us were about. On leaving we manned the yards, and saluted him with a royal salute of 21 guns, the Siamese flag at the main.

During our stay Prince George, whom I have mentioned before, came to see us several times: we found him to be a quiet, unostentatious in-

dividual, but possessing an amount of knowledge of naval and military matters which would be by no means contemptible in a person of a more enlightened race. He was very eager in the pursuit of more intelligence on these subjects, however, and was particularly pleased with a text-book on gunnery which the Captain presented to him. On his first visit he spoke at once to the Captain about a salute (to which, of course, he was entitled), and desired that it should not be fired, as he came in a private, friendly, and entirely unofficial manner; and his frequent visits were all paid in the same unambitious style. He was engaged in superintending the construction of a gun-boat for the Kalahome; the work being done by Siamese carpenters from designs by an English ship-builder. The engines and boilers were constructed in England, and were being placed in the ship by natives under the superintendence of an English engineer. The interior arrangements of the vessel were analogous to those of our own and other vessels of war; and the whole ship was a decided credit to these people, whom we are accustomed to look upon as half-civilized.

One day the Minister of Foreign Affairs requested us to call, and came to the "court-house" to receive us, as "it was too hot to ask us to come to his palace." While waiting his arrival we had a chance to see some Siamese justice administered; there are no lawyers, so the plaintiff and defendant each pleads his own case, and a nice noisy time they had of it, too. The judge sat grave and silent, as became his office, occasionally throwing in a word or two to quiet the disturbance. The Minister at length made his appearance, accompanied by the usual array of betel-boxes, etc. He is a brother of the King—a quite good-looking specimen too, though inclined to obesity. We conversed by means of interpreters, the Prince inquiring particularly as to our ship and mission. He gave us a lunch of fruits and confections, and we soon after left. We called to see another of the King's brothers, a retired Minister; his infirmities were such that he no longer mingled in public affairs. His palace was much less of a building than the Kalahome's, and the audience-hall bore as much resemblance to a furniture auction-room as to any thing else. He is the possessor of a diploma granted by a medical college in Philadelphia, I think, and of it he is very proud.

We were the recipients of many courtesies, both from the natives and the foreigners, during our stay of ten days. To the American missionaries we were indebted for guidance to the principal sights of the city, and for many other kindnesses. We left the city with regret, wishing that our stay might be prolonged; but our time was limited, and we were obliged to go to sea, arriving in Hong-Kong ten days afterward.

Since the first part of this article was written the King with whom we had our interview has

died, and the Crown Prince has ascended the throne, chiefly through the influence exerted by the Kalahome.

Prince George has been elected Second King, an institution peculiar to Siam.

Although the late King belonged to the party of progress, he was behind the Kalahome in his ideas. The young King, being more under the influence of his powerful vassal, has already inaugurated a policy which can not fail to be of benefit to his country. He has recently made treaties with Belgium and other European powers, and seems to invite foreigners to his domains. There is ample opportunity for Americans there, more than for others, for the government is already strongly prepossessed in their favor, and meets them more than half-way in their advances.

THE AUTO DA FÉ OF 1755.

THE first day of November, 1755, broke fair and bright over the sunny land of Portugal. The sun rose up from behind the Sierra in unclouded brilliancy, and shed a flood of golden light over the vine-clad hills, and the silvery waters of the Tagus danced and sparkled as they rolled lazily on to the broad bosom of the bay. The churches and palaces of Lisbon seemed roofed with gold, and soon the hovels and courts of the poor and wretched gave back a smile of joy as the bright sunshine, the common property of high and low, found its cheering way to their squalid retreats. Though the hour was early, the streets were thronged with the populace, dressed in holiday attire, and evidently in a high state of excitement. Laborers and serfs seemed to forget, on this occasion, their usual reverence and servility, for they jostled and shouldered the titled nobles who were scattered here and there among the crowd. The mitred bishop and highest functionaries of the Romish Church forced their way with difficulty through the excited throng.

This was the appointed day for the auto da fé, and streets, balconies, and windows were already alive with eager faces to witness the procession of condemned heretics. The execution was to take place at high noon, and as the fatal hour drew near the excitement became intense. The populace gave vent to their impatience by loud shouts, while all eyes were turned to the gloomy prison of the inquisition, whence the procession was to emerge. Though the proceedings of the dread tribunal, then at the height of its power in the kingdom of Portugal, were generally shrouded in secrecy, which none dared pry into or scrutinize, yet it had somehow transpired that an unusually large number of victims were this day to seal their fidelity to conscience by the baptism of fire.

At last the long-expected signal was given, and, as the deep-toned bells tolled the hour of noon, a hoarse murmur of satisfaction broke from

the anxious and inhuman crowd. The frowning portals of the prison were thrown open, and a strong guard of halberdiers opened a lane through the dense throng, and formed in close order on the right and left. Then a procession of robed priests, bearing a crucifix and chanting a *Te Deum*, issued from the doorway, followed by the victims who were doomed to be burned at the stake for daring to worship God according to His revealed will. Last of all came a group of nuns with veils over their faces and muttering *Aves*, and some of them, perhaps, prayers for the wretched beings in their front. There were a dozen or more of these unfortunates, of both sexes, and of various ranks. They were all dressed alike in the fantastic and hideous garb prescribed for such occasions.

There was a quiet composure about most of the prisoners; and some wore even a cheerful and triumphant expression of countenance. One of the party, however, seemed to attract most of the attention, and all the sympathy of the spectators. She was a young girl, scarcely sixteen years of age, whose wondrous beauty even the rude garb in which she was clad could not disguise. Her large dark eyes were raised imploringly toward heaven, and, at times, a low sob of agony would burst from her lips. She looked anxiously, now and then, into the surging crowd that inclosed the procession, as if searching for some loved and familiar form; but her gaze only encountered the strange faces of those who had come to gloat over her sufferings. And in this dark and dreadful hour had she, so young and so lovely, no friend on whom her tearful eyes might rest ere they were closed in death?

Far from the scene which we have just depicted, in the aristocratic quarter of the city, fond hearts were breaking for her sake, and crushed spirits were pouring themselves forth in prayer to the Holy Virgin that she might escape her terrible doom. Father and mother, fond brothers and sisters, had shut out the sunlight from their palatial mansion, and in darkness and despair were bewailing their utter inability to rescue their beloved Leonora. They knew, too, they would be courting a like fate were they to show even sympathy for her sufferings, and hence they had not dared to visit her since she had been condemned by the court of Inquisition.

As the procession moves on to the place of execution, just beyond the city limits, we will briefly acquaint the reader with the story of Leonora De Castro. She was the eldest daughter of Albert De Castro, one of the most accomplished noblemen of the kingdom, being a younger scion of the ducal house of Yavora. His house adjoined that occupied by Lord Effingham, the British Minister at the court of Lisbon, and though the father of Leonora was a Romanist, and Lord Effingham a zealous Protestant, they entertained a high regard for each other, and there was a frequent interchange of civilities between them. The children of the

two families became very intimate, and Leonora, in particular, spent much of her time at the house of the Minister. She even obtained her father's consent to study the English language with the children of that nobleman. Now, the tutor of Lord Effingham's children was a retired curate of the Church of England, with fully as much zeal for his faith as any Jesuit.

Being much pleased with the intelligence and capacity of his new pupil, the worthy curate, little dreaming of the dreadful consequences that would result from his interference, lost no time in pointing out to poor Leonora the errors of her faith. So assiduous was he in his efforts to "snatch a brand from the burning," that in a very short time she became as anxious to investigate the real truths of the Gospel as he could wish. He supplied her with a copy of the Scriptures, in English, and bade her consult its sacred pages to learn the way, the truth, and the life.

Leonora soon became satisfied that the faith of her fathers was not the true faith, and, being of an ardent temperament, she determined no longer to yield obedience to the absurd requirements and idolatrous practices of the Church of Rome. As soon as her parents became aware of the change in her religious sentiments, they resorted to every means in their power to reclaim her, but in vain. The family confessor, becoming apprised soon after of her apostasy, tried by reason and argument to convince her that she had been misled; but, finding all his efforts to bring her again into the bosom of the Church ineffectual, he advised her father to send her at once to the Ursuline convent at St. Ubes. He did so, hoping that the society of the holy sisterhood would be able to eradicate the seeds of heresy implanted by the "arch heretic" to whose charge he had so thoughtlessly committed his daughter. In vain did the lady superior of the convent exhaust all the ingenuity of which she was capable to bring back Leonora to the faith of her fathers. Every engine at the command of the Church was brought to bear upon her in vain. Her delicate limbs were subjected to torture, but she clung unflinchingly to her new faith. The lady superior, enraged at finding all her efforts at conversion vain, denounced her to the officers of the inquisition as a dangerous and obdurate heretic. She was removed from the convent to the prison, and with undaunted resolution, and with a faith that defied both danger and death, in the very presence of the Inquisitor-General, she gloried in the sufferings she was called on to endure for the sake of Jesus.

She was condemned to be burned on the first day of November, with others who had refused to recant and stifle their consciences by again returning to the bosom of the Holy Catholic Church. In accordance with this sentence Leonora was now on her way to the plaza, where every preparation had been made for its execution.

From the moment that the cortége had started from the prison a young man of noble mien, dressed in a garb that bespoke his high rank, had been struggling to force his way through the dense mass to the side of the captives. Though no deference was shown on this occasion to persons of quality, yet the prepossessing appearance of the young grandee, and the unmistakable anguish expressed in his face, operated in his favor, and the clamorous crowd allowed him to draw near the victims. This personage, seemingly so intent on beholding the dreadful sentence carried into execution, was the young Marquis of Elvas. A short time before Leonora had placed herself under the spiritual guidance of the English curate he had made her an offer of his hand and heart. The two families had been on terms of intimacy for years, and the prospect of a matrimonial connection was highly satisfactory to all parties. The lovers were passionately attached to each other, and were looking forward to a happy consummation of their betrothal when the terrible circumstances we have detailed broke in upon their dream of bliss.

The powerful families of the Marquis and De Castro had both exerted all their influence to have the punishment of Leonora mitigated, but the stern ecclesiastics had refused the slightest relief. A petition for a respite had met with the same fate. The young nobleman in his distraction and despair had cursed the pitiless rigor of the dread tribunal, and even dared to question its authority. By this course he had drawn upon himself the secret but certain vengeance of the Church. Though aware of the close espionage to which all his words and acts were subjected, he resolved to see and, if possible, offer some words of comfort to Leonora before she reached the plaza. He would at least assure her of his sympathy and unchanged affection, and then, rushing from the fatal scene of her suffering, which for worlds he would not witness, would forever turn his back on the priest-ridden land of his fathers.

Before he could reach her side, however, the procession had reached the goal that was, as he thought, to end forever his dreams of happiness. The captives had been drawn up in a line facing the bishop, who, on this solemn occasion, officiated as the representative of the Church. According to the usual custom, each of the condemned was urged to recant, while the direst pains of hell were denounced against such as should persist to the end in their abominable heresy. The evident distress of Leonora had induced the priest to believe that she, at least, would not prove to be finally obdurate. He even held out to her hopes of a respite, and perhaps of ultimate pardon. He alluded to her tender youth, her beauty and accomplishments, and hinted at the joys that life might yet have in store for her. He spoke of the distress of her heart-broken relatives occasioned by her apostasy, and the joy with which she would fill their hearts by a recantation, even at the elev-

enth hour. "And now, Leonora De Castro," continued the bishop, "will you retrace your erring steps? Will you discard the heretical opinions implanted in your youthful mind by that son of Belial? Our holy Church, ever lenient to the faults of her erring children, ever disposed to deal mercifully with such as confess their sins and repent, would receive you again to her bosom. Will you come?" He paused, while every sound was hushed to hear her response. Her agitation was now gone, and in a calm, clear voice, that was audible to many an ear in that anxious throng, she replied: "I can not acknowledge the authority of the Church you represent. I believe the faith I now profess to be the true one. There is but One who can forgive sin, and in His mercy do I trust. If I am called to die for His dear sake, I will try to bear my sufferings cheerfully, knowing that 'our light affliction, which is but for a moment, worketh for us a far more exceeding and eternal weight of glory.'"

The astonished churchman, enraged at the unexpected reply of the fair captive, and fearing its effect on the populace, ground his teeth in fury, and ordered the fires to be lighted at once, and the prisoners to be bound to the stakes, adding, in a stern tone, to the brave young girl, "Obdurate wretch! this day shalt thy soul writhe in the fiery torments of the damned; thou shalt soon enjoy a foretaste of thy doom." Leonora, whose nerves had been greatly weakened by the long trial to which they had been subjected, shocked at the barbarity of the prelate's rude address, staggered, and would have fallen to the ground, but the young Marquis now rushed forward and caught her in his arms. "Inhuman monster," he exclaimed, addressing the bishop, "she is fitter for heaven than such as thou. If there is an angel in the presence of God, she will soon be one."

"Ha, my lord Marquis," cried the prelate, "these are bold words, but they have sealed your doom!"

"Arrest the Marquis of Elvas," he said to the provost; and that officer was just stepping forward to obey the order, when a low, rumbling sound was heard, followed by a sudden shaking of the earth that cast every one prostrate on its face. An immense wave, towering in its might, came rolling on from the Tagus, and quenched the impious fires that had been kindled to consume those who trusted in Him "who heareth the young ravens when they cry." In a few seconds the shock was repeated, and cries of terror and dismay came rolling up from the doomed city, mingled with the appalling crash of falling buildings.

All was consternation and universal panic. The mad multitude so lately clamorous for the inhuman sacrifice, and who had come out from the quiet city to gloat over the sufferings of their fellow-creatures, now terror-stricken at the rebuke of their great Creator, fled aghast, pale with apprehension for the fate of dear ones who

were perhaps crushed beneath the falling domes and towers. The condemned heretics had been saved by a miracle, and perhaps the awful visitation had fallen with crushing weight on the heads of those who had been most eager for their blood. The prisoners, indeed, were forgotten in the dreadful crisis. When the crowd had dispersed the Marquis of Elvas caught up Leonora in his strong arms, and bore her, by a circuitous route, to the city, and, threading his way through the wild débris of the city, reached in safety, with his precious burden, her father's house, which had in a great measure escaped the general wreck.

Words can not express the joy with which the whole household welcomed back their darling, rescued so unexpectedly from the very jaws of a horrible death. But their feelings of unalloyed pleasure at her deliverance soon became mingled with apprehension lest the officers of the Inquisition might institute a search for the persecuted victims who had, for a time, escaped their vengeance. Preparations were commenced for immediate flight. The Marquis, whose situation was now as full of danger as even that of Leonora, was soon ready for any road, no matter where it might conduct him, so it placed him outside of his native kingdom. He had resolved to accompany Leonora, who would also be attended by a faithful servant of the family, none of her immediate relatives daring to bear her company through fear of the consequences that would attend such a step. It was determined to push rapidly across the country to the neighboring kingdom of Spain; and the Marquis felt satisfied that if they could reach the mountains in safety the danger of arrest would be slight. Should the authorities, however, be on the alert, he knew there would be great danger in attempting to leave the city.

Their situation, at best, was full of peril. Notwithstanding the terrible catastrophe that had befallen the city, and had so miraculously preserved Leonora from the stake, it was vain to suppose that the Church, foiled in its attempt at present punishment, would fail to bring the condemned to the flames if rearrested. While preparations were going forward for their flight, Lord Effingham, who still represented his government at the court of Lisbon, called to condole with his friend on the terrible calamity that had visited the city, and which he supposed must have quite overwhelmed a family so terribly afflicted by the dreadful fate of a beloved daughter. He was soon informed of the escape of Leonora, and of the hasty preparations that were making for their flight. After listening attentively to the proposed arrangement, Lord Effingham shook his head and remained silent for a few moments, and then expressed his fears

lest the project would miscarry. "I feel quite certain," he said, "that by attempting to leave the city you will bring destruction upon yourselves; indeed, I am surprised that your house has not already been searched. So soon as some degree of quiet is restored, active measures will be taken to arrest the fugitives. You must not attempt to leave the city just yet. Nor will it do to remain here. You, my lord Marquis, and Leonora, must take up your abode for a short time with me. They will hardly dare to search the house over which floats the broad flag of England. And now I think of it," continued the Minister, "some members of my family and suit will soon return to England, and we can perhaps manage it so that you can leave the country in their company."

This proposal was embraced with eagerness, and our hero and heroine returned with Lord Effingham to his own residence just in time to escape the officers, who came to the house they had just left almost immediately after their departure. The father of Leonora expressed the greatest surprise at the visit of the officers, and, to carry out the deception, seemed to be plunged in the deepest sorrow, protesting to be ignorant of her escape. As no one had seen her return to her father's house or leave it, no clew was obtained to her present whereabouts. Some days were spent in quiet and security in the asylum generously furnished by the English nobleman. Leonora had ever been a favorite with the whole family, and all strove to banish from her mind every remembrance of the terrible ordeal to which she had been exposed. The bright color of youth came back to her cheeks, and the glad smile of hope lighted up her countenance. The worthy curate, whose successful effort at proselytism had been so nearly fatal, wept over his beloved pupil as one raised from the dead.

It was a glorious evening, about the middle of November, when the waters of the bay of Lisbon, lying tranquil in the declining sunlight, reflected the form of a British man-of-war that was gliding majestically over its smooth surface. It was the ship that was to convey the Minister's family to England, and which had been anxiously looked for for some days. The day after her arrival she took on board her passengers, among whom were the Marquis of Elvas and Leonora De Castro, disguised as servants. Immediately after they reached the deck the anchor was upheaved, the sails were hoisted, and, with the flag of St. George flying at her peak, the gallant ship bore away for the open sea. Just before the ship reached England the good curate, who was one of the passengers, joined together in the holy state of matrimony John, Marquis of Elvas, and the lovely Leonora De Castro.

EARLY HISTORY OF COLORADO.

NEARLY three hundred years ago the Spaniards who peopled Mexico extended their settlements far to the northward, reaching over New Mexico and Arizona and into what is now Utah and Colorado. Their chief industry was mining for gold and silver, and traces of extensive though rude works, and ruins of large towns, are found all over the region named. The earliest historians of the Great Plains and Rocky Mountains speak of the "Old Spanish Trace" (trail or road) that reached northward through the mountains to Great Salt Lake. Generations ago there were populous Spanish settlements along the Arkansas Valley in Southern Colorado, and their *acequias*—canals for conveying water—can yet be traced along the prairie bottom lands and slopes. The ruins of cities and remains of extensive water-works are yet seen in the exceedingly rich gold and silver bearing region of the Uncompahgre in Southwestern Colorado.

The Spanish, or Mexican, frontier was gradually beaten back by the savages. The territory now covered by Colorado and Arizona was entirely depopulated, and foothold was maintained in New Mexico only along the larger valleys, where population had become very dense and self-supporting. The mines were all abandoned, and the mining frontier driven back to the centre of Chihuahua and Sonora. The farthest point north where any traces of old mining operations have been found is in the mountains northwest of Boulder, not far from the base of Long's Peak. In the winter of 1859 some hunters from Denver found there a number of shafts and the remains of houses. They also brought in a portion of a large copper vessel, not unlike the body of a still. Inquiries made at the time of Arapahoe Indians elicited a tradition that many years ago a party of Portuguese adventurers came north through Mexico and engaged in mining at the point indicated. In course of time they disappeared, and all trace of them was lost. The inference conveyed was that they were killed.

The first reliable history pertaining to the region of Colorado, to which we can now refer, is in 1805, and is in the journal of Captain Zebulon M. Pike, of the United States army. In the spring of 1804 two important expeditions were fitted out at St. Louis—the then frontier military post—for the exploration of the country west and north: that of Lewis and Clarke, who ascended the Missouri and descended the Columbia to its mouth; and Captain Pike's, for the Upper Mississippi. The latter returned in about a year, after having endured great hardships and met with many adventures, and reported that he had traced the great river to its source—an opinion that time has proved erroneous. Upon reaching St. Louis he found a new duty awaiting him: the return of some rescued Indian captives to their tribe—the "Kans;" the mediation of peace be-

tween that tribe and the "Kioways;" and a tour of observation along the Mexican border—the Arkansas River—westward to the mountains. He started late in the spring of 1805, ascended the Missouri to the Osage, and that stream as far as he could with boats. Then striking to the northwest he completed his Indian mission at their villages on the tributaries of the Kansas River. Leaving there he crossed over to the Arkansas and followed up that river to the mountains. Before reaching the present site of Puebla, Captain Pike discovered a lofty snowy mountain, and soon after passing the mouth of the Fontaine-qui-Bouille he went into camp, and, leaving most of his command, set out with eight or ten men to ascend it. He supposed it ten or fifteen miles distant, and started on foot in light marching order and with three days' rations. It was then autumn, and the mountain was covered with snow. After forty or fifty miles' travel, and much suffering from exposure and for want of water, they reached the mountain-foot and began the ascent, thinking their labor now certainly almost at an end; but after struggling for many hours through thick brush and fallen timber, the snow constantly becoming deeper, they at length reached the summit of an open ridge, from which the lofty peak seemed, says the Captain, almost as distant as when they left their camp on the Arkansas days before. Several of his men were badly frozen, and all suffering severely from hunger, that was partially allayed by finding a storm-bound poor old buffalo, which they killed. The snow was from two to three feet deep, and the Captain was obliged, very reluctantly, to give up the ascent of the mountain, and was never any nearer to it. After a rest they retraced their steps to the main camp, having probably been within twelve or fifteen miles of the summit that subsequently and very appropriately took the gallant Captain's name.

The command, about thirty men, then marched up the Arkansas and made a second dépôt camp, where is now Cañon City. The Captain had tired of land marching, and thought if he could only strike Red River he could float easily back to the Mississippi. So he turned all his attention to that search. Again leaving most of his men, he with the remainder set out, curiously enough, toward the northwest, following the route of the present road from Cañon City to the South Park. Reaching the Park he called the first considerable stream he crossed the Platte. A little further on he found another, and supposed it was the Saint Jaun—probably meaning the Spanish San Juan, which rises in Southwestern Colorado and flows into the Colorado of the West. A few miles more and he found another, which he supposed to be a branch of the Yellowstone. In this neighborhood he found signs of large numbers of men and horses, and supposed they were both Indians and Mexicans. He seems to have had some fear of a hostile meeting, and turned off square to the south. Before long he came to a

large stream, and rejoiced in the belief that it was Red River. Turning down it, he soon found himself in the midst of rugged mountains, and the river cutting its way through stupendous cañons. The mountain-sides were frozen and covered with snow, and the river with ice. More men were frost-bitten, and the horses were all disabled and abandoned but one. The party became scattered, but at last all came together again at their old camp at the Arkansas gate of the mountains; and his first dream of Red River was at an end. But the Captain was irrepressible. With such men as were able to travel, he was soon again on the march, this time all afoot, because their animals were used up. Crossing the Arkansas into Mexican territory, he moved up the Wet Mountain Valley straight toward the rugged Sangre-de-Christo range. More than once he was obliged to back out, the snow getting too deep for their strength. Frost-bitten and disabled men were left behind in improvised shelter, with such supplies as could be spared. The journey was one of most intense suffering and hardship; but at last they stood upon the summit, and looked down into the San Luis Park. The Captain rejoiced at the discovery of Red River, though he looked upon the Rio Grande del Norte. Descending, he traversed the plain, and at the confluence of two considerable branches of the stream established a fortified camp. Having completed his works so that himself and two or three men could defend themselves against the Indians, he sent the remainder back to the main camp, and to pick up stragglers.

Meantime the Mexican authorities were not ignorant of the expedition. They looked upon it with suspicion; and all the previous season a squadron of cavalry had been scouting the plains east of the mountains to cut it off, fortunately without success, and entirely unknown to Captain Pike. But a few days after he had got settled down in his new quarters, while walking out one bright winter day, he was surprised by a patrol of Mexican soldiers; and, though it was long before he fully realized the fact, he became from that time forward, for a year or more, a close prisoner. He was hurried to Santa Fé, and subsequently to El Paso, and thence to Chihuahua; his men following the same road, but never again all coming together. In course of time they were returned to the United States through Texas; but most of the Captain's notes, maps, and other valuable papers were never recovered.

While a prisoner in New Mexico, he saw an American who had in his possession lumps of gold that he had gathered in the South Park, on the head waters of the South Platte, and learned that the traces of Mexicans he had found upon the Platte, Saint Jaun, and Yellowstone—as he called them—had connection with the finding of gold in that region. This is the first authentic report of actual gold gathering in what is now Colorado. The next is in 1832 to 1836, after Bent and Vasquez and

Sarpy had established their chain of trading-posts all along the foot of the mountains, on the Arkansas, six miles above where is now Puebla; on the South Platte, at the mouth of Vasquez Fork, six miles below the present site of Denver; and on the North Platte, at Fort Laramie—then Fort St. John. In trading with the Indians and Mexicans who came into Fort Vasquez, they frequently obtained lumps of coarse gold, which had doubtless been picked up in the streams and gulches of the mountains. We come down next to 1849. In that year of the great rush to California many emigrants from the Southwestern States traveled up the Arkansas, thence north along the foot of the mountains, the entire breadth of Colorado, and through the South Pass to the Pacific. They found gold in Cherry Creek, the Platte, and other streams, but kept on toward California. Among the number who made these discoveries was W. Green Russell, a Georgia miner, from the vicinity of Dahlonega. After some years in California, he returned to his old home, still with recollections of the traces of gold he had seen here, and the determination, at some favorable time, to prospect the country. In 1856 a column of troops marching between New Mexico and Utah found gold in Cherry Creek near their camp. Another command passing in 1858 did the same. In the spring of the same year W. Green Russell found himself able to undertake his long-delayed exploration. Leaving Georgia with twenty or thirty followers he reached Cherry Creek, and followed it down to where Denver now stands, in July. A party of Cherokee Indians and half-breeds from the Indian Territory, west of the State of Missouri, came out about the same time, and upon the same errand, but they made no permanent location nor lengthy stay. The Georgians found gold in small quantities all along the Platte, Vasquez Fork, Cherry Creek, and other streams and gulches on the plains, but did not penetrate the mountains at all. The deposits they found were not sufficiently rich to support a large population, nor to pay largely even a few, but they served to stimulate further search and to create an intense excitement throughout the Western States. Several hundred men from the border, Kansas, Nebraska, Iowa, and Missouri, crossed the plains late in the fall of 1858, and spent the winter in and about Denver. Several towns were started, and a great number of log-houses built. Little parties went back to the States, and carried with them samples of the gold found; bright, smooth scales of exceeding fineness. By spring the excitement was at fever heat, and before the snows were over long lines of tented wagons were stringing out from every starting-point along the Missouri River. Early in April the moving column reached the site of Denver, and the arrivals sometimes reached thousands per day. The mines thus far found could give work to but a few hundred, and the best of them yielded scarce more than two dollars per day. Dis-

appointment followed, and almost a panic ensued. Three-fourths of all that came went back, turning about thousands more that they met on the way. The more determined, and those who had nothing to lose and all to gain, or who left nothing behind to go back for, remained.

As soon as the snow disappeared from the lower mountain slopes the more adventurous began pushing into the mountains, cautiously feeling their way. But few of them had ever before seen mountains, and a still less number knew how to search for gold. In the latter part of April gold was found, almost simultaneously, at several points in the mountains; at Gold Hill, eight miles west of Boulder City; at Deadwood, on South Boulder Creek; at Gregory Point, near where Central City now is; and at the junction of Vasquez Fork and Cook (now Chicago) Creek, near the present beautiful town of Idaho. The first heavy rush was to the latter point, but the tide soon turned toward Gregory. For days in succession the arrivals there exceeded three thousand per day. Exceedingly rich mines were found, and gold was gathered rapidly. Other discoveries followed, and the season was a succession of excitements and "stampedes" to each new point of attraction. With the approach of winter most people left the mountains, and a large majority returned to the States. The few who remained in the mines provided themselves with provisions for the winter, and prepared for months of isolation. It was expected that snow would fall to a great depth and the cold be very severe. In this they were disappointed.

The nearest post-office in the first settlement of Denver was at Fort Laramie, two hundred and twenty miles distant, and it cost half a dollar to send or receive a letter. On the 7th of May, 1859, the first express coach arrived, and the cost for transmitting letters was reduced to twenty-five cents. It was not until the spring of 1860 that a United States mail and post-offices at Denver and Mountain City were established, nearly two years after the first settlement of the country.

TWO HEARTS.

I.

PERHAPS in the little town of Warehurst the lives of no people presented a more vivid contrast than those of the heiress Jessie Warehurst and of the young seamstress known as Emeline—for one of these lives might verily seem nothing but the black shadow cast by the other in full sunshine.

The one of these people was the child of a family that gave their name to the village a hundred years ago, and had always maintained their traditional superiority to other families in the place by means of a style of living that was little short of splendor in that secluded region, by their lofty acquaintance in the outside world, and by their constant charities—charities, how-

ever, of a kind into which money freely enters and personal contact stays without.

Jessie, the last of her name, and the inheritor of a handsome fortune, lived with her aunt and mother, the latter a gentle and placid woman, and Jessie's adoring slave, in the old and spacious mansion, the dark halls and drawing-rooms and sunny morning-parlors of which a troop of young guests kept overrunning with merriment. She was but a year or two escaped from the dominion of schools and governesses, a thralldom that had never been severe; she enjoyed every luxury that the little world of Warehurst knew about; her dress was sumptuous; the ponies of her phaeton were as fleet as Arabs; she was the pet and admiration and delight of all who knew her—the unspoiled mistress, as it seemed, of all who came within her magic sphere; her life was an unbroken scene of festivity, and she was light-hearted, innocent, and joyous with the whole inspiration of the spirit of youth. They used to say that her name was given her because she was as sweet and white and spotless as the jessamine itself; kind to all who met her, for vice instinctively kept out of her way; a sunbeam in the path of poor and rich; and utterly unsoiled by sin, so far as any creature knew.

Emeline, on the other hand, had known poverty from her birth; she was but Jessie's age, yet her life had traveled a stretch of sin and wretchedness and repentance before which the other would have recoiled could she have seen so much as the first footprints and have understood their meaning, people said. She had been born in the alms-house, and knew the bitterness of such birth; ambitiously she had learned to read and to write; and as soon as it was found that she knew how to sew, and had, moreover, a certain genius of the needle, so to speak, she was kept constantly at work, leaving the place at last when still scarcely more than a child, and being bound out in the position of seamstress in a wealthy family of the city. Working there in her mistress's sewing-room, or going and coming on errands in hall or parlors, her dark young face, not without a gipsyish comeliness of its own, had been so unfortunate as to attract the gaze of a guest of the house, one who admired after his way the gloss of her black hair, the carnation of her cheek, the lustre of her eye, the curve of her lip. She gave him the whole passion of her young life and heart; he gave her, at sixteen years, ruin and betrayal and the world's scorn. Then there came a season of desperation—a season too dark for Emeline to remember. She would not remember it, and could only maintain to herself in after years that it was another person, not Emeline, who had suffered that. But out of its foulness she rose one night, when, seeing a face flash like an apparition out of the night, as Jessie Warehurst, visiting the great city, crossed the pavement from door to coach—a face all white and radiant and perfect, its golden hair a nimbus of glory round about it, its beauty

something heavenly. The face smiled on Emeline without seeing her in the shadow, a deep, sweet smile, searching as sunshine cast off from happy thoughts. It seemed to Emeline then that all was not lost while such a smile as that could be shed upon her, could be in the world, and she allowed to see it; and all at once the brilliancy of face and smile together lighted up like morning the black gulf between the two, and made it more odious and reeking to Emeline than words can say. A few weeks or a few months later, whichever it may have been, Emeline went back to Warehurst, and hired a room and put out a modest sign expressing a desire to obtain fine sewing to do; and curiosity, and remembrance of old marvels of her needle shown at the county fairs, having tempted one and another to examine her capacity, she soon had work enough and to spare, and hired a better room and enlarged her fare of crackers and cold water to a more healthy diet, and changed her tallow dip for kerosene. But she made no secret of what her way of life had been; she knew, perhaps, that rumor of it would travel on the wings of the wind; she felt that it would be worse torture to live with a sword suspended over her head than to meet and live down the open shame. But she wasted no words on the matter; and so, when they asked her where she had gone when deserting her apprenticeship, she answered, briefly, "To the bad," and was silent for the rest. Her existence was wan and overcast—laborious, solitary; there was not a soul in the world to whom she was dear, or who was dear to her, not a soul who cared whether she lived or died; and her heart, a wild and stormy heart, ached with its loneliness. The people employed her because her fingers were deft and dainty; but they spoke of her among themselves as a thing that had known shame, and might know it again; that was not to be trusted with companionship, lest the trust should be abused; a smile on her lip would have been construed a sign of levity and lapse into fresh sin—and Emeline never smiled, but lived from year to year ostracized, sad, and dark with a cloud of hovering suspicions.

Lovers came and went round Jessie—some enraptured with her loveliness, some with her temperament, some with her riches—but among them not the right one; and, smiling coldly on them all, they passed before her like ephemera. And so her years went by, till presently they were numbering twenty-two—twenty-two, which leaves an innocent and isolated country girl still very young. Emeline, also, was twenty-two; yet her years left her not young, but old, and on none of them could she look back and endure the glance, save the last four since her return to Warehurst; for the want and misery of the alms-house was sore, but sorer yet was that sudden burst of love and rapture which the shame and the desertion following made it only torment to recall; and that, in turn, was darkened by shadows rising from that abyss of horror into which it plunged her. The first bright

thing in all those years on which her remembrance could dwell was Jessie Warehurst's face shining on her, as she stepped along the carpeted pavement, and let the whiteness of that smile overlay, for a moment, all her smirch and soil. Since then, four dull, monotonous years—weary return of spring, and blaze of summer, melancholy falling of the leaf, weary, dreary chill of winter—and the only happiness in them all was such time as the face of Jessie Warehurst had again illumined the way, and given her anew that thrill of hope which once had told her she was a living soul, and not mere carrion, and had made Jessie Warehurst a type to her of the spirits that stand before God. She had never spoken with her; she worshiped her as the publican and sinner worshiped, standing afar off. She was as full of thankfulness to her for rescue from that slough in which she wallowed as if Jessie had consciously put out her white hand and helped her thence; and there was no sacrifice in life or death which Emeline would not have made for her—indeed, hardly any sacrifice could there have been for her to make, since life held not a single charm for Emeline, except the trust of ending it at last. But of all this feeling on the other's part Jessie was totally unconscious, and neither she nor any other earthly being offered the girl one incentive to virtue; of herself, and simply, she had sickened of sin.

Emeline was happiest—if happiness could ever be a condition of such a darkened life as hers—when employed on sewing for the family at the Great House, as the people of the village, in a mild derision, sometimes called the Warehurst mansion. On whatever she had to do for Jessie, or her mother, or her friends—who sometimes sent their work down from town to this fabulous seamstress—she expended her whole skill and invention. The plain sewing was done with a precision which counted every thread to the stitch; tucking, and ruffling, and inserting, she combined in every sort of quaint device, till each decorated garment was as perfect in its way as a quilled daisy; and on the embroidery she lavished her hours, her eyesight, and her fancy, with flowers and ferns and vines running riot over the fine fabrics, like the wintry wraith of blossoming to come.

When, then, Emeline heard that one of the lovers had at last broken the hedge round that sleeping heart, and that Jessie was to be married, her own heart beat with a sort of pleasure; not for the young girl, her hopes, or her future—with that she felt she had nothing whatever to do, and she kept her dreams away, as if angels with flaming swords barred that Eden; her heart beat with only a poor and personal pleasure, in expectation of the sewing she would have to do in assisting to prepare the wedding garments, of the way in which she would weave petal and stem and leaf in the embroidery there, in imagining herself already tracing new complications and intricacies of lace stitch and satin stitch, in counting the errands that might take her to the Great House, and give her new guises

of that face shining out of its cloud of happiness—that face which once had been a revelation of heaven to her in hell. She did not dream of herself as unfit to work upon these garments: sorrow and grief and shame had purified those hands of hers. Humbly as she walked now, she had planted her feet on heights where martyrs had walked before her; and though she made no outward profession of religion—fearing it would be but scoffed at as hypocrisy—yet she felt forever wrapped about her, as if she might not fall away from them, the clasp of forgiving and eternal arms.

But when Emeline learned that she was to go in person to the Warehursts and remain with them all through the ordeal of the wardrobe, she could hardly believe herself. Not only to see Jessie every day, but to be herself among the influences that had made Jessie what she was, it seemed in the anticipation too much bliss for her poor cup of broken delf to hold; in the realization, perhaps, she may have found it a less intoxicating draught. The bridal dresses, she was told, were to be fitted in the city; but Emeline's own fingers were to finish them all, and the delicate under-clothing's last touches were to be given by no one but herself. An artist receiving orders to decorate a temple was never in more ecstasy at serving the ideal than Emeline.

Many a good gossip of the little burgh remonstrated with Mrs. Warehurst for her imprudence in introducing among the members of her household a person of Emeline's acknowledged antecedents, a person who made no secret of having led an evil life; and though Mrs. Warehurst responded that it would be impossible that any harm should come of it, for the seamstress would have no opportunity of communication either with Jessie or any of her friends, except she herself or her sister, a staid and starched piece of prim propriety, were present in the flesh, and that she felt it wrong not to encourage one who was trying to do right, yet the others responded in effect that, for all that, a foul heart must emit a mephitic moral atmosphere that was poisonous, and though they themselves encouraged Emeline by giving her employment in her room as convicts in their solitary cells do work, yet her presence and her touch must be only contaminating to youth and innocence; in spite of which counsels Mrs. Warehurst had her own way, possibly because her nature was superior to theirs, but still more possibly because no one else could do the things that Emeline could on work which she desired to have under her own daily inspection.

So Emeline went to the Great House, and, sitting at her work-table and her window there, she stitched and wrought the hours away from morning to night, seldom moving from her seat, seldom glancing up when addressed, only now and then satisfying her eyes with one long unheeded look at the happy Jessie, delaying over one matter or another in her flitting from room to room—only now and then, as if she feared to

gaze too often lest she were dazzled with the sight.

It might have been a pathetic thing to any one who knew of the girl's life, to see her sitting there so silently, so patiently, and so contentedly, toiling to bring about a happiness in which she could have no part, the like of which she could never know—an outcast looking into heaven, but without one pang of envy or of longing for the bliss within. All that, indeed, was forever denied to her—she never gave it a thought; even when sitting there and seeing Jessie wandering through the gardens surrounded by troops of friends, beloved by a lover who was presently to give her his name before the world, watched by a mother with a tender affection following every footstep, surrounded by the sunshine of this world's favor and the halo of the next world's promises, it did not occur to Emeline that of all these things, friends, lover, good name, and home-affection, she herself was destitute—that she was deserted, desolate, and alone. She had trained herself to become as impersonal as a shadow. These were the things natural to Jessie as the perfume to a rose; hers were the things natural to her as the deadly juice to the night-shade; only sometimes as she heard the chorus of cheery laughter rising to her window from the flower-beds below, and caught glimpses of the airy draperies, bright as the flowers themselves, fluttering from alley to alley, of the sunny smiling faces, then a great hollow ache seemed to pervade her being, a sense of void and empty existence, which she did not construe into longing for any thing to love, but merely into acknowledgment that she was of a different race from these careless and innocent ones—she, born in an alms-house, bred to labor, abandoned to sin, and with but one blessing in all her life to thank Heaven for—that she had been snatched out of that sin.

Emeline, of course, asked no questions, and had heard nothing of Jessie's chosen husband. It was one of the things she took for granted, that he must be perfection, or, in the eternal fitness of things, he would not be chosen. Once, indeed, she chanced to hear his name, and started—but not because that same name had brought ill to her: many men might wear that name. The thought crossed her mind no more than any other utter impossibility that this man Devlin could be the same Devlin with whom she once had fled, or, rather, to meet whom she had fled, from white and open life into the darkness where he left her. One day, at length, she heard that he had come; and at sunset, as she folded up her fine work to take out that needing less dainty stitches, Emeline paused a moment, resting her arm on the window-sill, and leaning out to enjoy the hush, the dying color, the smell of the dewy mould, the rapture of that hour when heaven and earth are meeting, and she saw Jessie and her lover walking in the garden. A sudden pain struck Emeline like a stab as she beheld that shape—the old-

remembered guise, the gracious bending way, the turn of head, the false fair face—and with a low and smothered cry, that it was profanation for him to breathe beside her, she dropped upon the floor, and there, shortly afterward, Mrs. Warehurst found her. “I must go home!” sobbed Emeline, as they laid her on the bed. “I must go home. This is no place for me.”

“My poor girl,” said Mrs. Warehurst, “you have been sewing too steadily. Instead of going home, you must take a little exercise in the grounds, you must drive down to the village on the shopping errands, and have wine sent up with your dinner” (for Emeline’s dinner was always sent up to her, since it would have been insulting to ask housekeeper or servants to sit at the table with such a creature as that); “but, indeed,” added Mrs. Warehurst, “you must not go home; for here is the work to be done, and no one in the world but you to do it.”

So all night long Emeline lay there, with remembrance of the old passion and the old misery fighting the old fight over again in her heart till the hot battle-place seemed bursting. Not the old passion, she said, since thought of the man was pain—only a remembrance of it; oh! not the old passion, but the old misery indeed, and a new one almost as keen: a misery that grew and doubled itself as she recognized it; for—was it possible—that she, a wretch, an outcast, was jealous of Jessie Warehurst? And if jealous, then it must be—could it be?—that she still loved the man. Her very soul was lacerated by all these pangs of doubt and fear and memory. It was only when the first faint purple flush of day began to filter through the deep and dewy dark, and the stillness of the prime was broken by a fluting bird’s note and another, till the heavens were overflowing with tune, and morning was ushering in another joyous day for so many, another burdened and tormenting one for so many more, that Emeline imprisoned all her wild emotions beneath the strong bars of the last four years’ habits again. It was true, she confessed, that she still loved Devlin. She had thought the fire burned out, and so it was; this love was but the white ashes of that old one scattered over all her life, and making the bitter lees of every cup she drank. She loved him. Helpless to serve him, there was but one thing she could do for him: suffer him, without a word, to make Jessie his own—him, of the earth earthy, to desecrate a shrine. Doubtless he was the same Devlin still; the same winning, insinuating, captivating manner; the same false, worthless heart; the same self-indulgent voluptuary, weak before temptation, cowardly before exposure. With all that, she loved him yet—loved a strange wraith in him, not him; a vacuum; an identity, not his, but that of the qualities and traits which he had not—loved what she had once believed him to be, and never could dissociate from him—loved him so that, after that first tumult, she could surrender him to another woman without a murmur (though no murmur of hers might

avail to hinder)—loved him so that she could give him this girl, her ideal, to help him, to purify him, to make him worthy of heaven hereafter through having tasted something of heaven here with her; a heaven in which Emeline must be all forgotten, a wretched stain forever washed away. For it might not be that he could serve the wealthy ward of powerful friends as he had served a poor sewing-girl, nor even that he should wish it. Jessie, that winged soul, could be to him what the untaught, groveling Emeline could never dream of; and as he could love, plainly he loved her now; and she would open depths in his nature that had always slumbered darkly. This, then, was the service she could render Devlin, the sacrifice she could make for Jessie; no sacrifice, in fact, since Devlin was none of hers; but, in Emeline’s bleeding heart, a willing sacrifice of more than life; and there shone on her face that day a lustre as if thrown from the wings of a dove forever flying upward into the light.

But at sunset, once more, as she saw the two walking in the garden again—arms interlaced, heads bent together, one breath, one smile, one word—fresh queries, fresh counsels, came to Emeline. So that gracious head had bent to her; so, doubtless, to others. Might Jessie be the last? Was she, after all, so sure that he loved Jessie with all the strength he had for loving? Was it just for her to keep silent, to hazard Jessie’s welfare on the chance, to try the doubtful venture if there were power enough in that young girl’s clean hands to hold him and help him and save him at last, when a brief word, a swiftly told story, and Mrs. Warehurst would put an end to all, nor suffer her daughter’s life-long happiness to encounter the risk of wreck among such shallows and quicksands? Emeline was too weary to lie awake a second night with her trouble; it only came to her in disjointed and fearful dreams, and woke with her, and kept with her all day, and day after day. Which was her duty—to be quiet, or to tell her tale and let the responsibility leave her own shoulders for others? If she were going to tell it at all, it should be quickly—ere the preparations reached such a height that mortified pride might mildew any harvest of the truth. Which was her duty—to tell her tale and rescue Jessie from possible injury, or to hold her peace and let Devlin’s good angels, if he had any, work with his wife for his salvation? Emeline could not decide—at one moment the marriage seemed a mockery and a sacrilege to Jessie, at another its prevention seemed eternal ruin to Devlin.

And thus the trouble drifted in Emeline’s mind, only slowly and more slowly, and always painfully, setting toward the fact that the truth must be told, and the consequences left in the hands of God; that it would not do for Jessie that things should take their course; that she should marry Devlin at the cost of certain sorrow to herself, at the mere chance of bettering him—it was like sacrificing an angel on an

earthly altar. And yet, was sorrow the worst thing in the world? had she not heard that it was better to be plowed with a harrow than to remain a hard, unbroken clod? Was the good in this life not born of sorrow? Sorrow, of some kind, must she not know, being mortal? and was this worse than another? Might she not, marrying him, lead him upward so insensibly that she would never discern the evil in him? But, on the other hand, in the children of future years the stains of a father's nature must be brought to light; and there might be a bitterer sorrow to be borne than all the rest. Whether it were want of courage to speak with Mrs. Warehurst, want of will to do it, or want of power to arrive at a decision, Emeline still waited, and stitched, and looked about her in the intervals, taking observations from a new point of view; for suddenly some gleam of light, or else some inspiration—the shock, perhaps, felt on finding that Jessie had no instinct of truth able, like Ithuriel's spear, to detect the evil thing—had made it seem worth while to test this maiden, of whom she had imagined so much, to be sure that she was altogether lovely to the core, and not a mere outside of beauty only unflecked because no wasp had ever touched it. Before she abandoned Devlin to the lonely fate to which he had once abandoned her, she would see if Jessie were so utterly unfit for him by reason of ascribed perfection, or if she were not omnipotent enough in that perfection to encounter every chance successfully. Providence must help her to some clew to it all—and she prayed and waited.

Sometimes, when the prim and proper aunt was in the sewing-room, the young girls who visited in the house came and sat down there, and handled the pretty garments, and took a needle for a little while themselves. Emeline liked to have them; it was like being outdoors among the flowers and birds and bees when this parcel of gay, glad things laughed and chirped and chattered among the frills and laces. Emeline never remembered then that she was a young thing too; she was not, she was a mature and weary woman, and they were beings of another world than hers. They were too innocuous and merry—perhaps, indeed, too good-natured—ever to taunt Emeline, in any shadowy manner, of what was past with her, ever to worry her with questions, much as they might wonder at the silent and mysterious thing plying her needle from dawn till dark, and concerning whose history doubtless each one of them knew all that had ever been told; but many a heedless word of theirs cut Emeline to the quick. And something that pained Emeline more than any words that could be said was to catch sight of the clew to which Providence was helping her, and to find that Jessie, this radiant creature whose whiteness had once pointed a contrast with her own vileness, and ever since had done the same, whose beauty was so dazzling that it made an aureole of holiness about her to the beholder's eye, might, aft-

er all, be only like that fair-skinned fruit which is at the heart nothing but a pinch of dust. Possibly less frivolous than the others—possibly not more kind-hearted, but better bred—yet it was not good for one who had followed her with a sort of adoration to see now the trifling pleasure that she took in these wedding garments; to see that she was not entering marriage as a sacrament of great mysteries with the Creator, as a state of lofty emotion and sacred experience, but as a career of freedom and pleasure and fine clothes. A young girl, for instance, was allowed no such toilets as these the bride should wear, nor such jewels shedding light as if from inner sources of flame. She arrayed herself in them, and turned and twisted before the glass like any common school-girl, and rubbed the bloom off herself in Emeline's fancy so much that Emeline could see that it would not have been of the slightest consequence to her if she had known she did.

Yet, she was assuredly a beautiful thing, in that shimmer of satin, that frost of lace, and all the glow of the great white-hearted diamonds around her throat and in her hair, standing there and smiling at the enchanting vision in the glass that smiled back at her. So Devlin thought, most likely, at first glance, being beckoned into the room by Mrs. Warehurst, after a hasty word of preparation to the rest, and stealing up to slip an arm about her; when suddenly his eye caught that of Emeline's—Emeline stiffened, if not prepared, by Mrs. Warehurst's exclamation; but dark and pale, and her heart almost ceasing to beat—and at the sight of this death's-head at his feast, startled into gazing a moment, then he shuddered out of the room without a word; while Jessie, seeing his reflection in the glass, and forgetful of her frippery and all else, flew after him in a terror, lest sudden illness had overtaken him—leaving Emeline to regain unheeded the composure she had lost, but no one had missed.

When Emeline, in the dead of the night, thought of that scene, it argued to her that Devlin had not yet lost all sensibility—that, therefore, he was not past saving. That in Jessie, even were she stripped of all the impossible perfections with which her own diseased imagination had once gilded her, there was yet enough to lift him to a level he had never trodden—and it might be that no such sacrifice as she had dreaded was involved.

It was three weeks yet before the wedding; and the sewing was all done. That was Emeline's device; in her idolatry, when first going to the house, she determined that there should be a season, ere the wedding, when gauds and gewgaws should be out of sight and out of mind, and other better things should have their day; she had thought then that that would be a pleasant thing to Jessie; afterward she meant to have it so perforce; and she had risen in the night, unknown, and finished many a piece of work, to have her way. On the morrow now, she would go back, out of the splendor and the

bustle, to her lonely, dreary room—lonelier and drearier it seemed to her now than ever. If she were going to tell Mrs. Warehurst the secret she had to tell, she must speak to-night or else be silent for all the future: in the three weeks yet to come it was unlikely that there would ever be a better chance than at the moment when Mrs. Warehurst sent for her to the drawing-room, to pay her at her desk there, for her months of work, and take her receipt for the same.

It was a tempestuous evening, with one of the fierce and sudden September gales of the region, working havoc in the gardens, lashing the branches against the casements, and howling round the house like an army of angry spirits, before which all flesh was powerless—a shivering night that made one think of malignant things abroad and at their work.

A gay group of the girls, whose numbers were always full with fresh arrivals, was in the great front drawing-room, clustered round the hearth on which, more for cheer than warmth, a handful of pine knots had been kindled, and was now sending fitful flashes to dance about the alcoves and ceilings, and in among the heavy pieces of dark and polished furniture, a century old. They were telling each other such ghost stories as they happened to remember, or were able to invent, and had wrought their blood into a curdling condition before Devlin and Frank Warehurst, Jessie's cousin, came in from the billiard-room.

Mrs. Warehurst had sent for Emeline to come down to the back drawing-room, which was, in fact, that rather methodical lady's peculiar apartment for the transaction of any business; a silken screen—the dim lamp lighting the desk, but no more—partially obscuring them, while none of the laughing tribe in the other room gave a thought or glance in that direction as Emeline wrote her signature, and took the money which Mrs. Warehurst handed her, and was folding it up before she realized that it was five times the stipulated amount, and was a sum to be laid away for a bulwark against the want of any dark day. Then she suddenly turned with wide, wet eyes, flushed cheeks, and parted lips. "No, no, my child," said Mrs. Warehurst, gently; "it is quite right. I want my daughter's marriage to be an occasion for you to remember. If you put this sum at interest, some day it will buy you a little cottage. No, indeed, you must not thank me any more," as Emeline's quivering lips opened again; "you have earned it; the work could not have been bought for the sum—"

"Oh," said Emeline, "how kind you are to me! You are kind to every one! I never knew what a mother can be till I saw you with her! And she deserves it—so good—so lovely—"

"Yes," said Mrs. Warehurst, warming a little at these natural expressions of emotion from the girl whose hand her pure and haughty blood could never let her bring herself to touch;

"my child is all the world to me. An only child is apt to be. See!" said she, with a sudden impulse. "Here is a handkerchief of hers, and it shall be yours for a keepsake." She paused then, regretting her words, and yet the little shred of lace and linen might be a talisman some day to keep the girl from a temptation, and she put it into her hands.

"How kind you are!" repeated Emeline, dissolving in tears; "and I must pay you so poorly." And she bent to kiss the fingers; but they had been withdrawn—for those were not the lips to press Mrs. Warehurst's white hand; and just then there came a peal on the hall bell that rang through the rooms, and rattled in the rafters, followed by a blast of the tempest, shaking the very house, and making the chimneys groan. There was a shriek, of course, from the giddy girls about the hearth in the other room, and a burst of laughter, and then listening, followed by a patter of questions and wonderment, till the door opened, and old John appeared, holding in his arms a parcel, which he set upon the table, having first spread a paper beneath, for the parcel was wet with the rain.

"Indeed, miss," said he, "when I answered that fireman's peal there was no one at the door at all, and nothing but this bundle, dripping with the wet."

"The express man," said Frank; "of course he didn't wait in the rain."

"Another wedding present, Jessie!" cried the chorus.

"I suppose so," said Jessie, eagerly. "Bring some scissors, John, please. Oh, thank you!" as the old servant, with his jack-knife, ripped up the slight covering, stretched tent-wise across an open wicker basket, and then started back in dismay to see the injury his knife might have done, while taking with him a sheet of cotton-wool, and disclosing another one beneath, where lay a little, rosy, sleeping baby.

With the cry of surprise and anger that came from Jessie Warehurst's lips—unmistakable anger, whether that of disappointment, or bewilderment, or of interpretation of the affair as an insult to her house and name—the child opened its eyes, not as some children wake, in terror and tears, but with a smile that might have melted any one's heart, and lifting both its little, dimpled, naked arms toward her. Certainly it touched Jessie, in the midst of her anger; for the water sprang to her eyes, partly in pity, and partly in a vague, wild fear. "The poor thing!" she exclaimed; "the poor thing! Deserted by its dreadful parents—a little bunch of sin. Oh, how can people be so bad!" And she hid her face in her hands to shut out the sight of it.

"What is it? Pray what is all this?" asked Mrs. Warehurst, hastening to the scene of outcries and exclamations, from which the young girls were retreating, in a huddle, to the fireplace, and Jessie with them.

"Left at the door, ma'am—a foundling," said John, respectfully. "Some love-child that

its mother seeks a good home for, and drops it on your door-stone, and pulls the bell, and runs;" adding his mite of pleading for the little object whose helplessness already touched his old affections.

Mrs. Warehurst bent over the basket—a new one, that might have been purchased at any corner store—seeking something by which to trace or identify the child, cooing and gurgling to itself, before disturbing it; but there were no words, no clothing, and absolutely nothing there, save the strip of new cloth that had covered the basket, and the cotton-wool.

"Poor little dear!" said Mrs. Warehurst, as the child grasped her finger; "I suppose it has no right in the world; a poor little wretch with shame for its birth-right"—saying, perhaps, more than she would have said just there if Emeline had not been at hand to profit by the occasion.

Jessie was trembling in every limb, as she stood holding on the mantle-shelf, by Devlin's side. "Oh, we never came so near such evil before!" she cried.

"It is nothing but the consequence of having Emeline here sewing," said the aunt, ignorant or regardless who heard her in the next room; "the people think if we forgive one, we will another."

"Oh, mamma!" cried Jessie; "it makes the house dark; it seems to fill it full of wickedness and horror. It makes me creep; it makes me feel as if there were a great crime among us! Oh, send the loathsome little thing away!"

"Certainly," said the aunt, beginning to bustle about; "no one would dream of any thing else. Certainly; we shall dispatch it to the alms-house directly!"

"Why," murmured Mrs. Warehurst, "I hardly—hardly like to do so; for—it is such a pretty baby—and it seems as though it had been sent here—"

"By sinful wretches!" exclaimed her sister.

"And I'm sure John's wife would be glad—"

"Indeed she would, ma'am," answered John.

"Mamma!" ejaculated Jessie, perfectly white and faint, and forgetting that Devlin or any others were in the room, for the instant. "You won't think of keeping it? You can't! It would drive me wild! I should feel it always like something unclean in the house—I should shudder every time I heard it cry! Every time I saw it it would make me remember all the sin and sorrow in the world—would make me feel as though I were a part of it!"

"Be quiet, Jessie," said her mother, gently. "This is nothing to excite you so—a helpless baby."

"But it turns me sick with the disgust of it! It makes me afraid! Oh, I can not endure it! Don't you see how I am shaking? I don't know why. You must send the poor miserable thing away—you must, mamma!" And she was flinging herself out of Devlin's arms, and rocking to and fro on the ottoman in the recess, in an hysterical of sobs and tears.

"Of course, of course, my child," Mrs. Warehurst hastened to say—"if you will be still—of course. John shall put the filly in at once. Never mind the storm, John; the poor-house is only a mile away; and I have no doubt they will take the proper care—" She paused in a horror of astonishment, as Devlin swiftly drew Jessie further into the shadow of the great chimney-jamb—*not* seeing Devlin, but only Emeline, who glided down the room, and lifted the child and threw her apron round it; while it commenced, with the strength of its six months, to jump and crow in her arms.

For, standing alone in the dim obscurity of the unlighted room, listening, wondering, while the scene went on before her, Emeline had remembered that, five minutes since, Mrs. Warehurst said her child was all the world to her; and the thought had leaped into Emeline's mind, like sudden sunshine into gloom, that this child, rejected by the rest, might possibly be all the world to her, might be something to live for, to work for, to love—to love, and to love her back again. And all at once, in a tumult of fear, lest being abandoned to the town authorities it should pass beyond her reach forever, she found herself able to enter that room where Devlin was, to pass him, to be untouched by his nearness, to forget even that that dark and slender shape trembling in the dusk was his, and that he had ever been more to her than any passing shadow. "No, Mrs. Warehurst," said Emeline, in her clear low voice. "I was a child in that alms-house myself. This one can not go there while my hands have strength to work for him. If you can not take him, I will. God made you give me, a little while ago, the means to make it easier. I can teach this little child to care for me—there is no one in all the world who does. I shall have some one to love me, some one to love me!" said Emeline, with a glowing face, as beautiful that moment as a saint's. "God gives it to me!" said she. "A sign, a seal of his forgiveness—because I have suffered so!" and loving him already she hid her face against the little child, who seized her hair in both his tiny fists and laughed and leaped in pleasure at the warmth and the caress.

No one else spoke for a moment. Jessie could hear Devlin's heart plunging with a slow heavy stroke, as he stooped over her in the dark recess; if she thought of it at all, it was only to consider it a mark of sympathy with her own distress, never to imagine the burden of remorse, the fear of detection, the agitation at confronting the ghost of an old unbridled passion, with which it labored so.

"Emeline," said Mrs. Warehurst, driven behind the breast-works of her severity perhaps by an assaulting conscience, "I can not expect you to shrink from contact with such things, as my daughter does."

"I used to think your daughter perfect too, Mrs. Warehurst," said Emeline, pausing on her way, and her back turned to all the oth-

ers. "But if she had been she would have seized the chance to save this child from the sin there is always in the world, and not have left it to such as I to do. She is so perfect to look at, I should have liked to think her too perfect to imagine evil so clearly. She did me once so great a service—so great a service—though she never knew it, that I thank her with my whole soul, and I pray that her heart may soften before little children of her own shall come to find it so hard a place!" And with her eyes open at last to see that water finds its level, and Jessie was equal to her fate, and that not a word from her concerning Devlin was needed, and scarcely any longer aware even of the presence of the man in person, while her heart was warm and bubbling with joy and thankfulness, she passed quietly from the room.

"It is only her natural instincts," said the aunt, complacently, recovering from her amazement before the door had closed behind Emeline. "How can she recoil from the neighborhood of evil the way our Jessie does?"

"It is the difference between the two hearts!" said Mrs. Warehurst.

And for my part, I think it was.

II.

And so, half a dozen years later, Jessie Devlin, sitting in sackcloth and ashes, had come to think for herself—had come to think through a process like the disintegration of a flint, were the flint but sentient, a process turning all her substance to the enrichment of the region round her; and, in coming to think that thing, perhaps the difference between the two hearts had lessened, so that any vivid emotion might make them part and parcel with each other.

There had been children born to Devlin's wife in those half-dozen years—two of them. She had not desired the first; she had not welcomed it; life was pleasant enough to Jessie in that first year of her marriage, adored and adoring, without bringing into it a burden for every moment of the day and night, a burden that must rob her of many an hour with Devlin, many a stroll and ride, of half her gayeties of opera and ball and the wonderful new city life, that must cling and never leave her thoughts elastic and free again. She did not care greatly for the child till she saw that Devlin did, and till, with the touches of its own little hands upon her breast, it groped its way into that hard heart, and began to soften it through the sunshine of its presence there; and after that she did not know how she had loved the child—selfishly, indeed, and as a part of herself, but still tenderly—till it lay dead and cold before her before half of its first year had closed. As if in answer to the yearning grief that implored for the pressure of those little arms again, her other baby came—longed for and prayed for, ere its birth, so keenly that Jessie understood what before had seemed mere jargon when one had said there was no music in the world, to any

mother's ears, like that first cry with which a little being wails its way into the world.

Many a time after Jessie had laid her first-born under the sod did remembrance of that stormy September night before her bridal recur to her; and the sight of the laughing, dimpled baby that she would have sent out into the storm but for Emeline rose like an accusing angel, denouncing her merciless nature. Every day she meant to send and see about that child; but every day brought other things to fill her time and thoughts.

For they were days, by that time, that her husband did not make any brighter for Jessie—since Devlin was but fulfilling the promise of his youth—by no means curtailing his pleasures because his wife could no longer share them, but merely, being at liberty in that regard at last, changing their character to one that she could not at any time have shared. He used to say that his wife was so innocent as to be incapable of pity or forgiveness, he had discovered; so good as to be inhuman; and, for his part, he loved the society of his kind. So he sought that society, and kept it, and days and nights were often solitary and sad stretches of suffering to Jessie.

But in all her amazement and grieving over this she found a species of compensation in her child, a splendid, violet-eyed cherub, full of life and love and laughter—the image of his father, perhaps, before temptation had tainted him. She relied on him some day to bring back that father to the holiness of home, thinking, in her unsuspicion, that Devlin had always been before marriage what he seemed in that first year of it, ignorant that he was but returning to his wallow. Always with that end in view, she became wrapped in the boy, her little apostle, who had such work to do! Her very breath seemed to hang on his, she trembled or reposed as the color came or went in his cheeks; and if the possibility that she might lose him flashed across her it made the whole world seem a dark and cruel place, full of evil and oppression against which she was powerless. Often when she bent over his crib at night, and kissed the great, rosy limbs he had thrust out from his laced and silken coverlets, she thought of Emeline and the child she had taken to illuminate her wretched home with love, and desired then to see her and assist her and confess her own fault. But she had not been at home since the second year of her marriage; for the little burgh of Warehurst had now no attractions for Devlin, and Jessie would not go alone, since, in the battle waged against her, she was not willing to give her enemy the advantage of her absence from the scene. When her mother went home from her visits, though—visits growing less frequent as Jessie's need of them grew more bitter, since, for all her need, she would not expose to any the dark places of her life—she had sent Emeline sewing and gifts and good wishes; and year by year, receiving these, Emeline understood them, and felt that nature had been work-

ing with Jessie sternly but to fair ends, and found all her old idolatry returning on her.

One day this boy of Jessie's, who could toddle round alone now, ran into the dining-room where his father sat, his mother having been some time before dismissed from table, according to a foreign fashion aped by Devlin. No one ever knew all that happened there. Whether the boy teased the father or disobeyed him, whether it were in a fit that he fell, or at a blow—whatever it was, if it was the latter it was not Devlin but absinthe that struck the child—and Jessie, hearing the fall, and darting to the spot, carried out a little form that, insensible from concussion of the brain, left her arms only for the final casket. Within the twelvemonth she became a widow: her heart was as empty as her arms, and her life desolate.

"You were too good for me, Jessie," said Devlin, dying. "God would not let you be dragged down to my level; perhaps I shall be fitter in some future—" And grown to be content now with small things, the few words solaced Jessie for much she had endured, and made a long existence less dreary than it would have been without them; for they seemed to her signs of the knowledge of better things than he had followed, and she believed that God would give him to her, purified and stronger, in another world. She had rather he were dead than living the life he had been leading; she had rather her children lay beside him than grow to develop the germs that a father's sins might have implanted, that a mother's aid might have given them no strength to destroy. "I had a hard and selfish heart. I had no right to bring children into the world to inherit such an evil. I do not know how far it helped in the ruin of my husband," she said. But, for all that, the heart agonized after children and husband—no longer hard, since it could mourn so; no longer selfish, since for its own satisfaction it desired back nothing that had been taken away.

Jessie still kept her home in the city, in the lofty and spacious mansion, peopled only by ghosts, and where her silent footfalls echoed behind her, so great was the hush, for there was a sort of fascination to her in the scene of all her troubles. Troubles or not, it was there, she thought, that she had really begun to live, that she had broken through the splendid shell of her youth, and entered into the mutual life of all creation. She read the fable of Undine with a new comprehension: to her also marriage had given a soul. But the loneliness of the house was something appalling—appalling in the night when she woke out of dreams with her children's voices ringing in her ears, and found the dead, still vacancy; and she went to Warehurst one day to see if the home there could not be transferred to the city house.

But that might not be. The mother and aunt were too old for transplanting; their root was struck too deep in the ancestral place, and Jessie was to go as she had come.

She went down, one summer afternoon before departure, to see Emeline, her pretext of work in her hand. She had long since ceased to think that there was any pollution in that presence or that touch; and as she sat there explaining her wishes, one word led to another, and she had told the other of her contrition, something of her grief, much of her loneliness, all her longing. "Oh, Emeline," she said, "the child you have was sent to me! If I had only taken the trust, if I had only taken the boy and left him with my mother, I should have him now—I should not be so utterly alone to-day." As she spoke she glanced up at the open window, and there, swinging in a hammock of the wild smilax that had been strongly twined from bough to bough, the roguish face of a six-years-old boy, framed in close-curling yellow locks, and in a glory of the late afternoon sunshine, was peering in upon her—but little older than her own child would have been had he lived; and she gazed back in a long, forgetful gaze.

But as Emeline listened to those words something turned her pale and cold. What Jessie said was true, she knew; the child had been sent to her, Providence had meant it for her, but yet—

She turned and looked at him herself, and he met the glance with such a broad, true smile of honest love upon his happy face that her heart leaped now, as it always did, to see it and to feel it. Down what a depth of desolation and despair that heart dropped again with the recurring thought! "Oh, why do you come here to torture me?" she cried. And then, at Jessie's wondering look, gathering her faculties to their old self-denying pitch, and bethinking herself of all she might deprive the boy if she thought of herself, "Do you mean," said she, "that if you had him now you would bring him up as a Devlin, educated, respected, well started in the world, as your son?"

"I will educate him any way, Emeline," said Jessie, simply, with no idea of what was struggling in Emeline's heart and soul, "if you will let me—if you will give me back that little share in him."

Then Emeline looked up at her, at the sweet, pale, chastened face, with the golden hair beneath the widow's cap around it—the tremulous lips, the tearful eyes; and, with the glance, she remembered and felt anew all that that face had been to her. Was there any thing she could deny Jessie Warehurst—deny Jessie Devlin?

"He is yours—he is yours!" she whispered; "absolutely yours! Take him. Only take him at once, before I can repent, before I have time to think that all my sunshine goes with him."

"And without you?" said Jessie.

So it came to pass that shortly after Jessie's return to town the key of Emeline's rooms was surrendered, her little property disposed of, and she and her boy had disappeared from Warehurst; while a quiet, dark-eyed woman, singularly young in face for one with hair so gray as hers, moved up and down in Jessie's home on

as equal terms with Jessie as any one not the mistress of the house could be; and a healthy, happy boy romped among the rooms as unawed by all their splendor as though he had been born to them—a boy who had no mother in the world, though two guardian angels spread their wings between him and all harm. Shadows never fell into that home from the day those two people entered it. It was a perfectly harmonious place, where every thing was in tune; for though Emeline had not Jessie's accomplishments, yet the habits of the high-bred households where she had worked had formed her language and her manners, and her sorrows had matured her mind to a wisdom that supplied deficiencies. Sometimes a sort of twilight, yet not quite a shadow, spread there when the maiden aunt brought her severe austerity on a visit to the town; and, while coldly civil, contrived to express what she considered a merited contempt for the companion of her niece—a contempt which Emeline humbly received as merited indeed, but nevertheless felt thankful

and relieved when its giver had departed, and the mild and gentle Mrs. Warehurst had arrived in her stead. But whether approving or disapproving, they kept the secret, and none in the little burgh knew what had become of Emeline and her boy, or ever suspected that Mrs. Devlin's adopted son had any such ignominious origin as Emeline's. A quiet and subdued happiness reigned beneath that roof. The two women, so young in years and yet so old in griefs, had each their sacred memories, unbreathed, and forever to remain unbreathed, even to each other. But a single thing occupied their hearts and thoughts in the present—a single love in which they had absolute communion; and they lived absorbed in the boy—the boy, often wild and wayward in his advancing years, with the moods of depression and fits of exuberant joyousness that a child born as he was born could hardly be without, but always controlled and led by the affection that surrounded him, and that proceeded from two hearts now grown into one.

FREDERICK THE GREAT.

IX.—THE CAMPAIGN OF MORAVIA.

IT was on the 11th of November, 1741, that Frederick, elated with his conquest of Silesia, had returned to Berlin. In commencing the enterprise he had said, "Ambition, interest, and the desire to make the world speak of me, vanquished all, and war was determined on." He had, indeed, succeeded in making the "world speak" of him. He had suddenly become the most prominent man in Europe. Some extolled his exploits. Some, expressed amazement at his perfidy. Many, recognizing his sagacity, and his tremendous energy, sought his alliance. Embassadors from the various courts of Europe crowded his capital. Fourteen sovereign princes, with many foreigners of the highest rank, were counted among the number. The king was in high spirits. While studiously maturing his plans for the future, he assumed the air of a thoughtless man of fashion, and dazzled the eyes and bewildered the minds of his guests with feasts and pageants.

On the 7th of January, 1742, Frederick's eldest brother, William Augustus, was married to Louisa Amelia, a younger sister of the king's neglected wife, Elizabeth. The king himself graced the festival, in gorgeous attire, and very successfully plied all his wonderful arts of fascination. "He appeared," says Bielfeld, "so young, so gay, so graceful, that I could not have refrained from loving him, even if he had been a stranger."

But, in the midst of these scenes of gayety, the king was contemplating the most complicated combinations of diplomacy. Europe was apparently thrown into a state of chaos. It was Frederick's one predominant thought to see what advantages he could secure to Prussia

from the general wreck and ruin. Lord Macaulay, speaking of these scenes, says:

"The selfish rapacity of the king of Prussia gave the signal to his neighbors. His example quieted their sense of shame. The whole world sprang to arms. On the head of Frederick is all the blood which was shed in a war which raged during many years, and in every quarter of the globe—the blood of the column of Fontenoy, the blood of the brave mountaineers who were slaughtered at Culloden. The evils produced by this wickedness were felt in lands where the name of Prussia was unknown. In order that he might rob a neighbor whom he had promised to defend, black men fought on the coast of Coromandel, and red men scalped each other by the great lakes of North America."

As we have stated, Frederick had declared that if any rumor should be spread abroad of the fact that he had entered into a secret treaty with Austria, he would deny it, and would no longer pay any regard to its stipulations. He had adopted the precaution not to affix his signature to any paper. By this ignoble stratagem he had obtained Neisse and Silesia. The rumor of the secret treaty had gone abroad. He had denied it. And now, in accordance with the principles of his peculiar code of honor, he felt himself at liberty to pursue any course which policy might dictate.

Frederick, in his *Histoire de mon Temps*, states that, in the negotiations which at this time took place in Berlin, France pressed the king to bring forward his armies into vigorous co-operation; that England exhorted him to make peace with Austria; that Spain solicited his alliance in her warfare against England; that

Denmark implored his counsel as to the course it was wise for that kingdom to pursue; that Sweden entreated his aid against Russia; that Russia besought his good offices to make peace with the court at Stockholm; and that the German empire, anxious for peace, entreated him to put an end to those troubles which were convulsing all Europe.

The probable object of the Austrian court in revealing the secret treaty of Schnellendorf was to set Frederick and France at variance. Frederick, much exasperated, not only denied the treaty, but professed increased devotion to the interests of Louis XV. The allies, consisting of France, Prussia, Bavaria, and Saxony, now combined to wrest Moravia from Maria Theresa, and annex it to Saxony. This province, governed by a marquis, was a third larger than the State of Massachusetts, and contained a population of about a million and a half. Moravia bounded Silesia on the south. Frederick made a special treaty with the king of Saxony, that the southern boundary of Silesia should be a full German mile, which was between four and five English miles, beyond the line of the river Neisse. With Frederick's usual promptitude, he insisted that commissioners should be immediately sent to put down the boundary stones. France was surprised that the king of Saxony should have consented to the surrender of so important a strip of his territory.

Frederick paid but little regard to his allies, save as he could make them subservient to the accomplishment of his purposes. He pushed his troops forward many leagues south into Moravia, and occupied the important posts of Troppau, Friedenthal, and Olmütz. These places were seized the latter part of December. The king hoped thus to be able, early in the spring, to carry the war to the gates of Vienna.

On the 18th of January, 1742, Frederick visited Dresden, to confer with Augustus III., king of Poland, who was also elector of Saxony, and whose realms were to be increased by the annexation of Moravia. His Polish majesty was a weak man, entirely devoted to pleasure. His irresolute mind, subjected to the dominant energies of the Prussian king, was as clay in the hands of the potter.

"You are now," said Frederick, "by consent of the allies, king of Moravia. Now is the time, now or never, to become so in fact. Push forward your Saxon troops. The Austrian forces are weak in that country. At Iglau, just over the border from Austria, there is a large magazine of military stores, which can easily be seized. Urge forward your troops. The French will contribute strong divisions. I will join you with twenty thousand men. We can at once take possession of Moravia, and perhaps march directly on to Vienna."

Frederick, in describing this interview, writes: "Augustus answered *yes* to every thing, with an air of being convinced, joined to a look of great

ennui. Count Brühl,¹ whom this interview displeased, interrupted it by announcing to his majesty that the Opera was about to commence. Ten kingdoms to conquer would not have kept the king of Poland a minute longer. He went, therefore, to the Opera; and the king of Prussia obtained at once, in spite of those who opposed it, a final decision."²

The next morning, in the intense cold of mid-winter, Frederick set out several hours before daylight for the city of Prague, which the French and Bavarians had captured on the 25th of November. Declining all polite attentions, for business was urgent, he eagerly sought M. De Séchelles, the renowned head of the commissariat department, and made arrangements with him to perform the extremely difficult task of supplying the army with food in a winter's campaign.

The next morning, at an early hour, he again dashed off to the east, toward Glatz, a hundred miles distant, where a portion of the Prussian troops were in cantonments, under the young prince Leopold. Within a week he had ridden over seven hundred miles, commencing his journey every morning as early as four o'clock, and doing a vast amount of business by the way.

It will be remembered that, in the note which M. Valori accidentally dropped, and which Frederick furtively obtained, the minister was instructed by the French court not to give up Glatz to the Prussian king, if he could possibly avoid it. But Frederick had now seized the city, and the region around, by force of arms, and held them with a gripe not to be relaxed. Glatz was a Catholic town. In the convent there was an image of the Virgin, whose tawdry robes had become threadbare and faded. The wife of the Austrian commandant had promised the Virgin a new dress if she would keep the Prussians out of the city. Frederick heard of this. As he took possession of the city, with grim humor he assured the Virgin that she should not lose in consequence of the favor she had shown the Prussians. New and costly garments were immediately provided for her at the expense of the Prussian king.

On the 26th of January, Frederick set out from Glatz, with a strong cortège, for Olmütz, far away to the southeast. This place his troops

¹ Count Brühl was, for many years, the first minister of the king. He was a weak, extravagant man, reveling in voluptuousness. His decisions could always be controlled by an ample bribe. His sole object seemed to be his own personal luxurious indulgence. "Public affairs," he said, "will carry themselves on, provided we do not trouble ourselves about them."

Sir Charles Hanbury Williams, in his letters from Dresden, writes: "Now, as every thing of every kind, from the highest affairs of the state down to operas and hunting, are all in count Brühl's immediate care, I leave you to judge how his post is executed. His expenses are immense. He keeps three hundred servants and as many horses. It is said, and I believe it, that he takes money for every thing the king disposes of in Poland, where they frequently have very great employments to bestow."

² *Histoire de mon Temps.*

had occupied for a month past. His route led through a chain of mountains, whose bleak and dreary defiles were clogged with drifted snow, and swept by freezing gales. It was a dreadful march, accompanied by many disasters and much suffering.

General Stille, one of the aids of Frederick on this expedition, says, that the king with his retinue, mounted and in carriages, pushed forward the first day to Landskron. "It was," he writes, "such a march as I never witnessed before. Through the ice and through the snow, which covered that dreadful chain of mountains between Böhmen and Mähren, we did not arrive till very late. Many of our carriages were broken down, and others were overturned more than once."

Frederick, ever regardless of fatigue and exposure for himself, never spared his followers. It was after midnight of the 28th when the weary column, frost-bitten, hungry, and exhausted, reached Olmütz. The king was hospitably entertained in the fine palace of the Catholic bishop, "a little, gouty man," writes Stille, "about fifty-two years of age, with a countenance open and full of candor."

Orders had been issued for all the Prussian troops to be rendezvoused, by the 5th of February, at Wischau. They were then to march immediately about seventy-five miles west, to Trebitsch, which was but a few miles south of Iglau, the point of attack. Here they were to join the French and Saxon troops. The force thus concentrated would amount to twenty-four thousand Prussian troops, twenty thousand Saxons, and five thousand French horsemen. With this army—forty-nine thousand strong—Frederick was to advance, by one short day's march, upon Iglau, where the Austrian garrison amounted to but ten thousand men.

In the mean time, on the 24th of January, Charles Albert, king of Bavaria, through the intrigues of the French minister and the diplomacy of Frederick, was chosen emperor of Germany. This election Frederick regarded as a great triumph on his part. It was the signal defeat of Austria. Very few of the sons of Adam have passed a more joyless and dreary earthly pilgrimage than was the fortune of Charles Albert. At the time of his election he was forty-five years of age, of moderate stature, polished manners, and merely ordinary abilities. He was suffering from a complication of the most painful disorders. His previous life had been but a series of misfortunes, and during all the rest of his days he was assailed by the storms of adversity. In death alone he found refuge from a life almost without a joy.

Charles Albert, who took the title of "the emperor Charles VII.," was the son of Maximilian, king of Bavaria, who was ruined at Blenheim, and who, being placed under the ban of the empire, lived for many years a pensioner upon the charity of Louis XIV. Charles

was then but seven years of age, a prince by birth, yet homeless, friendless, and in poverty. With varying fortunes, he subsequently married a daughter of the emperor Joseph. She was a cousin of Maria Theresa. Upon the death of his father, in 1726, Charles Albert became king of Bavaria; but he was involved in debt beyond all hope of extrication. The intrigues of Frederick placed upon his wan and wasted brow the imperial crown of Germany. The coronation festivities took place at Frankfurt, with great splendor, on the 12th of February, 1742.

Wilhelmina, who was present, gives a graphic account, with her vivacious pen, of many of the scenes, both tragic and comic, which ensued.

"Of the coronation itself," she writes, "though it was truly grand, I will say nothing. The poor emperor could not enjoy it much. He was dying of gout, and other painful diseases, and could scarcely stand upon his feet. He spends most of his time in bed, courting all manner of German princes. He has managed to lead my margraf into a foolish bargain about raising men for him, which bargain I, on fairly getting sight of it, persuade my margraf to back out of; and, in the end, he does so. The emperor had fallen so ill he was considered even in danger of his life. Poor prince! What a lot he had achieved for himself!"

While these coronation splendors were transpiring, Frederick was striving, with all his characteristic enthusiasm, to push forward his Moravian campaign to a successful issue. Inspired by as tireless energies as ever roused a human heart, he was annoyed beyond measure by the want of efficient co-operation on the part of his less zealous allies. Neither the Saxons nor the French could keep pace with his impetuosity. The princes who led the Saxon troops, the petted sons of kings and nobles, were loth to abandon the luxurious indulgences to which they had been accustomed. When they arrived at a capacious castle where they found warm fires, an abundant larder, and sparkling wines, they would linger there many days, decidedly preferring those comforts to campaigning through the blinding, smothering snow-storm, and bivouacking on the bleak and icy plains, swept by the gales of a northern winter. The French were equally averse to these terrible marches, far more to be dreaded than the battle-field.

Frederick remonstrated, argued, implored; but all in vain. He was not disposed to allow considerations of humanity, regard for suffering or life, to stand in the way of his ambitious plans. For two months, from February 5, when Frederick rendezvoused the Prussians at Wischau, until April 5, he found himself, to his excessive chagrin, unable to accomplish any thing of moment, in consequence of the lukewarmness of his allies. He was annoyed almost beyond endurance. It was indeed important, in a military point of view, that there should be an immediate march upon Iglau. It was cer-

¹ *Campagnes de le Roi de Prusse*, p. 5.

THE YOUNG LORDS OF SAXONY ON A WINTER CAMPAIGN.

tain that the Austrians, forewarned, would soon remove their magazines, or destroy them. The utmost expedition was essential to the success of the enterprise.

The young officers in the Saxon army, having disposed their troops in comfortable barracks, had established their own head-quarters in the magnificent castle of Budischau, in the vicinity of Trebitsch. "Nothing like this superb mansion," writes Stille, "is to be seen except in theatres, on the drop scene of the enchanted castle." Here these young lords made themselves very comfortable. They had food in abundance, luxuriously served, with the choicest wines. Roaring fires in huge stoves converted, within the walls, winter into genial summer. Here these pleasure-loving nobles, with song, and wine, and cards, and such favorites, male and female, as they carried with them, loved to linger.

At length, however, Frederick succeeded in pushing forward a detachment of his army to

seize the magazines and the post he so greatly coveted. The troops marched all night. Toward morning, almost perishing with cold, they built enormous fires. Having warmed their numbed and freezing limbs, they pressed on to Iglau, to find it abandoned by the garrison. The Austrian general Lobkowitz had carried away every thing which could be removed, and then had laid in ashes seventeen magazines, filled with military and commissary stores. The king was exceedingly chagrined by this barren conquest. He was anxious to advance in all directions, to take full possession of Moravia, before the Austrians could send reinforcements to garrison its fortresses. But the Saxon lords refused to march any farther, in this severe winter campaign. Frederick complained to the Saxon king. His Polish majesty sent an angry order to his troops to go forward. Sullenly they obeyed, interposing every obstacle in their power. Some of the leaders threw up their commissions and went home. Fred-

erick, with his impetuous Prussians, and his unwilling Saxons, spread over Moravia, levying contributions and seizing the strong places.

The Saxons, much irritated, were rather more disposed to thwart his plans than to co-operate in them. The Austrian horsemen were vigilant, pouncing upon every unprotected detachment. Frederick marched for the capture of Brünn, the strongest fortress in Moravia. It had a garrison of seven thousand men, under the valiant leader Roth. To arrest the march of Frederick, and leave him shelterless on the plains, the Austrian general laid sixteen villages in ashes. The poor peasants—men, women, and children—foodless and shelterless, were thus cast loose upon the drifted fields. Who can gauge such woes?

Frederick, finding that he could not rely upon the Saxons, sent to Silesia for reinforcements of his own troops. Brünn could not be taken without siege artillery. He was capturing Moravia for the king of Poland. Frede-

rick dispatched a courier to his Polish majesty at Dresden, requesting him immediately to forward the siege guns. The reply of the king, who was voluptuously lounging in his palaces, was, "I can not meet the expense of the carriage." Frederick contemptuously remarked, "He has just purchased a green diamond, which would have carried them thither and back again." The Prussian king sent for siege artillery of his own, drew his lines close around Brünn, and urged chevalier De Saxe, general of the Saxon horse, to co-operate with him energetically, in battering the city into a surrender. The chevalier interposed one obstacle, and another, and another. At last he replied, showing his dispatches, "I have orders to retire from this business altogether, and join the French at Prague."

Frederick declares, in his history, that never were tidings more welcome to him than these. He had embarked in the enterprise for the conquest of Moravia with the allies. He could not,

MAP ILLUSTRATING THE CAMPAIGN IN MORAVIA.

without humiliation, withdraw. But now that the ally in whose behalf he assumed to be fighting had abandoned him, he could, without dishonor, relinquish the field. Leaving the Saxons to themselves, with many bitter words of reproach, he countermanded his order for Silesian reinforcements, assembled his troops at Wischau, and then, by a rapid march through Olmütz, returned to his strong fortresses in the north.

The Saxons were compelled to a precipitate retreat. Their march was long, harassing, and full of suffering, from the severe cold of those latitudes, and from the assaults of the fierce Pandours, every where swarming around. Villages were burned, and maddened men wreaked direful vengeance on each other. Scarcely eight thousand of their number, a frost-bitten, starving, emaciate band, reached the borders of Saxony. Curses loud and deep were heaped upon the name of Frederick. His Polish majesty, though naturally good-natured, was greatly exasperated, in view of the conduct of the Prussian king in forcing the troops into the severities of such a campaign. Frederick himself was also equally indignant with Augustus for his want of co-operation. The French minister, Valori, met him on his return from these disasters. He says that his look was ferocious and dark; that his laugh was bitter and sardonic; that a vein of suppressed rage, mockery, and contempt pervaded every word he uttered.

Frederick withdrew his troops into strong cantonments, in the valley of the upper Elbe. This beautiful river takes its rise in romantic chasms, among the ridges and spurs of the Giant Mountains, on the southeastern borders of Silesia. Here the Prussian army was distributed in small towns along a line following the windings of the stream, about forty miles in length. All the troops could be concentrated in forty-eight hours. The encampments faced the south, with the Elbe behind them. At some little distance north of the river, safe from surprise, the magazines were stationed. The mountains of Bohemia rose sublimely in the distant back-ground. In a letter to M. Jordan, under date of Chrudim, May 5, 1742, Frederick expresses his views of this profitless campaign in the following terms:

"Moravia, which is a very bad country, could not be held, owing to want of provisions. The town of Brünn could not be taken, because the Saxons had no cannon. When you wish to enter a town, you must first make a hole to get in by. Besides, the country has been reduced to such a state that the enemy can not subsist in it, and you will soon see him leave it. There is your little military lesson. I would not have you at a loss what to think of our operations, or what to say, should other people talk of them in your presence."

Elsewhere, Frederick, speaking of these two winter campaigns, says: "Winter campaigns are bad, and should always be avoided, except in cases of necessity. The best army in the

world is liable to be ruined by them. I myself have made more winter campaigns than any general of this age. But there were reasons. In 1740 there were hardly above two Austrian regiments in Silesia, at the death of the emperor Charles VI. Being determined to assert my right to that duchy, I had to try it at once, in winter, and carry the war, if possible, to the banks of the Neisse. Had I waited till spring, we must have begun the war between Crossen and Glogau. What was now to be gained by one march would then have cost us three or four campaigns. A sufficient reason this for campaigning in winter. If I did not succeed in the winter campaigns of 1742, a campaign which I made to deliver Moravia, then overrun by Austrians, it was because the French acted like fools, and the Saxons like traitors."¹

Frederick, establishing his head-quarters at Chrudim, did not suppose the Austrians would think of moving upon him until the middle of June. Not till then would the grass, in that cold region, afford forage. But Maria Theresa was inspired by energies fully equal to those of her renowned assailant. Undismayed by the powerful coalition against her, she sent prince Charles, her brother-in-law, early in May, at the head of an army thirty thousand strong, to advance by a secret, rapid, flank march, and seize the Prussian magazines beyond the Elbe.

The ever-wakeful eye of Frederick detected the movement. His beautiful encampment at Chrudim had lasted but two days. Instantly couriers were dispatched in all directions to rendezvous the Prussian troops on a vast plain in the vicinity of Chrudim. But a few hours elapsed ere every available man in the Prussian ranks was on the march. This movement rendered it necessary for prince Charles to concentrate the Austrian army also. The field upon which these hosts were gathering for battle was an undulating prairie, almost treeless, with here and there a few hamlets of clustered peasant cottages scattered around.

It was a serene, cloudless May morning when Frederick rode upon a small eminence, to view the approach of his troops, and to form them in battle-array. General Stille, who was an eye-witness of the scene, describes the spectacle as one of the most beautiful and magnificent which was ever beheld. The transparent atmosphere, the balmy air, transmitting with wonderful accuracy the most distant sounds, the smooth, wide-spreading prairie, the hamlets, to which distance lent enchantment, surmounted by the towers or spires of the churches, the winding columns of infantry and cavalry, their polished weapons flashing in the sunlight, the waving of silken and gilded banners, while bugle peals and bursts of military airs floated now faintly, and now loudly, upon the ear, the whole scene being bathed in the rays of the most brilliant of spring mornings—all together presented war in its brightest hues, divested of every thing revolting.²

² *Campaigns of the King of Prussia*, p. 57.

FREDERICK CONCENTRATING HIS ARMY AT CHRUDIM.

There were nearly thirty thousand men, infantry and cavalry, thus assembling under the banners of Frederick for battle. They were in as perfect state of drill as troops have ever attained, and were armed with the most potent implements of war which that age could furnish. The king was visibly affected by the spectacle. Whether humane considerations touched his heart, or merely poetic emotion moved him, we can not tell. But he was well aware that within a few hours not merely hundreds, but thousands, of those men, torn by shot and shell, would be prostrate in their blood upon the plain. And he could not but know that

for all the carnage and the suffering he, above all others, would be responsible at the bar of God.

"The king," writes Stille, "though fatigued, would not rest satisfied with reports or distant view. Personally he made the tour of the whole camp, to see that every thing was right, and posted the pickets himself before retiring."

It was the aim of prince Charles to get between Frederick's encampment at Chrudim and his French allies, under marshal Broglio, at Prague. When discovered by Frederick, the Austrian army was on the rapid march along a line about fifteen miles nearly southwest of

Chrudim. It thus threatened to cut Frederick's communication with Prague, which was on the Moldau, about sixty miles west of the Prussian encampment. The forces now gathering for a decisive battle were nearly equal. The reader would not be interested in the description of the strategic and tactical movements of the next two days. The leaders of both parties, with great military sagacity, were accumulating and concentrating their forces for a conflict, which, under the circumstances, would doubtless prove ruinous to the one or the other. A battle upon that open plain, with equal forces, was of the nature of a duel, in which one or the other of the combatants must fall.

On the morning of the 17th of May Frederick's army was drawn out in battle-array, facing south, near the village of Chotusitz, about fifteen miles west of Chrudim. Almost within cannon-shot of him, upon the same plain, near the village of Czaslau, facing north, was the army of prince Charles. The field was like a rolling western prairie, with one or two sluggish streams running through it; and here and there marshes, which neither infantry nor cavalry could traverse. The accompanying map will give the reader an idea of the nature of the ground and the position of the hostile forces.

The sun rose clear and cloudless over the plain, soon to be crimsoned with blood and darkened by the smoke of battle. The Prussians took position in accordance with very minute directions given to the young prince Leopold by Frederick. It was manifest to the most unskilled observer that the storm of battle would rage over many miles, as the infantry charged to and fro; as squadrons of strongly mounted cavalry swept the field; as bullets, balls, and shells were hurled in all directions from the potent enginery of war.

About seven o'clock in the morning the king ascended an eminence, and carefully scanned the field, where sixty thousand men were facing each other, soon to engage in mutual slaughter. There were two spectacles which arrested his attention. The one was the pomp, and pa-

geantry, and panoply of war, with its serried ranks, its prancing steeds, its flashing armor, its waving banners, its inspiring bugle peals—a scene in itself beautiful and sublime in the highest conceivable degree.

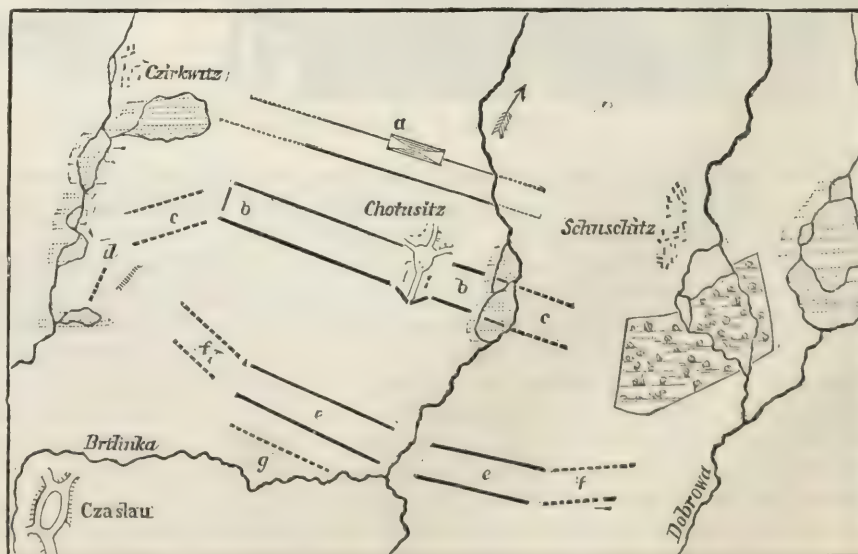

But there was another picture which met the eye of the king, very different in its aspect. We know not whether it at all touched his heart. It was that of the poor peasants, with their mothers, their wives, their children, hurrying from their hamlets in all directions, in the utmost dismay. Grandmothers tottered beneath the burden of infant children. Fathers and mothers struggled on with the household goods they were striving to rescue from impending ruin. The cry of maidens and children reached the ear as they fled from the tramp of the war-horse and the approaching carnage of the death-dealing artillery.

Frederick, having carefully scanned the Austrian lines for an instant or two, gave the signal, and all his batteries opened their thunders. Under cover of that storm of iron, several thousand of the cavalry, led by the veteran general Bredow, deployed from behind some eminences, and first at a gentle trot, and then upon the most impetuous run, with flashing sabres, hurled themselves upon the left wing of the Austrian lines. The ground was dry and sandy, and a prodigious cloud of dust enveloped them. For a moment the tornado, vital with human energies, swept on, apparently unobstructed. The first line of the Austrian horse was met, crushed, annihilated. But the second stood as the rock breasts the waves, horse against horse, rider against rider, sabre against sabre. Nothing met the eye but one vast, eddying whirlpool of dust, as if writhing in volcanic energies, while here and there the flash of fire and the gleam of steel flickered madly through it.

The battle, thus commenced, continued to rage for four long hours, with all its demon energies, its blood, its wounds, its oaths, its shrieks, its death; on the right wing, on the left wing, in the centre; till some ten or twelve thousand, some accounts say more, of these poor peasant

soldiers lay prostrate upon the plain, crushed by the hoof, torn by the bullet, gashed by the sabre. Many were dead. Many were dying. Many had received wounds which would cripple them until they should totter into their graves. At the close of these four hours of almost superhuman effort, the villages all around in flames, the Austrians slowly, sullenly retired from the contest. Prince Charles, having lost nearly seven thousand men, with his remaining forces breathless, exhausted, bleeding, retired through Czaslau, and vanished over the horizon to the southwest. Frederick, with his forces almost equally breathless, exhausted, and bleeding, and counting five thousand of his soldiers strewn over the plain, in death or wounds, remained master of the field. Such was the famous battle of Chotusitz.

In the following terms, Frederick, the moment the battle was over, announced his victory, not to his wife, but to his friend Jordan :

"FROM THE FIELD OF BATTLE OF CHOTUSITZ,
"May 17, 1742.

"DEAR JORDAN,—I must tell you, as gayly as I can, that we have beaten the enemy soundly, and that we are all pretty well after it. Poor Rothenburg is wounded in the breast and in the arm; but, as it is hoped, without danger. Adieu. You will be happy, I think, at the good news I send you. My compliments to Cæsarion."¹

Frederick did not pursue the Austrians after this victory. Nine acres of ground were required to bury the dead. He rented this land from the proprietor for twenty-five years. His alienation from his allies was such that, without regard to them, he was disposed to make peace with Austria upon the best terms he could for himself. England also, alarmed in view of the increasing supremacy of France, was so anxious to detach Frederick, with his invincible troops, from the French alliance, that the British cabinet urged Maria Theresa to make any sacrifice whatever that might be necessary to secure peace with Prussia. Frederick, influenced by such considerations, buried the illustrious Austrian dead with the highest marks of military honor, and treated with marked consideration his distinguished prisoners of war.

Secret negotiations were immediately opened at Breslau, in Silesia, between England, Austria, and Prussia. Maria Theresa, harassed by the entreaties of her cabinet, and by the importunities of the British court, consented to all that Frederick demanded.

The French, who, through their shrewd ambassador, kept themselves informed of all that was transpiring, were quite alarmed in view of the approaching accommodation between Prussia and Austria. It is said that Frederick, on the 6th of June, in reply to the earnest remonstrances of the French minister, marshal Belle-

isle, against his withdrawal from the alliance, frankly said to him :

"All that I ever wanted, more than I ever demanded, Austria now offers me. Can any one blame me that I close such an alliance as ours all along has been, when such terms are presented to me as Austria now proposes?"

On the 15th of June, Frederick gave a grand dinner to his generals at his head-quarters. In an after-dinner speech, he said to them :

"Gentlemen, I announce to you that, as I never wished to oppress the queen of Hungary, I have formed the resolution of agreeing with that princess, and accepting the proposals she has made me, in satisfaction of my rights."

Toasts were then drank with great enthusiasm to the health of "Maria Theresa, queen of Hungary," to "the queen's consort, Francis, grand duke of Lorraine;" and universal and cordial was the response of applause, when the toast was proposed "to the brave prince Charles."

The treaty of Breslau was signed on the 11th of June, and ratified at Berlin on the 28th of July. By this treaty, Silesia, Lower and Upper, was ceded to "Frederick and his heirs for evermore," while Frederick withdrew from the French alliance, and entered into friendly relations with her Hungarian majesty. Immediately after the settlement of this question, Frederick, cantoning his troops in Silesia, returned to Berlin. Elate with victory, and accompanied by a magnificent suit, the young conqueror hastened home, over green fields, and beneath a summer's sun. Keenly he enjoyed his triumph, greeted with the enthusiastic acclaim of the people in all the towns and villages through which he passed.¹ At Frankfort-on-the-Oder, where a fair was in operation, the king stopped for a few hours. Vast crowds, which had been drawn to the place by the fair, lined the highway for a long distance, on both sides, eager to see the victor who had aggrandized Prussia, by adding a large province to its realms.

"His majesty's entrance into Frankfort," writes M. Bielfeld, who accompanied him, "although very triumphant, was far from ostentatious. We passed like lightning before the eyes of the spectators, and were so covered with dust that it was difficult to distinguish the color of our coats and the features of our faces. We made some purchases at Frankfort, and the next day arrived safely in Berlin, where the king was received with the acclamations of his people."²

If we can rely upon the testimony of Frederick, an incident occurred at this time which showed that the French court was as intriguing

¹ Huge huzzaing, herald-trumpeting, bob-major-ing, burst forth from all Prussian towns, especially from all Silesian ones, in those June days, as the drums beat homeward; elaborate illuminations in the short nights, with bonfires, with transparencies; transparency inscribed "Frederico magno (To Frederick the Great)," in one small instance, still of premature nature.

² BIELFELD, 251.

¹ *Correspondence de Frédéric II.*

and unprincipled as was his Prussian majesty. It is quite evident that the Austrian court also was not animated by a very high sense of honor.

After the battle of Chotusitz Frederick called upon general Pallant, an Austrian officer, who was wounded and a prisoner. In the course of the conversation general Pallant stated that France was ready at any moment to betray his Prussian majesty, and that, if he would give him six days' time, he would furnish him with documentary proof. A courier was instantly dispatched to Vienna. He soon returned with a letter from cardinal Fleury, the prime minister of Louis XV., addressed to Maria Theresa, informing her that, if she would give up Bohemia to the emperor, France would *guarantee to her Silesia*. Frederick, though guilty of precisely the same treachery himself, read the document with indignation, and assumed to be as much amazed at the perfidy as he could have been had he been an honest man.

"The cardinal," he said, "takes me for a fool. He wishes to betray me. I will try and prevent him."

The French marshal, Belleisle, alarmed by the report that Frederick was entering into a treaty of peace with Austria, hastened to the Prussian camp to ascertain the truth or falsehood of the rumor. Frederick, emboldened by the document he had in his pocket, was very frank.

"I have prescribed," he said, "the conditions of peace to the queen of Hungary. She accepts them. Having, therefore, all that I want, I make peace. All the world in my situation would do the same."

"Is it possible, sire," marshal Belleisle replied, "that you can dare to abandon the best of your allies, and to deceive so illustrious a monarch as the king of France?"

"And you, sir," responded the king, with an air of great disdain, at the same time placing in his hand the cardinal's letter, "do you dare to talk to me in this manner?"

The marshal glanced his eye over the document, and retired, overwhelmed with confusion. Thus ended the alliance between Prussia and France. "Each party," writes Frederick, "wished to be more cunning than the other."¹

In the following terms, Frederick correctly sums up the incidents of the two Silesian campaigns:

"Thus was Silesia reunited to the dominions of Prussia. Two years of war sufficed for the conquest of this important province. The treasure which the late king had left was nearly exhausted. But it is a cheap purchase, where whole provinces are bought for seven or eight millions of crowns. The union of circumstances at the moment peculiarly favored this enterprise. It was necessary for it that France should allow itself to be drawn into the war; that Russia should be attacked by Sweden;

that, from timidity, the Hanoverians and Saxons should remain inactive; that the successes of the Prussians should be uninterrupted; and that the king of England, the enemy of Prussia, should become, in spite of himself, the instrument of its aggrandizement. What, however, contributed the most to this conquest was, an army which had been formed for twenty-two years, by means of a discipline admirable in itself, and superior to the troops of the rest of Europe. Generals, also, who were true patriots, wise and incorruptible ministers, and, finally, a certain good fortune which often accompanies youth, and often deserts a more advanced age."¹

There was no end to the panegyrics which Voltaire, in his correspondence with Frederick, now lavished upon him. He greeted him with the title of Frederick the Great.

"How glorious," he exclaimed, "is my king, the youngest of kings, and the grandest! A king who carries in the one hand an all-conquering sword, but in the other a blessed olive branch, and is the arbiter of Europe for peace or war."

Frederick, having obtained all that, for the present, he could hope to obtain, deemed it for his interest to attempt to promote the peace of Europe. His realms needed consolidating, his army recruiting, his treasury replenishing. But he found it much easier to stir up the elements of strife than to allay them.

His withdrawal from the French alliance removed the menace from the English Hanoverian possession. George II. eagerly sent an army of sixty thousand men to the aid of Maria Theresa against France, and freely opened to her his purse. The French were defeated every where. They were driven from Prague, in one of the most disastrous wintry retreats of blood and misery over which the demon of war ever gloated. The powerless, penniless emperor, the creature of France, who had neither purse nor army, was driven, a fugitive and a vagabond, from his petty realm of Bavaria, and was exposed to humiliation, want, and insult.

Maria Theresa was developing character which attracted the admiration of Europe. She seriously contemplated taking command of her armies herself. She loved duke Francis, her husband, treated him very tenderly, and was anxious to confer upon him honor; but by nature vastly his superior, instinctively she assumed the command. She led; he followed. She was a magnificent rider. Her form was the perfection of grace. Her beautiful, pensive, thoughtful face was tanned by the weather. All hearts throbbed as, on a spirited charger, she sometimes swept before the ranks of the army, with her gorgeous retinue, appearing and disappearing like a meteor. She was as devout as she was brave, winning the homage of all Catholic hearts. We know not where, in the long list of sovereigns, to point to man

¹ *Histoire de mon Temps.*

¹ BIELFELD, 251.

MARIA THERESA AT THE HEAD OF HER ARMY.

or woman of more imperial energies, of more exalted worth.

The loss of Silesia she regarded as an act of pure highway robbery. It rankled in her noble heart as the great humiliation and disgrace of her reign. Frederick was to her but as a hated and successful bandit, who had wrenched from her crown one of its brightest jewels. To the last day of her life she never ceased to deplore the loss. It is said that if any stranger, obtaining an audience, was announced as from Silesia, the eyes of the queen would instantly flood with tears. But the fortunes of war had now triumphantly turned in her favor. Aided

by the armies and the gold of England, she was on the high career of conquest. Her troops had overrun Bohemia and Bavaria. She was disposed to hold those territories, in compensation for Silesia, which she had lost.

In the mean time, during the two years in which Maria Theresa was making these conquests, Frederick, alarmed by the aggrandizement of Austria, and the weakening of France, while unavailingly striving to promote peace, was busily employed in the administration of his internal affairs. He encouraged letters; devoted much attention to the Academy of Arts and Sciences; reared the most beautiful

opera-house in Europe; devoted large sums to secure the finest musicians and the most exquisite ballet dancers which Europe could afford. He sought to make his capital attractive to all those throughout Europe who were inspired by a thirst for knowledge, or who were in the pursuit of pleasure.

One incident in this connection, illustrative of the man and of the times, merits brief notice. His agent at Venice reported a female dancer there of rare attainments, Señora Barberina. She was marvelously beautiful, and a perfect fairy in figure and grace, and as fascinating in her vivacity and sparkling intelligence as she was lovely in person. Frederick immediately ordered her to be engaged for his opera-house at Berlin, at a salary of nearly four thousand dollars, and sundry perquisites.

But it so happened that the beautiful dancer had in the train of her impassioned admirers a young English gentleman, a younger brother of the earl of Bute. He was opposed to Barberina's going to Prussia, and induced her to throw up the engagement. Frederick was angry, and demanded the execution of the contract. The pretty Barberina, safe in Venice, made herself merry with the complaints of the Prussian monarch. Frederick, not accustomed to be thwarted, applied to the doge and the senate of Venice to compel Barberina to fulfill her contract. They replied with great politeness, but did nothing. Barberina remained with her lover under the sunny skies of Italy, charming with her graceful pirouettes admiring audiences in the Venetian theatres.

In the mean time a Venetian ambassador, on his way to one of the northern courts, passed a night at a hotel in Berlin. He was immediately arrested, with his luggage, by a royal order. A dispatch was transmitted to Venice, stating that the ambassador would be held as a hostage till Barberina was sent to Prussia. "A bargain," says Frederick, in his emphatic utterance, "is a bargain. A state should have law courts to enforce contracts entered into in their territories."

The doge and senate were brought to terms. They seized the beautiful Barberina, placed her carefully in a post-chaise, and, under an escort of armed men, sent her, from stage to stage, over mountain and valley, till she arrived at Berlin. The Venetian ambassador was then discharged. The young English gentleman, James Mackenzie, a grandson of the celebrated advocate, sir George Mackenzie, eagerly followed his captured innamorata, and reached Berlin two hours after Barberina. The rumor was circulated that he was about to marry her.

It is said that Frederick, determined not to lose his dancer in that manner, immediately informed the young gentleman's friends that he was about to form a *mesalliance* with an opera girl. The impassioned lover was peremptorily summoned home. Hatred for Frederick consequently rankled in young Mackenzie's heart. This hatred he communicated to his brother,

lord Bute, which subsequently had no little influence in affairs of national diplomacy.

The king himself became much fascinated with the personal loveliness and the sparkling intelligence of the young dancer. He even condescended to take tea with her, in company with others. Not long after her arrival in Berlin, she made a conquest of a young gentleman of one of the first Prussian families, M. Cocceji, son of the celebrated chancellor, and was privately married to him. For a time Barberina continued upon the stage. At length, in the enjoyment of ample wealth, she purchased a splendid mansion, and, publicly announcing her marriage, retired with her husband to private life. But the mother of Cocceji, and other proud family friends, scorned the lowly alliance. A divorce was the result. Soon after Barberina was married to a nobleman of high rank, and we hear of her no more.

Though Frederick, in his private correspondence, often spoke very contemptuously of Voltaire, it would seem, if any reliance can be placed on the testimony of Voltaire himself, that Frederick sedulously courted the author, whose pen was then so potential in Europe. By express invitation, Voltaire spent a week with Frederick at Aix la Chapelle, early in September, 1742. He writes to a friend from Brussels, under date of December 10:

"I have been to see the king of Prussia. I have courageously resisted his fine proposals. He offers me a beautiful house in Berlin, a pretty estate, but I prefer my second-floor in madame Du Châtelet's here. He assures me of his favor, of the perfect freedom I should have; and I am running to Paris, to my slavery and persecution. I could fancy myself a small Athenian refusing the bounties of the king of Persia; with this difference, however, one had liberty at Athens."

Again he writes, under the same date, to the marquis D'Argenson:

"I have just been to see the king of Prussia. I have seen him as one seldom sees kings, much at my ease, in my own room, in the chimney-corner, whither the same man who has gained two battles would come and talk familiarly, as Scipio did with Terence. You will tell me I am not Terence. True; but neither is he altogether Scipio."

Again he writes, under the same date, to cardinal De Fleury, then the most prominent member of the cabinet of Louis XV.:

"MONSEIGNEUR,—I am bound to give your excellency some account of my journey to Aix la Chapelle. I could not leave Brussels until the second of this month. On the road I met a courier from the king of Prussia, coming to reiterate his master's orders on me. The king had me lodged in quarters near his own apartment. He passed, for two consecutive days, four hours at a time in my room, with all that goodness and familiarity which form, as you know, part of his character, and which does not lower the king's dignity, because one is duly

careful not to abuse it. I had abundant time to speak with a great deal of freedom on what your excellency had prescribed to me, and the king spoke to me with an equal frankness.

"First he asked me 'if it were true that the French nation were so angered against him, if the king was, and if you were.' I answered 'that there was nothing permanent.' He then condescended to speak fully upon the reasons which induced him to make peace. These reasons were so remarkable that I dare not trust them to this paper. All that I dare say is, that it seems to me easy to lead back the mind of this sovereign, whom the situation of his territories, his interest, and his taste, would appear to mark as the natural ally of France. He said, moreover, 'that he earnestly desired to see Bohemia in the emperor's hands, that he renounced all claim on Berg and Jülich, and that he thought only of keeping Silesia.' He said 'that he knew well enough that the house of Austria would one day wish to recover that fine province, but that he trusted he could keep his conquest. That he had at that time a hundred and thirty thousand soldiers perfectly prepared for war; that he would make of Neisse, Glogau, and Brieg fortresses as strong as Wesel; that he was well informed that the queen of Hungary owed eighty million German crowns (\$60,000,000); that her provinces, exhausted and wide apart, would not be able to make long efforts; and that the Austrians for a long time to come could not of themselves be formidable.'"¹

Frederick was accustomed to cover his deep designs of diplomacy by the promotion of the utmost gayety in his capital. Never did Berlin exhibit such spectacles of festivity and pleasure as during the winter of 1742 and 1743.

¹ It would seem that Voltaire was sent to Frederick as the secret agent and spy of the French minister. "Voltaire," writes Macaulay, "was received with every mark of respect and friendship. The negotiation was of an extraordinary description. Nothing can be conceived more whimsical than the conferences which took place between the first literary man and the first practical man of the age, whom a strange weakness had induced to change their parts. The great poet would talk of nothing but treaties and guarantees; and the king of nothing but metaphors and rhymes. On one occasion, Voltaire put into his majesty's hand a paper on the state of Europe, and received it back with verses scrawled on the margin. In secret they both laughed at each other. Voltaire did not spare the king's poems, and the king has left on record his opinion of Voltaire's diplomacy, saying, "He had no credentials, and the whole mission was a mere farce."

As a specimen of the character of the document above alluded to, we give the following. Voltaire, in what he deemed a very important state paper, had remarked:

"The partisans of Austria burn with the desire to open the campaign in Silesia again. Have you, in that case, any ally but France? And however potent you are, is an ally useless to you?"

The king scribbled on the margin

"Mon ami,
Don't you see
We will receive them
A la Barbari!"

There was a continued succession of operas, balls, fêtes, and sleigh-parties. Frederick's two younger sisters were at that time brilliant ornaments of his court. They were both remarkably beautiful and vivacious. The princess Louise Ulrique was in her twenty-third year. The following letter to Frederick, from these two princesses, will be keenly appreciated by many of our young lady readers, whose expenses have exceeded their allowance. It shows very conclusively that there may be the same pecuniary annoyances in the palaces of kings as in more humble homes.

"BERLIN, 1st of March, 1743.

"MY DEAREST BROTHER,—I know not if it is not too bold to trouble your majesty on private affairs. But the great confidence my sister and I have in your kindness encourages us to lay before you a sincere avowal of our little finances, which are a good deal deranged just now. The revenues, having for two years and a half past been rather small, amounting to only four hundred crowns (\$300) a year, could not be made to cover all the little expenses required in the adjustment of ladies. This circumstance, added to our card-playing, though small, which we could not dispense with, has led us into debt. Mine amounts to fifteen hundred crowns (\$1125); my sister's, to eighteen hundred crowns (\$1350). We have not spoken of it to the queen-mother, though we are sure she would have tried to assist us. But as that could not have been done without some inconvenience to her, and as she would have retrenched in some of her own little entertainments, I thought we should do better to apply directly to your majesty. We were persuaded you would have taken it amiss had we deprived the queen of her smallest pleasure, and especially as we consider you, my dear brother, the father of the family, and hope you will be so gracious as to help us. We shall never forget the kind acts of your majesty. We beg you to be persuaded of the perfect and tender attachment with which we are proud to be, all our lives, your majesty's most humble sisters and servants.

LOUISE ULRIQUE,

"ANN AMELIA.

"P.S. — I most humbly beg your majesty not to speak of this to the queen-mother, as perhaps she would not approve of the step we are now taking.

ANN AMELIA."¹

About this time Frederick was somewhat alarmed by a statement issued by the court of Austria, that the emperor, Charles Albert, was no legitimate emperor at all; that the election was not valid; and that Austria, which had the emperor's kingdom of Bavaria by the throat, insisted upon compensation for the Silesia she had lost. It was evident that Maria Theresa, whose armies were every where successful, was determined that her husband, duke Francis,

¹ *Œuvres de Frédéric*, XXVII., i. 387.

should be decorated with the imperial crown. It now seemed probable that she would be able to accomplish her design. Frederick was alarmed, and deemed it necessary to strengthen himself by matrimonial alliances.

The heir to the Russian throne was an orphan boy, Peter Federowitz. The Russian court was looking around to obtain for him a suitable wife. Frederick's commandant at Stettin, a man of renowned lineage, had a beautiful daughter of fourteen. She was a buxom girl, full of life as she frolicked upon the ramparts of the fortress with her young companions. Frederick succeeded in obtaining her betrothal to the young prince of Russia. She was solemnly transferred from the Protestant to the Greek religion; her name was changed to Catherine; and she was eventually married, greatly to the satisfaction of Frederick, to the young Russian czar.

Adolph Frederick was the heir to the throne of Sweden. Successful diplomacy brought a magnificent embassy from Stockholm to Berlin, to demand princess Ulrique as the bride of Sweden's future king. The course of love, whether true or false, certainly did in this case run smooth. The marriage ceremony was attended in Berlin with such splendor as the Prussian capital had never witnessed before. The beautiful Ulrique was very much beloved. She was married by proxy, her brother Augustus William standing in the place of the bridegroom.

All eyes were dimmed with tears as, after a week of brilliant festivities, she prepared for her departure. The carriages were at the door to convey her, with her accompanying suit of lords and ladies, to Stralsund, where the Swedish Senate and nobles were to receive her. The princess entered the royal apartment to take leave of her friends, dressed in a rose-colored riding-habit, trimmed with silver. The vest which encircled her slender waist was of sea-green, with lappets and collar of the same. She wore a small English bonnet of black velvet with a white plume. Her flowing hair hung in ringlets over her shoulders, bound with rose-colored ribbon.

The king, who was devotedly attached to his sister, and who was very fond, on all occasions, of composing rhymes which he called poetry, wrote a very tender ode, bidding her adieu. It commenced with the words:

*"Partez, ma Sœur, partez;
La Suède vous attend, la Suède
vous désire."*

*Go, my Sister, go;
Sweden waits you, Sweden
wishes you.*

"His majesty gave it to her at the moment when she was about to take leave of the two queens. The princess threw her eyes on it and fell into a faint. The king had almost done the like. His tears flowed abundantly. The princes and princesses were overcome with sorrow. At last Gotter judged it time to put an

end to this tragic scene. He entered the hall almost like Boreas in the ballet of "The Rose"—that is to say, with a crash. He made one or two whirlwinds, clove the press, and snatched away the princess from the arms of the queen-mother, took her in his own, and whisked her out of the hall. All the world followed. The carriages were waiting in the court; and the princess in a moment found herself in hers.

"I was in such a state I know not how we got down stairs. I remember only that it was in a concert of lamentable sobbings. Madame, the marchioness of Schwedt, who had been named to attend the princess to Stralsund, on the Swedish frontier, this high lady, and the two dames D'Atours, who were for Sweden itself, having sprung into the same carriage, the door of it was shut with a slam, the postillions cracked, the carriage shot away, and disappeared from our eyes. In a moment the king and court lost sight of the beloved Ulrique forever."¹

Frederick was far from being an amiable man. He would often cruelly banter his companions, knowing that it was impossible for them to indulge in any retort. Baron Pöllnitz was a very weak old man, who had several times changed his religion to subserve his private interests. He had been rather a petted courtier during three reigns. Now in extreme old age, and weary of the world, he wished to renounce Protestantism, and to enter the cloisters of the convent in preparation for death. He applied to the king for permission to do so. Frederick furnished him with the following sarcastic parting testimony. It was widely circulated through many of the journals of that day, exciting peals of laughter as a capital royal joke:

"Whereas the baron De Pöllnitz, born of honest parents, so far as we know, having served our grandfather as gentleman of the chamber, madame D'Orleans in the same rank, the king of Spain as colonel, the deceased emperor Charles VI. as captain of horse, the pope as chamberlain, the duke of Brunswick as chamberlain, the duke of Weimar as ensign, our father as chamberlain, and, in fine, *us* as grand master of ceremonies, has, notwithstanding such accumulation of honors, become disgusted with the world, and requests of us a parting testimony;

"We, remembering his important services to our house, in diverting for nine years long the late king our father, and doing the honors of our court through the now reign, can not refuse such request. We do hereby certify that the said baron Pöllnitz has never assassinated, robbed on the highway, poisoned, forcibly cut purses, or done other atrocity or legal crime at our court; but that he has always maintained gentlemanly behavior, making not more than honest use of the industry and talents he has been endowed with at birth; imitating the ob-

¹ Letters of Bielfeld, i. 188.

ject of the drama—that is, correcting mankind by gentle quizzing—following in the matter of sobriety Boerhaave's counsels, pushing Christian charity so far as often to make the rich understand that it is more blessed to give than to receive; possessing perfectly the anecdotes of our various mansions, especially of our worn-out furnitures, rendering himself by his merits necessary to those who know him, and, with a very bad head, having a very good heart.

"Our anger the said baron Pöllnitz never kindled but once.¹ But as the loveliest countries have their barren spots, the most beautiful forms their imperfections, pictures by the greatest masters their faults, we are willing to cover with the veil of oblivion those of the said baron. We do hereby grant him, with regret, the leave of absence he requires, and abolish

his office altogether, that it may be blotted from the memory of man, not judging that any one, after the said baron, can be worthy to fill it.

"FREDERICK.

"POTSDAM, April 1, 1744."

No man of kindly sympathies could have thus wantonly wounded the feelings of a poor old man who had, according to his capacity, served himself, his father, and his grandfather, and who was just dropping into the grave. A generous heart would have forgotten the foibles, and, remembering only the virtues, would have spoken words of cheer to the world-weary heart, seeking a sad refuge in the glooms of the cloister. It must be confessed that Frederick often manifested one of the worst traits in human nature. He took pleasure in inflicting pain upon others.

THE OLD LOVE AGAIN.

BY ANNIE THOMAS.

CHAPTER IV.

"THE WOMAN WHO HESITATES?"

THAT letter of Gerald Barrington's was only one of the many mistakes the man had been in the habit of making all his life. When Miss Delany had gone out of his path at the great gates of the Vicarage grounds, he ought to have bowed his head and accepted her exit as final, and his wife's presence as inevitable, and so a thing to be borne philosophically. Instead of doing this, however, he must needs write to the one and remonstrate with the other—wronging them both a little by the tone he took.

Ardleigh End was some little distance from the Vicarage entrance. On ordinary occasions Mrs. Barrington would have deemed it too far to walk. But she was spared all sense of fatigue this day by her strong sense of wifely injury.

She maintained a blighting silence for a minute or two after Miss Delany left them—and, be it remembered, a minute or two is a very long time when two angry people are walking together in a country lane. In any amusing street—that is, in any street that is well supplied with shops—a savage wife can get over the time with an apparently unconcerned air. But between Ardleigh Vicarage and Ardleigh End there was nothing to be bought. At last she spoke; and though she was a boisterous, underbred woman, who had never touched his heart or his taste, there was something pathetic in her eyes and her voice and her manner. He could not help acknowledging this to himself.

"I believe I suffered more than either of you did, Gerald, just now, when I came upon you in that wood."

"A self-sought punishment. How could you bring yourself to wrong yourself and me by coming 'upon us,' as you term it, in that way?" he said, coldly.

"Why didn't you say outright you knew her? Why didn't she say it? Why did you both try to deceive me, Gerald?"

"Be careful what you say."

"You can't wonder at my speaking the truth, however careless I may be of my own comfort in doing it. You think I am always to be without feeling because I have had to bear coldness from your grand friends. You forget that I am your lawful wife, it seems to me."

"Would to Heaven I could forget it!"

"Oh, Gerald, those are cruel words!"

"And your words were cruel, when the way you became my lawful wife is considered. Was I not put by you and yours in a position that no honorable man could extricate himself from honorably? You were cruel to me, Harriet. Have I ever reproached you with it?"

"Not in words, certainly," she said, drying the tears that had sprung into her eyes.

"No, not in words, nor in act either. I have given you every comfort and luxury that money can command. You married for them, and you have had them."

"I wanted something more, Gerald—I did, indeed; frivolous as you think me, and empty-headed, I would give all the comforts and luxuries for your love and respect."

"Such an appeal from you to me degrades us both still more than we are already degraded," he said, coldly. "When you forgot your maiden modesty, and forced yourself upon an unwilling man, you could not have cared for his love or respect."

"But, as a wife who has always done her duty, I have a right to your confidence," she said, recovering her spirit and her color. "And I ask you now what I have done that both Miss

¹ In Pöllnitz's memoirs and letters he repeated the rumor that the great elector's second wife, an ancestress of Frederick, had attempted to poison her stepson.

Delany and you should stoop—yes, stoop—to deceive me? I ask you, too, which of us looked the guilty, faulty, ‘unmaidenly’ woman when I came upon you just now? I ask you—”

“You have asked too many questions already, Harriet,” he interrupted; and by this time they had come into the Ardleigh End grounds, and he was able to turn away to the stables.

He sauntered about among his horses for some little time, and then he went in and rang for some luncheon to be brought to him in his own study. Mrs. Barrington was not gifted with reticence. He knew, from fatal experience, that she would go on, before the servants, reproaching and recriminating and reviling; and he shrank from public mention being made of Miss Delany’s name.

At last he decided that it was simply his duty as a man, simply what was due from him as a courteous gentleman, that he should write to Nina, and apologize to her for “any thing that might have transpired that morning to annoy or wound her.” He would cast no more open blame upon his wife than was conveyed in those quoted words. If he never saw Nina again, she should not have such a painful last impression of him as she must have now.

Accordingly, he wrote a few discreet, blameless words to Miss Delany, and then, before he signed his name, he paused. There was something else he longed to say, but he hesitated much about saying it. At last he scribbled it down hastily, signed, sealed, and sent the letter, and then tried to think that he had acted wisely.

The last few words were an urgent request that she would see him “once more—when, and where, and how she pleased—but once more, alone, he prayed her to see him.”

Until dinner-time that day Nina Delany sat by herself and debated as to the advisability of doing as he, the only man she had ever loved in all her life, requested her to do. By dinner-time she had advanced a stage, and had begun to question concerning the possibility of doing so. “Shall I attempt it?” had been her first question to herself. “Shall I succeed in doing it without compromising him at all?” was all she asked herself now.

Miss Delany quite made up her mind to consult Mrs. Eldon on the subject. “Gertrude is very sensible and very kind-hearted,” she said to herself; “it will be better for me to take her advice.” But when she went down to dinner, it seemed to her that it would be a very hard thing to open her heart to her friend. Gertrude evidently thought that there had been want of wisdom shown by Miss Delany in the Barrington affair. “How you can give a second thought to a man who was found to be worthless once, and who has consoled himself with such a commonplace woman, I can’t imagine,” Mrs. Eldon said, speaking with that little air of astonishment and suppressed censure which is so very hard to endure.

“Perhaps not; but then you see, Gertrude, you never gave your first love-thoughts to Gerald Barrington,” Miss Delany replied; and at the same moment she resolved that Gertrude was not a fit and proper person in whom to confide this further difficulty of hers.

“And really, Nina, to be quite outspoken and just, I can’t wonder at Mrs. Barrington being less than civil when she came upon you this morning.”

“Came upon us! What a phrase to use!”

“Well, when she met you; there had been secrecy observed against her,” Mrs. Eldon said, patting her own hand rather vehemently with a paper-knife. This conversation took place when the two ladies were alone in the drawing-room, after dinner, and were, therefore, unfettered in the expression of their thoughts by Mr. Eldon’s presence.

“There has been no secrecy observed against her. I can not feel that it was due to her for me to analyze, in her presence, the likelihood of the Gerald Barrington whom she married being the same Gerald Barrington I was once going to marry; I can not feel that I owed it to her to rake over the ashes of that past to which he belongs.” Miss Delany said these words warmly; and simultaneously with her warm speech was born the resolve to write and appoint a last meeting with Gerald Barrington that same night.

“Then he ought to have told her,” Mrs. Eldon persisted; “yes, Nina, indeed he ought to have done so. You would agree with me if you gave yourself time to think. She’s neither a nice, nor a lady-like, nor a particularly good woman, I should think, but, for all that, she is his wife.”

This last assertion was unanswerable, and the former part of the speech was unflattering in its air of reprobation and resolution. Miss Delany therefore said nothing, but sat looking out through the open window, away into the deepening shadows that were hanging over the wood where she had been strolling with Gerald Barrington in the morning. “He shall always be my very dear friend, though he can never be more now,” she thought; “no one shall teach me to shun him—no one shall guide my hand, and cause it to stab him any more;” and in her heart, as she said this, she forgave him freely all that “unworthiness” of which he had been accused, and of which she had once believed him capable.

The next morning she walked down into the village and posted a note to him. “In common courtesy, I must grant your request,” she wrote, and then she had hesitated a good deal as to where she would say she would see him. “It’s Gertrude’s fault that I don’t say here,” she said to herself, as her pen halted. Then, after the pause of a few moments, she went on quickly and firmly, “I can not invite you here, as would be seemly; but I will meet you on the platform of the Sedgwick Station, at twelve o’clock to-morrow.”

CHAPTER V.

AN ERROR OF JUDGMENT.

THE Sedgwick platform was a very natural place for Miss Delany to be on at the hour of twelve. Sedgwick itself—an aspiring country town—was broad awake and in full dress by that time, as the numerous country ladies who thronged its clean streets, and gazed admiringly into its shop windows, could testify. Miss Delany had selected her hour advisedly. She knew that there would be so many people upon the platform then that the presence and the meeting of Mr. Barrington and herself would be in nowise remarkable.

The girl was sorely harassed in her own mind about this which she was doing, though she told herself over and over again that she was quite right in doing it. There was a loyalty to the man whom she had married to be observed, as well as toward the woman he had married. There should be nothing light, frivolous, and volatile about the tone of their talk. "It shall be like a funeral service—as solemn and as sad," she said to herself; and, indeed, she looked upon it as the funeral service to be read over the ashes of the past.

So she ordained; but alas! she could not act thus, in spite of so ordaining. She was too unlike a mourner come to bury forever solemnly the ashes of the past, as she stepped out of the carriage on to the platform—far too unlike a mourner in her bright summer dress and brighter beauty for Gerald Barrington to be penitential about her and the past. While as for her, he looked far too heartily rejoiced to see her for any woman to strike the right key-note of sadness which was to pervade the whole melody of the meeting.

There were dozens of people upon the platform. The majority of them were ladies, the wives of priests and deacons and squires and farmers from the neighboring villages. They were nearly all of them intent, wholly and solely intent it appeared, upon getting away from the platform, and up into the Sedgwick streets and shops, as soon as possible. Still for all this a few of them had time to bow to Mr. Barrington, and glance suspiciously at his companion, as they hurried along to the wicket of exit.

"Where shall we go?" Mr. Barrington said, as they gave up their tickets and got out into the road. Eager as he had been to see her, delighted as he was to see her, still he was beginning to feel, and to feel keenly, the awkwardness of their position.

"I have shopping to do," Nina said, hurriedly; "we had better walk up to the shops at once."

"And meet all those women again?" he said, complainingly.

"I care very little whether I meet 'those women' again or not," Miss Delany said, haughtily; but though she spoke haughtily, she paused in her path to the town, and evidently expected him to propose another.

"Of course it's a matter of very minor importance whether we see them again or not," he said, with affected carelessness and real confusion; "still I thought it would be better to have a few quiet words than a disjointed conversation subject to continual interruptions from passing acquaintances."

"I will walk whichever way you like for half an hour," she said then, though her reason told her that she was unwise in not going into the watchful, gossiping little town at once. So then they turned and sauntered along an unfrequented lane for half an hour, and then retraced their steps into Sedgwick, and had the pleasure of seeing themselves curiously surveyed from every shop door and window as they passed.

And all this for what? for what, indeed? Just for the sake of testing the vague expectation each had that the other had something to say which would make their past relations pleasanter to look upon. A vague expectation which was not realized, for they spent the solitary walk in saying little things which had a deep meaning to the utterer and none at all to the hearer, and in trying to counteract the impropriety of having met at all by rendering the meeting unsatisfactory by an air of too late prudence and caution.

As for what they said, every word of it might have been written down and read by Mrs. Barrington without causing her one jealous pang. Nina began by saying that the road was very dusty, but that, for her part, she preferred dust to mud, and, indeed, preferred every attribute of summer to any one of winter. When Gerald had assented to this harmless proposition the ball of conversation ceased to roll for several yards. The solitude they had sought so rashly and eagerly was too much for them, in fact. At last Miss Delany tried again.

"I think you will find the Eldons a great acquisition to your society," she said; "indeed, they are both so absolutely charming by nature and habit, and from cultivation and custom, that they would be an acquisition to any society."

"I am not sure that I shall stay at Ardleigh End. I hate the place now."

She did not ask him why he hated it now; but she blushed with a consciousness she hated herself for betraying; and the folly she had been guilty of in coming here at all was more vividly before her than ever.

"Where do you think of going when you leave Ardleigh End?" she said.

"Where? Out of the world soon, I hope," he said, deplorably.

"But as you can't go out of the world till your appointed time, where do you think of living in the interim?"

She said this spiritedly, meaning to rouse him; for it struck her that there was something pusillanimous in his last words.

"Abroad, I suppose. Situated as I am, I shall meet with fewer mortifications abroad."

And to that she could say nothing; for now

THE PRIVATE ROOM.

she dared not sympathize with him about the mortifications he was subjected to on account of his wife.

"I am longing to go abroad too," she said, after a pause. "And if papa hadn't married, he meant to take me to Spain this summer. But Lady Delany shrinks from the idea of Spanish travel, or, indeed, of any travel that is not perfectly easy and unadventurous and luxurious."

"I was surprised to hear of Sir Arthur marrying again."

"Were you? Well, I must say I was always fully prepared for any eccentricity on papa's part."

"Is your new step-mother congenial to you?"

"My new step-mother is—my step-mother; and I have no doubt that she is quite as congenial to me as I am to her. She's very young and pretty, and I am in her way—and she shows that I am in her way. But you must not imagine from that statement that she either beats me or starves me," she added, laughing.

Then the half hour was up, and they left off sauntering, and hastily retraced their steps into Sedgwick.

It was past one when they entered the little town, and during the whole hour that they had been together not a word had been said between them that would not just as satisfactorily have been left unsaid. Their being together had been such a poor pleasure that the proceeding was already robbed of all its criminality in Nina's eyes; while as for Gerald Barrington, by reason of being baffled, he was feel-

ing more infatuated, more in love, more hopeless and miserable than ever.

Moreover, now that it had come to the point, he felt the full awkwardness of meeting a lot of people whom he knew, in the street, after that hour's solitary stroll with Nina. "Why didn't I do as she wished, and come here straight from the station?" he thought, self-reproachfully. "If I hear her gabbled about, it will be all up with my peace of mind."

"I must do my shopping now," Nina said. "I want to go to a glass shop and a bookseller's."

"You must have luncheon. We may as well go and have it before your shopping," he said.

"I don't care for luncheon," Nina replied. But, in truth, she was very hungry, and she only said she did not care for luncheon because she did not know where it would be well for her to go, and what it would be well for her to do.

"Here; we can go to this confectioner's," Mr. Barrington said, pausing at the door of a pastry-cook's shop. But even as he spoke there was borne out upon the air such an odor of rancid butter, greasy pastry, strong soup, and burned sugar that Nina revolted and refused to enter.

"No—that's impossible," Gerald Barrington said, hastily; "there are dead flies about on every thing. But you must have some luncheon; you're looking pale and worn out. Come on; I know another place." And he led her on to the corner of the High Street, and pulled up at the entrance of a comfortable inn.

"But this is an—an hotel," Nina said, hesitatingly.

"I needn't assure you that it is a thoroughly respectable one, Miss Delany," he said, ushering her in. And then he called for a private room, and Nina, with burning cheeks, walked in and took possession of it.

He ordered luncheon, and, there being the customary delay, in about a quarter of an hour he went out to hurry it. Presently Nina, anxiously listening to every sound, heard his voice in the passage.

"Yes, I came in by the twelve o'clock train. I fancied I saw you on the platform, Mrs. Simcox, but I was not quite sure."

"That was not Mrs. Barrington with you, was it?" a shrill female voice, pitched in a high key, replied.

"No. I came alone."

"But you were not alone. I said to Mrs. Verney, 'Look! that is not Mrs. Barrington—that lady standing by Mr. Barrington?' But before Mrs. Verney could look you had passed out of sight."

"Really, there were so many ladies standing near me on the platform that I am at a loss to identify the one you mean," Mr. Barrington said, good-humoredly. And Nina, who heard him say it, almost groaned as she muttered to herself, "He has to prevaricate, in order to shield me."

"I am worn out with the heat, and the fatigue of going from shop to shop," Mrs. Simcox then said, in a dilapidated tone. "You would scarcely believe what I have to do, Mr. Barrington, when I come into Sedgwick. Fortunately for you, you don't know what providing for a large family means."

Miss Delany heard Mrs. Simcox utter this sentence, and experienced intense relief from so hearing. Poor Nina thought that the excellent lady with the inquiring mind was ceasing from her quest of the "something" which Mr. Barrington was concealing from her. Alas! Mrs. Simcox was only the more surely on the track.

"I mustn't keep you standing any longer," Gerald Barrington said, courteously.

"I shall be glad to go and sit down while I'm waiting for the train," Mrs. Simcox said, piteously. "I came here for some luncheon, but I can't get a room; has any one got that room you came out of?"

"Yes," Gerald said, boldly; "it is already taken."

"And have you failed in getting a private room—not that it matters for a gentleman?"

"Yes, I have a room," Gerald said, getting himself into a deplorable difficulty through speaking the truth.

"Then let me—I'm an old woman, and it doesn't matter, you know—join you, Mr. Barrington. I'm sure your wife would be the first to advise me to do it; where have you ordered luncheon?"

A waiter coming up at the moment, with a

tray full of viands in his hands, heard the interrogation, threw the door of the room in which Nina was sitting open, and stepped back, in order to let Mrs. Simcox walk in. Mrs. Simcox was in the room before Gerald could remonstrate. And Miss Delany was surveying the intruder with flashing eyes and flushing cheeks, but with a confused, agitated air, withal, that looked like guilt.

"I beg your pardon Mr. Barrington," Mrs. Simcox said, with offensive emphasis, looking quickly from Nina to Gerald. "I wouldn't on any account—exceedingly awkward, I am sure." And the lady turned in the midst of her condemnatory, affectedly apologetic mutterings to leave the room.

"You need not apologize to me," Mr. Barrington said, boldly. Then he remembered that the fine-eared waiter was present, and that if he said the room was not his (Gerald's), but Miss Delany's, that the truth would be questioned and canvassed in the hotel kitchen, bar, and stable-yard. So he paused, and Mrs. Simcox took advantage to bustle, with awfully significant haste, out of the room. Then the waiter withdrew—merely to the other side of the door—when something interested him at the hinges, and Miss Delany spoke:

"The first links of a chain of unpleasantness formed by my own folly; that woman will see that I suffer for my indiscretion."

"Don't speak so bitterly," he said, imploringly. "In blaming yourself you blame me so heavily. Who could have foreseen this? and, after all, it is nothing."

"No; nothing," she said, shaking her head slowly, and looking at him. "But it's just one of the nothings that bud into such mischief and misery. It's all nothing. We came here for nothing definitely; we have said and done nothing satisfactory; and now—well, it's no use moralizing." She rose up hastily, drew near to the table, and commenced eating her luncheon; but he saw that her eyes were full of tears, and that her hand trembled.

While he sat gazing at her, dejectedly, she lifted her eyes to his face, and, seeing the pain depicted there, she pitied him more than herself, and so said.

"Whatever comes of this outbreak of mistaken judgment on our—on my part, Mr. Barrington, you shall find that I have a heart for any fate, and that I don't much care for misrepresentation; still, if I may venture to advise you—" She paused; and he said, quickly:

"Do! Whatever you suggest I will do only too gladly."

"Then, I say, tell your wife, as soon as you get home, that you met me here, and that you looked after my comfort. The simple truth often takes the sting out of the most subtle mischief-making. Promise me you will tell her."

He had promised her that whatever she suggested he would do gladly; but this suggestion of hers was, as it happened, just the very one that was peculiarly unpalatable to him. He

would willingly do any thing save tell his wife that Nina, in order to oblige him, had been guilty of an error of judgment. Accordingly, he hesitated to give the promise she asked for; and, at length, gave it conditionally.

"I will tell her, if I think it necessary," he said. And it was borne in upon Nina that there was an element of weakness in the nature of this old love of hers. She was stung suddenly by a feeling that she had loved something less than herself—always an unpleasant conviction.

The time came for them to walk down to the station to catch the train that should carry them back to Ardleigh, and they walked down and caught the train, and were carried back to Ardleigh; still without saying one word that they might not just as easily and properly have said before a concourse of people; still without arriving at any thing like a satisfactory conclusion concerning the mystery of that parting in the past which they had come out avowedly to solve. When they took leave of each other at Ardleigh, Nina looked weak, weary, and worn-out, and disgusted with herself and every one else; and she felt as she looked.

It was late in the afternoon when Miss Delany reached the Vicarage. Mr. and Mrs. Eldon were out riding, but they had left word that, if she liked to go and meet them, they were gone to Cranborough, and on the Cranborough road she would surely find them. A horse was standing in the stable ready to be saddled for her use. "Cranborough! I don't know which is the Cranborough road," she said to the servant who gave her the message. "What is Cranborough—a village or a town?"

"It's Mrs. Simcox's place, please, Miss," the servant answered, promptly. "Mrs. Simcox is a widow lady, and Cranborough is a most beautiful place, Miss, if you haven't chanced to see it."

Miss Delany hadn't chanced to see it—did not care to chance to see either it or its owner, at the mention of whose name her heart sickened with a dread that she scarcely dared to own.

"The saddle needn't be put on," she said; "I'm tired. Bring a cup of tea to my room, and then let me be undisturbed until it's time to dress for dinner."
